ABATING THE MOSQUITO PLAGUE.

THE summer residents of Monmouth Beach, New Jersey, have this year accomplished a work of mosquito extermination which should have wide publicity because of the good results achieved and the practicability of putting into operation the same expedients in other mosquito-plagued places. Monmouth Beach is on the New Jersey coast, fifty miles from New York. It lies on a narrow peninsula between the ocean and the Shrewsbury River, and is the summer home of many New York business men, who have handsome summer residences there. Back of the beach there are great stretches of marsh land, which in the past have been the breeding grounds of billions of mosquitoes, and the plague of the insects has been a serious detriment to the enjoyment of life at Monmouth Beach. For several years the use of kerosene had been adopted, in the well-known method of oiling the stagnant waters where the mosquitoes bred, but while this had been attended with some beneficial results, the mosquito destruction had not been permanent, nor in any way adequate. This year it was resolved to undertake heroic measures which should do away with the breeding grounds. The Monmouth Beach Protective Association subscribed the necessary funds, and entrusted the undertaking to Mr. Eugene Winship, superintendent of the Monmouth Beach Country Club.

The plan adopted by Mr. Winship was to cut ditches through the salt marsh of Raccoon Island, which lies directly back of Monmouth Beach, and through the marsh land to the south of it along the Shrewsbury River, this being the territory in which, because of a constant stagnant water supply, mosquitoes multiplied, and whence they were borne by the wind to great distances. The entire territory was very carefully surveyed, and a system of ditches aggregating 70,000 feet in length was so laid out as to drain every pool and permit a circulation of tide water throughout the entire territory. A force of fifty men, equipped with long, narrow spades, was set to digging. The main ditches were so planned as to connect with the river, while the tributary ways led to and from the pools. If a pool was shallow it was dug deeper, in order that there might be a new flow into it and out from it with every recurring tide. Not only did these ditches drain the surface of the marsh, thus removing the breeding holes of the mosquitoes, but they admitted the killie fishes to every water part of the territory, and the hordes of fishes devoured the hordes of wigglers.

In carrying out this plan, Mr. Winship encountered some opposition from certain landowners, men who belong to that variety of the human species which reasons that what has been should be, and which is content to be bitten of mosquitoes as its forefathers were bitten before it. Such opposition, however, was speedily disarmed when Mr. Winship expressed a determination to put into operation the new mosquito law enacted by the New Jersey Legislature, which gives local authorities power to condemn mosquito breeding places as nuisances, which must be abated at the expense of the owner. Indeed, when the financial considerations involved were presented to the average property owner, he was quite ready to recognize the advantages of mosquito extermination as a favorable factor in the determining of the value of his real estate. On this phase of the subject, Mr. Winship said to a New York Herald reporter last April: "If the authorities in the various communities which are infested by the mosquito pest would look carefully into the matter, they would see that from many viewpoints it is to their interest to clear up the mosquito breeding grounds. They would thus not only be ridding their communities of the mosquitoes to a great extent, but the value of the near-by property, especially for summer residences, would be increased to an extent far in excess of the amount which would have to be expended in draining the marshes. It is difficult, of course, to say how much more valuable New Jersey property would become if there were no mosquitoes, but it is safe enough to estimate it at millions of dollars. Compared with this the amount which would have to be spent to do away with mosquitoes is insignificant."

The Monmouth Beach people spent in the enterprise some \$1,200, a sum about equal to what had already been expended in the kerosene warfare carried on during the preceding seasons, and which had afforded only temporary relief. This new system of ditches, it was reasoned, would be in the nature of a permanent improve-

ment. Once the ditches were dug, it would be required in the future to give only such attention as might be necessary to keep them clean of clumps of earth and tufts of grass, and open at the mouths where they debouched into the river; and all this could be done by one man at a very slight annual expense. The event has borne out the anticipation of the projectors. Under date of June 25, Mr. Winship writes us:

"The actual results we have obtained have been more than satisfactory. There is no doubt, in my mind, that ditching and draining, if properly executed, will exterminate the mosquito. Consequently I very earnestly recommend its adoption in any and all localities that are troubled with the pests."

What has been done in the case of Monmouth Beach might well be undertaken in other places where like conditions prevail. If the mosquito breeding grounds are in marsh land, the man with a spade may be employed to ditch them. If the breeding ground be a swamp or a stagnant pond, the work may be more arduous and expensive; but nevertheless will it be well worth the doing, to the end that human comfort may be enhanced and life made better worth the living. There is here a large and profitable field of labor for village improvement associations, suburban citizens' leagues, and individual property owners and philanthropists.

NEWFOUNDLAND CARIBOU.

IN FOREST AND STREAM of April 30, mention was made of a great slaughter of caribou on the Newfoundland coast, the number killed now being reported to be 2,200. In that note it was pointed out that the Newfoundland Government was likely to take some action in the matter, looking to the better protection of the caribou. Recently in the Newfoundland Legislature it was announced that a magistrate armed with special powers had been despatched to the scene of slaughter, with instructions to mete out punishment to the offenders to the full extent of the law. Sir Robert Bond, the Premier, intimated that the Government purposed to introduce a measure that would protect the caribou in future and prevent a recurrence of any such outrage. Caribou have been long most wastefully slaughtered in Newfoundland, and last winter it was a common sight to see carcasses piled up in front of the business places of local auctioneers, and the venison was sold all winter for a few cents a pound. Not many years ago a man sold a hundred carcasses to French fishermen for fish bait, and in some years more animals have been killed than could be eaten, so that the carcasses had to be thrown into the sea. It is hoped that the measure to be enacted by the Government will stop this waste, and that such action will ultimately be taken as will preserve the herds of caribou.

INDIANAPOLIS.

WHILE the Interstate Association's great annual event, the Grand American Handicap at Targets, held at Indianapolis last week, demonstrated that trapshooting is a good and approved national sport, it also demonstrated, contrary to preconceived opinions of many people, that it possesses spectacular features of intense interest to the better classes of society who seek wholesome diversion for its own sake.

The numerous spectators were gentlemen and ladies, well dressed, refined in deportment, and appreciative observers of the competition. The contestants were men who have useful parts in the affairs of life. Many of them were eminent in business, in politics, in the professional and social world, and in the world of finance. They were of the substantial classes who give stability and prestige to a nation.

With such a conspicuous success in the social phases of the shoot under the auspices of the Indianapolis Gun Club, the natural query is suggested as to why it was, so, and why some other clubs have not been equally successful in this respect. The answer is to be found in two distinct features of the club—the personnel and the grounds. It is an amateur association of gentlemen who are interested in trapshooting for sport's sake. The grounds are equipped to meet fully the demands of competition, and to insure the comfort of visitors. The latter feature is commonly neglected or omitted by many clubs. Well dressed ladies and gentlemen, who are accustomed to neatness, comfortable accommodations, and æsthetic sur-

roundings, will not patronize any sport which has not these essentials. The finest opera, lecture, or what not, would be a failure if the audience was provided with muddy standing room, crowded and jostled constantly by others, with obstructed view as a constant.

The Indianapolis Gun Club has set a standard concerning the essentials which make a tournament pleasant to the contestants and make it of interest to the public. The grounds were pleasant to look upon. There was plenty of room. Chairs and cool, open tents provided comfortable seats. Admission was by ticket without cost, but no objectionable people could enter. Of course, all clubs who hold tournaments cannot provide such commodious and well equipped grounds, nor can such clubs hope to gain the esteem and attention of the best people of society.

The club which aspires to secure the G. A. H. for 1905 will perforce have to be prepared to offer inducements equal to what the Indianapolis Gun Club provided in the way of grounds and equipment for the great event last week. The full success of the G. A. H. requires that its public features are important and merit recognition quite as much as the features which are purely competitive.

RUSSELL SAGE ON VACATIONS.

TO A recent vacation number of the Independent Russell Sage contributed an article on the "Injustice of Vacations," in which he wrote: "During the eighty-eight years of my career I have not once taken a vacation. I have never been an advocate of what some term the 'vacation habit.' When I was a boy the practice was not in vogue." He could not see anything legitimate in a vacation; clerks had no right to ask one; they were better off without it; a man ought so to love his work that he would not want a vacation. "If I had a thousand tongues," he declared, "I'd preach 'save time' with them all."

In the current number of the Independent the editors comment upon the ungracious way in which Mr. Sage's anti-vacation notions have been received by the press. The argument of a large proportion of the critics, they say, may be reduced to the following syllogism: "I want a vacation; Russell Sage does not want a vacation. Therefore, down with Russell Sage." Which will appear to most sensible men as simply carrying out the Scriptural injunction to answer a fool according to his folly.

For may it not be said that the unfavorable criticism and scant courtesy shown simply voiced the prompt popular recognition of the fact that a person who has never taken a vacation should be the last on earth to presume to pass judgment on those who do take vacations? What can this man, who has spent all his life accumulating money, know about vacations? and why should anyone ask him to write of something he shows himself so densely ignorant of? If advice were wanted about making a million, one might very well seek it of Russell Sage. But the fact is that there are multitudes interested in knowing where, when, and how they may achieve their vacation this summer, to one who is concerned to know how he might make a million, or who would care to make a million, if in the accumulation of it he converted himself into a money grubber incapacitated for enjoying the good things of the outdoor world, which calls to him with a thousand tongues to come out of the city streets and look upon the green fields, and thread the forest mazes, and cast his fly in the foaming rapids.

LIKE Boston, Chicago, Paris, and other cities, New York now has a refuge for the shelter of friendless dogs, decrepit horses, and other helpless domestic animals. The Bide-a-Wee Home has been established at Yonkers Park, adjoining the city, for the reception and care of such creatures. There is in connection a hospital for the dogs, and the horses are provided with shady pasture. As opportunities offer, permanent homes elsewhere are secured for the dogs. The institution is supported by subscription, and is under the direction of a board of New York women, whose names afford a guarantee that it will be well conducted. The Bide-a-Wee Home plan should be welcomed by owners of old dogs and old horses, who recognize that their pets have outlived their usefulness, yet who cannot bring themselves either to put them into other hands or to end their lives.

THE SPORTSMAN TOURIST

Concerning a Certain Idiosyncrasy of Anglers.

HERE in the Pennsylvania Alleghenies, with streams containing trout in greater or less quantities within a day's drive, the trout fisherman flourishes in all his glory, and the opening of the season for catching these speckled beauties is an event before which a presidential election or a war with Spain pales to insignificance. On this great day every angler starts out promptly.

To an outsider the most remarkable thing about the opening of the season is not the fish nor the fisherman, not the success nor failure of the trip, not even the size of the catch nor of the fish, but only the fact that yearly becomes more apparent, namely, when the season opens these lovers of the art *must* go a-fishing; that no amount of certainty that the trip will come to nothing—that conditions are such as to absolutely prohibit their catching any trout—can't keep them at home.

Being only a woman, with all the usual limitations of the sex, I can look at this matter only with a woman's eye, and this is the question that comes most frequently to my mind: If anglers go fishing to catch fish, as they undoubtedly do, despite the assertions of enthusiasts that this is not the great reason, why don't they go where it is most likely they will succeed? What can a day or a week matter, except as a passing disappointment? Why must they start on the minute? I am, of course, willing to admit that conditions here may have bred a different species of the genus angler than flourishes in less favored spots. Still, the question remains.

This is the way it goes every year. The season opens on the fifteenth of April. This is the actual season when trout may be legally caught. For enthusiasts, however, the real season, so far as enjoyment goes, begins about the first of February. Sometimes, in mild winters, it makes a hesitating start as early as the first of January. This is what might be termed the preparatory stage, and is absolutely indispensable to the proper appreciation of the real season when it does arrive. Among the anglers that I have had the most opportunity to observe, it is every year considered perfectly proper to discuss fishing—in a general and impersonal way—after the first of January; but no angler who has any regard for his reputation would think of making definite plans, of getting out his tackle—even to inspect it—or even of ordering his rubber boots, until after the first of February. Even then he rarely permits himself to speak with decision on the subject, realizing well, at this time, the chances that are against him. After the first of February, however, I have noticed the angler becomes bolder; talks openly of his intentions, plans his trips, considers his equipment, begins to hurry up his work, to save his money, and to show a deep-seated concern over the condition of the streams and of the weather generally. These trips, I have observed, are still sufficiently distant that he will invite everybody to go with him. Only acquaintances of very recent date, or those who have not profited by the experiences of the years gone by, place any dependence on these invitations.

Later on more aggravated symptoms appear, and rods, nets, and other tackle are brought out and overhauled. As March draws to a close, and the early days of April come, a state of nervous expectancy takes the place of the calm consideration of earlier days, and by the fifteenth of April the angler has talked and thought and dreamed himself into such a frame of mind that he can't stay at home if he tries, no matter, as I said, what the condition of the weather or of the streams, or what the chance may be of his catching trout. This fine frenzy, I am glad to say, soon wears off, and by the end of a few trips the angler becomes once more a rational man. But when the season opens—the minute it opens—the angler *must* go. Let me illustrate:

Recently there occurred a winter of such unusual severity that even an angler with his eyes fixed firmly ahead and all his other senses in a comatose condition, must have known that the ice was unusually heavy, the weather cold, and that we came up to the fifteenth of April nearly a month behind the usual condition of things. Indeed, reports were freely circulated, coming from seemingly reliable sources, that at various places where the early trout is wont to await the angler, they were blasting the logs out of the ice. But—did the anglers stay at home until it warmed up, the ice melted, and the much-sought-for trout came forth from his winter quarters? Not one of them. They started promptly at the time set. They found it cold—bitter cold. Ice froze every night. They caught nothing. The trout had not left the deep water where they had lain all winter, and had neither curiosity nor hunger to prompt them to investigate even the most tempting bait. Now, every angler knew how it would be before he started, but he couldn't stay at home.

Another year that I recall, conditions were different, but not a whit more encouraging. It was an early spring. That is, spring made a fine show of appearing early in March, came with a bound over night, as she sometimes does. The warm days she brought with her melted the snow and ice, and as a result the streams were very high all through March and April. Besides being warm, it rained a great deal. When the great day—the fifteenth of April—dawned, there was a six-foot flood in

the nearest creek, the old 'Sock; every stream in the State was out of bounds; it was raining hard, and had rained with heart-breaking persistency for three days and nights before. Did the trout fishermen go? Of course they went! Whole wagonloads of them went; young and old alike, with hearts like the hearts of boys. Weeks before they had set the hour for starting, and they *had* to go.

Another year another state of things existed. The weather had been all right, and the streams were in such a state that the fishermen's hopes ran high, and they were able to make their preparations with much quieter consciences than usual. The newspapers, even, vied with each other in reciting the admirable conditions, and the tremendous numbers of trout waiting to be caught. Now another difficulty arose in the particular group of anglers of whom I know most. One of the keenest of them all injured his leg; it seemed seriously hurt; he suffered intensely; his groans echoed through the house; the doctor was constantly required; he appeared entirely incapacitated. Such was the condition on the evening of the fourteenth. Did he go with the others? Go? Of course he went! He couldn't stay at home. At the usual hour, armed with crutches and canes, he swung himself out of the house, was pushed and pulled and hoisted into the wagon, and the party proceeded. I am obliged, in justice, to add that, although disabled, he did catch one trout from a boat tied to the bank!

Yet another year things were in even worse shape. Everybody was sick when the sacred fifteenth arrived, not only the anglers, but most of their families. One fisherman was just recovering from typhoid fever; another had coughed for six weeks; another had his entire family down with the measles, and a fourth possessed a new son, not yet three days old. Did they go a-fishing? Of course they went, every one of them. They *had* to go.

The only case that I know of that parallels this of the anglers, is furnished by a little old lady who lives up the street. She rents several small houses and oversees them most vigorously. On the first day of every March she invariably takes out and stores away for the summer all the cellar windows of every one of these houses. No matter what the weather, nor what the chances that everything in the cellar will freeze up, out these windows come on the first day of March. I presume she *has* to.

Several of the anglers have tried this same method with other things. For several years one of them planted his garden on the first day of April—so that he might have nothing on his mind when the great day came. Some times he even stuck his peas with brush. The second or third year proved late and cold and everything froze clear to the ground, and had to be replanted. He was even heard to assert that the pea-brush was so injured by the frost that it could not be used for the later crop. But he learned better, and gardened after that by the weather.

The same year he dug his potatoes and put away his celery on a convenient date in the early fall that he had settled upon as proper. This time it stayed warm. The celery rotted, every stalk of it, and the potatoes turned all shades of green and were good for nothing. In this case, also, he learned better, and put away his crops with strict reference to the weather thereafter. So I know that anglers *can* be reasonable.

I am, as I said, only a woman, but I know what the upshot would be if I said about Christmas time, "On the fifteenth of April I shall put away all of the family's winter underwear," and stuck to it, or made any other similar arrangement.

Of course, I am not going to deny that in following the apparently inflexible rule of the anglers concerning their behavior on the first of the season, sometimes things go well. The skies are sometimes the true April skies; the sun is warm, the water is right, the roads are good, the trout are where they should be, and in a proper frame of mind; the right man has charge of the boarding place, the lunch proves just the thing, and the anglers bring home trout—whole dish-pans full of trout—and their hearts are satisfied. Neither shall I deny that there may be exceptions to the aforementioned rule. In fact, a rumor was current in the neighborhood this spring of an angler—a real angler—who stayed at home of his own free will and dug garden the day the season opened, and it did not open on a Sunday, either. The angler in question is admitted to be well past seventy years, and it is not denied that this is the first opening he has missed since he was seventeen. None the less the rumor remains unverified, and I myself am sure, from my knowledge of the genus, that upon investigation it will prove untrue; that if said angler were able to dig garden, he did not dig it—he went a-fishing!

JUSTINA JOHNSON.

"L'Habitat"

NEW YORK, June 16.—*Editor Forest and Stream:* In your issue of June 4 there appears a story by W. W. Brown, entitled, "L'Habitat." I take this opportunity of writing you a word in commendation of this sketch. Being a native of New England, and having enjoyed similar experiences, this story touched a responsive chord, and was read with interest. I shall look for more stories of this nature in future issues of your publication.

H. K. McCANN.

A Summer in Newfoundland.—II.

(Continued from page 520)

At nine o'clock, only two hours behind scheduled time, the train pulled out slowly from the wharf, and was soon speeding over the narrowest or narrow-gauge railroads, well on toward the Grand Codroy River. This stream is one of the largest and surest for big salmon anywhere on the island. It is also the most accessible from the continent, and is consequently the most fished. At that early date we learned that many of the best pools were already taken, and, sadly enough, that no less than fourteen sportsmen were camped along its banks. One of them—a gray-haired angler nearly eighty years of age—had killed his record fish, a 35-pounder, just as the train crossed the trestle. He was one of the old reliables, and had not missed a season on the Codroy for many years. He could always be found early each summer camped by his favorite pool; but this was the first time that the old man's strength had failed him when put to the test, for this time he had needed the assistance of his guides, one on either side propping him up as he handled the long two-handed rod. May all such old anglers live on to fish by the brightest rivers and the purest waters; may their last casts be strong and sturdy, and may they be rewarded by the finest and heaviest that the pool affords.

Once more the little engine starts with angry puffings, the wheels turn, and soon the Codroy, far behind, glistens in the distance like a thread of silver. It is a splendid river, and affords very early fishing, but we passed on, reluctantly leaving to the thirteen sportsmen and the old angler the enjoyment of their pools in peace; no doubt they are the better friends with us for so doing. A stream with too many people roaming along its banks is often more unsatisfactory than one with too few fish in its waters, but where all the pools are your own, and your camp-fire is the only one that shines out into the woods at night.

After passing Grand Codroy, the next stream large enough to warrant fish in respectable numbers or size is Crabb's Brook; while further on Little Barachois, Robinson's and Fischell's are just about as good as Crabb's. The latter is deep and wide at the mouth, and should yield an early run of salmon, at least in the lower reaches near the ocean. Fischell's is a beautiful brook, long and winding, with many pools; but unfortunately it is so narrow and shallow, especially at the sea, that the fish are late in running in, and during dry seasons many of the larger ones do not enter at all, but move on up the coast for deeper water. Robinson's is much the same, but contains more water, is deeper, and the pools are nearer together than in Fischell's. Flat Bay Brook, a few miles further up the coast, is a good stream, especially in the deep, broad pools near its mouth. The latter, however, is completely shut off from the open ocean by Sandy Point, and as a rule salmon do not ascend in any numbers until quite late in the season. Bottom, Main River, and Harry's Brooks are all first rate rivers, the former for trout, the latter, once famous for big salmon, still records the capture of several heavy fish each season. It has never been my good fortune to cast over the deep, dark waters of the Humber; flowing through rocky cañons and between high granite cliffs, it is unquestionably the grandest, most majestic river in Newfoundland. About forty miles from the coast a great fall prevents many of the fish from ascending further, and in the pool below first-class sport should be found. One gentleman whom I met on his way to the Humber, told me that this pool was so large as to require the use of a canoe or dory, but that it held many salmon, thirty-six falling to his rod in two weeks during the season of 1902.

The reader must not suppose that the streams named above are the only ones in Newfoundland, or that they contain more than a very small proportion of the total number of salmon. Two excellent rivers flow into Hawke's Bay on the northwest coast, while many of the southern waters, and the Exploits, lower Terra Nova, and Salmonier—the latter for small fish—are said to offer grand sport, although I have had no opportunity to verify the statement from my own personal experience. Of late years netting has been judiciously restricted at the mouth of the Gander; it is fished but little, and probably contains more and larger salmon than any other river on the island, with perhaps the possible exception of the Exploits.

The sun had set and night was fast approaching when our train, squeaking loudly on the tracks as it rounded the last curve, drew up in front of a squalid log hut, which, as section house, marked our destination. It had been a long journey over the rails. At almost every brook sportsmen had been getting off, and it was with great satisfaction that we watched the train pull out, leaving only ourselves on the platform. William and Jim were there waiting, and a little in the rear John, the untried cook, a bashful youth of some twenty years, mentally sized up our appetites, as, doffing his cap, he awaited salutations. Old Jim, the head guide, was a quiet little man of about sixty, brown, sinewy, and accustomed to work of the hardest kind. He scorned the cod or hering fisheries as a means of livelihood, but had lived his life as a trapper among the hills of the interior, and, to use his own words, spent every winter since boyhood "a"

furrin' in de hoods." A huge red beard completely concealed the lower half of the old man's face, while a straw hat, torn and battered, left us in ignorance of the rest of his physiognomy. That straw hat was certainly in the last days of the "sere and yellow leaf," but Jim was proud of it, none the less, for it was made by Dunlap, and the year before had even graced the head of a New York "sporter." William boasted pure French ancestors, but his swarthy complexion and greasy black hair savored strongly of a more humbler lineage. When I suggested the possibility of Indian origin, he quickly and emphatically showed his contempt for the entire race. The cook's clothes were covered with many variegated patches, while a pair of huge boots added to an appearance which was naturally grotesque. But aside from his garb, he betrayed no evidences of individuality whatever, always remaining just plain John, and strong as a horse and as willing a packer as ever carried a load, but as a cook he had missed his vocation. John could brew the bitterest tea, mix the toughest bread, and boil the soggiest dumplings that mortal man ever digested and survived; but after learning the proper proportion of American baking powder with section house flour, he rapidly improved, and we left him as proficient in the culinary art as the average Newfoundland cook—which is not saying a great deal.

Our brook was some twelve miles distant, to be reached by dory along the coast, and as it was already dark, we camped by the tracks to dream of the morrow—dreams such as only an angler knows—of pools filled with monster salmon and of great speckled trout chasing each other for the fly.

Daylight saw the party seated in two dilapidated dories, with outfit and provisions securely packed on spruce boughs in the stern, well up out of reach of the water, which leaked in little rivulets in from between the planks. The ocean, calm and placid as a pond, was so clear that objects far below appeared distinct against the white sands of the bottom. Great jagged rocks dotted the shore, and here and there their dark shapes loomed black above the surface of the sea. Long salmon and herring nets stretched at intervals far out from the beach, while numerous little black buoys indicated that "lobstering" was an industry extensively carried on. Occasionally a dirty little hut, perched at the head of a cove, marked the site of a "factory," where the lobsters are boiled, opened, packed in cans, and finally shipped to St. John's for export. Sea birds were not as frequent along the bluffs as I had expected, and only a few species were noticed. Common terns, it is true, were abundant; but aside from them, merely a few black-backed and herring gulls floating on the ocean, a flock of noisy crows in the spruces, a solitary raven stalking majestically on the sand, and high up among the clouds the plaintive whistle of a yellow-leg, varied the monotonous thumping of Jim's home-made oars, as the dories crawled slowly toward their destination.

It was a long, tedious day, and well toward evening when at last the boats turned in at a narrow fresh-water channel marking the river. The latter, Jim explained, was long and winding, drawing its waters from a series of unfrequented and unnamed ponds fifty miles back in the interior. Three excellent pools were situated close to the ocean; ten miles up stream six or seven more followed in quick succession for five miles, while still further on, some three days' tramp above the upper pools, the Grand Fall, which prevented the salmon from ascending, was the surest spot of all. Practically no rain had fallen since early May. Consequently, every stream in Newfoundland was dryer and shallower than customary at that time; and as I subsequently found to my sorrow, the whole summer proved one long, exasperating drought. In view of this condition of the water, our guide proposed a plan of attack which seemed wisely conceived, and sure of ultimate success, namely, to camp by the ocean until rain raised the water sufficiently to allow the salmon to enter the lower pools, then to follow the fish up stream and remain for a week at the upper pools, and finally to pack forty miles across the hills to the Grand Fall. This would carry me to the middle of August, and to the end of the salmon season, but it would leave me right in the heart of caribou country as fine as any in the colony, if not in the world.

The first day we fished persistently with great hopes, but without a rise; the second became a repetition of the first, and the third of the second, but with slightly moderated enthusiasm. All possible combinations of flies, coupled with the piscatorial skill of the entire party, failed utterly and completely. Thursday, the fourth day, proved a calm; not a breath stirred the water, and the three pools were calm and glassy; but not one fish could be seen, either lying on the white sands of the shoal or stemming the swift water by the pool's head, or lurking in the dark hole under the big rock. One thing was certain—there were no salmon. The salmon had not arrived; yet during all this time hundreds of fat sea trout were jumping in the brackish water below camp.

That evening, as we sat around the fire discussing the situation and the prospects for rain, an old man appeared, bearing in one hand some lobsters fresh from the factory, and in the other a great salmon just taken from the nets. The former could be purchased for five cents each, and they were purchased very quickly, too, as we had not tasted fish or meat for nearly a week. I fear, however, that I spoke rather harshly to the old man when he offered me his salmon at four cents a pound. To come a thousand miles for the very purpose of killing one, to fail, and then to have one dangled before your eyes, and that for sale, was certainly adding insult to injury. That old man never fully grasped the meaning of my explanation, and if asked could not to this very day tell why the two hungry fishermen refused to buy his fish. A Newfoundland fisherman never can thoroughly comprehend the sportsman's idea of sport. His hunting means packing meat for hungry mouths, and his fishing means hauling trawls and baiting cod hooks; perhaps he has a right to his opinion that "de sporters be a foolish people to come t' Newfoundland."

Early Friday morning, just at the turn of the rising tide, I stood kneedeep in the foam and cast out into the current for sea trout. Just where the surf broke and breakers swelled in at the river's narrow channel, was the place; and my very first cast was rewarded by a sharp tug as a good sized fish struck the dropper below the

surface. In a twinkling, Dugmore had unlimbered his big Graflex, focused it, and several times I heard its shutter fall with a snap before the trout finally succumbed and was brought to the landing-net. It was certainly a novel experience for the old rod, reared between the alder-grown banks of a fresh mountain brook away back in northern Jersey, and educated only by the splash and pull of a red-bellied, square-tailed *fontinalis*. But salt air and the brine of the sea seemed good for the little rod; the silvery fish rose prettily from beneath the foam, and the sport waxed fast and furious. Frequently, at critical moments, the camera would snap vigorously from somewhere in the rear; but after making half a dozen exposures, my friend could resist temptation no longer, and wading in waistdeep, dropped his flies upon the dancing waters. Nearly every cast meant a rise, but by no means did always mean another fish in the creel. For sea trout are tender of lip, possessing smaller mouths than their brothers of the inland ponds and brooks; a surging current rushed through the narrow channel like a mill-race; and besides, there were some big fellows lurking deep down among the eddies. They were educated fish, or perhaps had grown too old for idle play; at any rate they never frisked about upon the surface with smaller fry, but reserved all their antics until fast to a No. 6 hook. These large trout invariably struck the fly under water; but when once they did strike, it was with no uncertain intent, for they never missed. When aided by the strong rush of an incoming tide one of these heavy fish will sorely try the mettle of any four or even six-ounce rod ever made, for game and sturdy fighters they always prove. Hanging back and tugging at the line with a perseverance equal to that of the most obstinate black bass, when near the net they dive and pull and splash, darting, arrow-like, with the speed of a pike—but alas! they never jump. No sea trout that I ever caught displayed the dash and spirit, the frenzied rushes and wild, reckless leaps, of a grilse or ouananiche.

The sport continued until high water, and then ceased as suddenly as it had commenced; for with the first ebb of the tide the trout stopped their frolicking, and quietly slipped back into deeper waters of the sea. But we had enough, and our full share. Twenty-three fat fish glistened on the beach, while many smaller ones, released from the hook, again sported among the waves with their fellows—"sadder but wiser" trout.

Birds of many different species flitted through the bushes around camp or among the thick growth along the river banks. All were in full song, and displayed their brightest nuptial plumage, as it was the height of the breeding season. Not ten yards from the tent a pair of Wilson's warblers (*Wilsonia pusilla*) spent half their time feeding four noisy nestlings, and the other half scolding us for intruding upon the privacy of their home life. Ruby-crowned kinglets, chickadees and nuthatches, both white and red-breasted, roamed in bands through the spruces, while a pair of Hudsonian titmice (*Parus hudsonicus*) had just fledged a brood from an old stump near by. Fox sparrows (*Passerella iliaca*) and olive-backed thrushes (*H. ustulata swainsonii*) were nesting in the thickets, and we spent some time and not a little patience in photographing a contrary minded youngster of the former species. Of sparrows, the white-throated (*Zonotrichia albicollis*) was perhaps the most abundant, and its sweet, mournful whistle could be heard every morning and evening, or often broke the stillness of night. Robins and warblers were everywhere, and I never saw woodpeckers in greater numbers; at least five different species were observed, and a few miles up stream a pair of yellow-bellied (*Syphrapicus varius*) were seen busily engaged carrying grubs into a cavity in an old dead tree. I tapped at its base, placed my ear to the bark, and was rewarded by that sonorous chorus so well known to a lover of birds—a chorus of young woodpeckers. Almost every turn in the river sheltered a spotted sandpiper; and one little fellow, just hatched, disobeyed the warning note of his parents, betraying his presence by running swiftly over sand and pebbles. The camera shot him several times, and we finally left him, a little gray ball frozen stiff somewhere among the gravel. His protective coloration would have deceived far sharper eyes than our own, the eyes of owls and hawks and weasels; let us hope that in future it did.

Early Sunday morning came the welcome sound of raindrops pelted against the walls of the tent. It was only a shower, to be sure, but it helped; for the water was muddy, the river was rising very slowly, and by sundown flowed fully six inches higher than on the previous day. Now salmon would surely come in from the sea; they would run on to the upper pools, and we must move camp and follow them.

Trails of the Pathfinders.—XI.

Lewis and Clark (Continued).

By the end of August the explorers, having procured a number of horses, set to work to make saddles, cache their extra baggage, and set out for their journey north and west. The way led them over rough mountains, often without a trail. They were fortunate in having an old Indian as guide, but unfortunate in meeting much cold weather, and in finding the country barren of game. However, after two or three days of very difficult travel, they came upon a camp of friendly Indians, who fed them. These people professed to be an offshoot of the Tushepaw tribe, had plenty of horses, and generally were fairly well provided. They told them that down the great river was a large fall, near which lived white people, who supplied them with beads and brass wire. Not long after this they met the first Chopunnish, or Pierced-nose Indians, whom we know to-day as Nez Percés. They were friendly, and were treated as other tribes had been.

Although the explorers had had one satisfying meal, yet food was very scarce, and the Indians subsisted as best they might on the few salmon still remaining in the streams, which they shared with the white men. The privations suffered recently were making them weak; many were sick; and it was so necessary to husband their strength that Captain Clark determined to make the remaining journey by water. Canoes were built, and the thirty-eight horses were branded and turned over to three

Indians to care for until the explorers returned. Provisions for the trip were very difficult to obtain. On the morning of September 27 they started down Lewis river, without two of the Nez Percé chiefs who had promised to go with them. Indian encampments were numerous along the river, but food continued very scarce, and their only supply consisted of roots, which they got from the Indians. Later they bought some dogs from the Nez Percé for food, and were laughed at by the Indians, who did not eat dogs. The Nez Percé during summer and autumn occupied themselves in fishing for salmon and collecting roots and berries, while in winter they hunted the deer on snowshoes, and toward spring crossed the mountains to the Missouri for the purpose of trading for buffalo robes. They appeared very different from the kindly Shoshoni; they were selfish and avaricious, and expected a reward for every service, and a full price for every article they parted with.

Although it was now drawing toward mid-October, the weather continued warm. Progress down the stream was rapid, though more so in appearance than in reality, owing to the river's bends. On the bank of the stream, at a large Indian camp where they stopped October 11, a novel form of sweat-house was observed. Earth was banked up on three sides against a cut-bank at the river's edge, and the Indians, descending through the roof, which was covered with brush and earth, except for a small aperture, took down their hot stones and vessels of water, and bathed here.

A few days later one of the boats upset, and as this contained all their provisions, which got thoroughly wet and were spoiled, they were again suffering for food. Everywhere along the stream were seen fishing stations, established by the Indians, each station the property of different families, and which no one could use except members of that family. As they went on the navigation of the stream became worse, and at one place they were obliged to make a portage of three-quarters of a mile.

They were now approaching the camp of a different nation of Indians, who had been warned of the coming of the party by the two chiefs who had gone before, and now they began to receive visits from men who had come up the stream to satisfy the curiosity excited by the reports. When they reached the camp they were hospitably received, and the usual council was held, accompanied by distribution of presents and medals; and they obtained from the Indians some dogs, a few fish, and a little dried horse flesh. This was at the junction of the Lewis River and the Columbia; and the Indians, who called themselves Sokulks, seemed a mild and peaceable people, living in a state of comparative happiness. The men appeared to have but one wife, old age was respected, and the people were agreeable to deal with. Their support was largely fish, to which were added roots and the flesh of the antelope. They were chiefly canoe people, and possessed but few horses.

Here Captain Clark, while ascending the Columbia in a small canoe, first saw, besides the captured fish drying on scaffolds, "immense numbers of salmon strewn along the shore, or floating on the surface of the water." At the Indian villages that he passed he was hospitably received, and here first the sage grouse, called a "prairie cock, a bird of the pheasant kind, of about the size of a small turkey," was captured.

Proceeding down the Columbia a few days' journey, an interesting incident took place: "As Captain Clark arrived at the lower end of the rapid before any, except one of the small canoes, he sat down on a rock to wait for them, and, seeing a crane fly across the river, shot it, and it fell near him. Several Indians had been before this passing on the opposite side toward the rapids, and some who were then nearly in front of him, being either alarmed at his appearance or the report of the gun, fled to their homes. Captain Clark was afraid that these people had not yet heard that the white men were coming, and therefore, in order to allay their uneasiness before the rest of the party should arrive, he got into the small canoe with three men, rowed over toward the houses, and, while crossing, shot a duck, which fell into the water. As he approached no person was to be seen, except three men in the plains, and they, too, fled as he came near the shore. He landed in front of five houses close to each other, but no one appeared, and the doors, which were of mat, were closed. He went toward one of them with a pipe in his hand, and, pushing aside the mat, entered the lodge, where he found thirty-two persons, chiefly men and women, with a few children, all in the greatest consternation; some hanging down their heads, others crying and wringing their hands. He went up to them and shook hands with each one in the most friendly manner; but their apprehensions, which had for a moment subsided, revived on his taking out a burning-glass, as there was no roof to the house, and lighting his pipe. He then offered it to several of the men, and distributed among the women and children some small trinkets which he had with him, and gradually restored a degree of tranquility among them. Leaving this house, and directing each of his men to visit a house, he entered a second. Here he found the inmates more terrified than those in the first; but he succeeded in pacifying them, and afterward went into the other houses, where the men had been equally successful. Retiring from the houses, he seated himself on a rock, and beckoned to some of the men to come and smoke with him, but none of them ventured to join him till the canoes arrived with the two chiefs, who immediately explained our pacific intentions toward them. Soon after the interpreter's wife landed, and her presence dissipated all doubts of our being well disposed, since in this country no woman ever accompanies a war party; they therefore all came out, and seemed perfectly reconciled; nor could we, indeed, blame them for their terrors, which were perfectly natural. They told the two chiefs that they knew we were not men, for they had seen us fall from the clouds. In fact, unperceived by them, Captain Clark had shot the white crane, which they had seen fall just before he appeared to their eyes: the duck which he had killed also fell close by him, and as there were some clouds flying over at the moment, they connected the fall of the birds with his sudden appearance, and believed that he had himself actually dropped from the clouds, considering the noise of the rifle, which they had never heard before, the sound announcing so extraordinary an event. This belief was strengthened, when, on entering the room, he brought down fire from the heavens by means of his burn-

ing-glass. We soon convinced them, however, that we were merely mortals, and after one of our chiefs had explained our history and objects, we all smoked together in great harmony."

Below this, other Indian villages were passed, and there was more or less intercourse between the white men and the Indians. On the 20th an island was visited, one end of which was devoted to the burial of the dead. The passage down the river continued to be more or less interrupted by rapids and falls, about which they were obliged to make portages. All the Indians seemed to be friendly, and seemed also to be in great dread of the Snake Indians, with whom they were constantly at war.

Here is described the method of certain tribes of preparing fish, by drying, and pounding it fine, and then placing it in a basket, lined with skin of the salmon, and covering the top of the basket with skins. Fish prepared in this way would keep sound and sweet for years. It was an article of trade between these people and those further down the river, who eagerly purchased it. The preparation seems to have been the equivalent of the pemmican, made of flesh, and so extensively used on the eastern side of the Rocky Mountains.

The rapids which they constantly encountered greatly delayed them, and sometimes the contents of one or more boats were soaked by being upset, or by shipping water. Food was scarce, and they continued to purchase dogs for provisions. October 24, a change was noticed in the actions of the Indians, who seemed more suspicious than usual, and approached the travelers with more caution. This alarmed the two Indian chiefs who had come with them down the river, and they wished to leave the party and return to their own country. However, they were persuaded to remain two nights longer, since they had proved most useful in quieting the fears of the different tribes met with, and inspiring them with confidence in the white people.

A little later they met Indians, some of whom wore white men's clothing, said to have been traded with people further down the stream, and who had also a musket, a cutlass, and several brass kettles. A chief who had some white men's clothing, exhibited to the travelers, as trophies, fourteen dried forefingers, which he told them had belonged to enemies whom he had killed in fighting, to the southcast. At a burial place were deposited brass kettles and frying-pans, with holes in the bottoms. The making holes in these vessels, which were to contain liquid, was, of course, for the purpose of "killing" the vessel, that it might be useful to the spirit who was to use it in another life. Not very far below this they first met the wappato, a word now firmly established in the vernacular of the Northwest; it is the root of the plant *Sagittaria*, well known as an excellent food for human beings, and eagerly eaten by wildfowl. The Indians with whom the explorers now came in contact were troublesome mortals; very presuming, and disposed to take anything that was left about. They possessed still more articles of white men's manufacture, some having muskets and pistols. Below the mouth of the Coweliske River they found an Indian who spoke a few words of English, and he gave them the name of the principal person who traded with them—a Mr. Haley.

The river was now growing wider, there were great numbers of water fowl; and, on the afternoon of November 7, the fog suddenly cleared away, and they saw the ocean, the object of all their labors, the reward of all their anxiety. The weather was almost constantly rainy, and they were continually wet. There were numerous villages along the river, and these were to be avoided, because, like all Indian villages recently passed, they were terribly infested by fleas. Among the water fowl killed in this locality were a goose and two canvasback ducks. The sea was heavy in this mouth of the river, and the motion so great that several of the men became seasick. They landed in the bay, but the hills came down so steeply to the water's edge that there was no room for them to make a satisfactory camp, nor to secure the baggage above high water. However, they raised the baggage on poles, and spent a most uncomfortable night. For some days now they camped on the beach, wet, cold and comfortless, with nothing but dried fish to satisfy their hunger. Hunters sent out failed to bring in any game, but they bought a few fresh fish from the Indians. On the 15th of November, however, the sun came out, and they were able to dry their merchandise; and, the wind falling, they loaded their canoes, and after proceeding a short distance, found a sand beach, where they made a comfortable camp. This was in full view of the ocean, quite on the route traversed by the Indians, many of whom visited them; and there was more or less in the neighborhood, for the hunters brought in two deer, some geese and ducks, and a crane.

It was now almost winter, and the travelers began to look out for a place where they might build their winter camp. The Indians reported deer and elk reasonably abundant on the opposite side of the bay; but, on the other hand, the explorers wished to be near the ocean, that they might provide themselves with salt, and also for the chance of meeting some of the trading vessels, which were expected in the course of the next two or three months. The rain continued, and the hunters were unsuccessful. A diet of dried fish was making the men ill, and the prospects were not bright. However, on the 2d of December, one of the hunters killed an elk, the first taken on the west side of the Rocky Mountains; and we may imagine how much its flesh was enjoyed after the long diet of roots and fish. And now for some time deer and elk were killed in great abundance; but the continued wet weather caused much of the flesh to spoil. The Indians seemed to be taking a good many salmon—presumably in the salt water of the bay—and they had many berries.

The natives here were chiefly Clatsops, most of whom were kindly and cordial, reasonably hospitable and generous; but, at the same time, careful bargainers, and determined to get the worth of the goods which they desired to trade. The explorers found that blue beads were the most valuable trade articles, and that the Indians cared little for those of any other color,

except white; but even these were not highly valued in comparison with the blue beads.

Christmas and New Years passed, and in the first days of January there came the news that a whale had been cast up on the beach. All the Indians hurried to it; and, following them, went Captain Clark and some of the men, and with them Chabonneau and his wife, the latter extremely anxious to venture to the edge of the salt water, and to see the enormous "fish" which had come ashore. The skeleton of the whale measured 105 feet in length.

"While smoking with the Indians, Captain Clark was startled about 10 o'clock by a loud, shrill cry from the opposite village, on hearing which all the natives immediately started up to cross the creek, and the guide informed him that some one had been killed. On examination, one of our men was discovered to be absent, and a guard was despatched, who met him crossing the creek in great haste. An Indian belonging to another band, and who happened to be with the Killamucks that evening, had treated him with much kindness, and walked arm in arm with him to a tent, where our man found a Chinook squaw who was an old acquaintance. From the conversation and manner of the stranger, this woman discovered that his object was to murder the white man for the sake of the few articles on his person; and when he rose and pressed our man to go to another tent, where they would find something better to eat, she held McNeal by the blanket. Not knowing her object, he freed himself from her, and was going on with his pretended friend, when she ran out and gave a shriek which brought the men of the village over, and the stranger ran off before McNeal knew what had occasioned the alarm."

With a small load of blubber and oil, the party returned to the fort, where they found that game was still being killed, and endeavored to jerk some of it. Much is said in the journal about the various Indian tribes of the neighborhood, their method of hunting and fishing, their habitations, and their dress and implements. The canoes, and the skill in managing them, excited the unfeigned admiration of the white men; and the fact that such canoes could be constructed by people without axes, and armed only with a chisel, made of an old file, about an inch or an inch and a half in width, seemed to them very extraordinary. It was noted that some of the Indians, especially the women, appeared to tattoo the legs and arms; and on the arm of one woman was read the name, J. Bowman; perhaps some trader who had visited the locality. Among these people women were very well treated, and old age was highly respected.

GEO. BIRD GRINNELL.

Swimming and Life-Saving.

It has always struck me as curious that though Englishmen are so fond of all athletic sports—though yachting, boating, and fishing take so prominent a place among our sports and amusements—yet that we are such very bad swimmers. When at Cambridge I could never find anyone who would swim the half mile with me, and I doubt if there were twenty men at the University who could have swum half a mile. "Rather not, I get so pumped!" was the answer always made to my invitation. Yet there is no exercise which, when properly learnt, "pumps" one less or tires one less. After a five-mile race one's heart is not beating any faster than at the start, nor is one half so exhausted as after riding a bicycle up a steep hill.

I often talked with Captain Webb about his Channel swim, and he told me that even after swimming for twenty-two hours his muscles were not very tired, and that it was weariness he felt more than exhaustion. We used to swim for two hours together twice a week when we were both training for some race. He was a slow swimmer, but swam in excellent style, which means he wasted none of his strength, and when I knew him he never swam anything but the breast stroke. If I remember rightly he never was any good at any of the side strokes, and he certainly swam the Channel on his breast. The Channel may be crossed again, but it is not very likely, as several good swimmers have tried and been beaten. Except for the pleasure of having to look out the Hellespont in the map, Byron's swim (which is, I suppose, more or less an historical event, as it is alluded to by every distributor of swimming prizes who wishes to show his learning) should be forgotten, and never alluded to as a feat at all when compared with Webb's.

Men are "pumped" because so few care to learn to swim properly, and are content to flounder and splutter about, thinking, apparently, that the faster they move their arms and legs, never mind in what direction, the more magnificent their swimming.

Swimming is a question of balance, and that is why when once learnt it is never forgotten. The mistake in learning is that to avoid breathing in water boys put their heads too far back, and so keep their mouths too far above the surface. Nobody will ever swim well or with any ease till he has learnt that it is not necessary to carry his neck like a strangled giraffe. This strained attitude upsets the balance. You will see every good swimmer in the world swimming with his mouth under water till the arms separate, his body will thus be straight, very high in the water, and he will be balanced properly.

To learn to breathe properly means to learn to swim quickly and well. It is very simple; all that the tyro need remember is to breathe outward as his hands go forward, and to breathe inward directly his hands separate, which is the moment when his head is highest. I have found it useful, when teaching, to tell boys to "blow their hands from them" as a sort of *memoria technica* of the moment to breathe outward. I am sorry for lads whom I see learning to swim when they become apparently much distressed about the proper movement of their legs and arms, and much more sorely distressed really by the amount of bath water they are swallowing, of which the instructor takes no note, though the pupil does.

One word more about learning. It is important—very—that the hands in breast-stroke swimming should work in the same horizontal plane as the body, and not downward; working them downward is a waste of strength;

they are then only lifting the body out of, instead of propelling it through, the water. It is important that boys should be taught the breast stroke properly. All boys think they can swim quicker on their sides, because when on their sides they see the water pass by their faces, and fancy that they are going as fast as a torpedo catcher. But it is a mistake. The proper side stroke now adopted by all amateurs and professionals for racing is very different from what boys call "side stroke," and ought to be carefully learnt after a good breast stroke has been mastered. Nothing but a good breast stroke can save you in trouble, nor can you save a drowning man by any fancy swimming.

Now for the second part of my text. Can there be a more hideous danger than that of swimming up to rescue a drowning and struggling man, who, fighting for his life and in the agony of suffocation, will seize you and clutch you and take you with him to the bottom? Drowning men are said to clutch at a straw, but for choice they prefer something more substantial. Summer after summer we read the same old story of the rescuer being clutched and drowned and two lives lost, one of

LOOSENING THE HOLD OF A GRAPPLER.

them certainly being that of a brave man. Yet it is a mere question of three or four hours' teaching and practice to enable anyone to rescue a drowning man with but very little danger to the rescuer.

It has been my painful duty to award the medals at the so-called life-saving competitions now taking place every summer at our public schools. Miserable and gloomy farces they are. A stuffed booby is pushed out about twenty yards into the water, and the boys jump in one after another and pull it to shore. The booby is then sunk, and the boys have to dive and bring it up, no directions being given how properly to do so. Anything more unlike what one has to do when confronted with the danger of rescuing a struggling man it is impossible to conceive, and I hope the day is not far distant when public school boys will be ashamed to accept a medal for such a silly competition.

When you swim up to a drowning man he will prob-

HELPING AN EXHAUSTED SWIMMER.

ably seize you by the wrists. If you turn your wrist round against his thumbs he cannot hold you for a second, and the fact of his losing his hold on you will probably swing him round, so that you can then catch hold of him properly and bring him to shore, swimming on your back.

My readers should be a little careful how they practice this, because if they try to hold on when the wrists are turned against their thumbs, the result may probably be dislocation.

It is not safe, however, to assume that the rescued man will remain quiet, nor will he, if any water splashes on his face; so the best way to hold him is to place your arms under his, and your hands on his chest. He cannot then turn round on you, and his head is higher out of water than when simply held by the head. If he seizes you by the head, which is the next most likely part to be grasped, you must put one arm behind his back, one hand under his chin, the arm behind pulls him toward you, the hand under the chin pushes his head backward and under water. He will let go of necessity. If he seizes you lower down you must put your knee up as high as it will go, and you can easily free yourself. All this is far easier to do than it is to describe, if only men will take the little trouble to learn.

If the drowning man has sunk, you will generally see by the bubbles in still water whereabouts he is. Dive

down, and be it noted that the common idea that you cannot open your eyes under water but must go down with them open is utter nonsense. Get the body across one knee, and a kick from the other leg will bring you and him to the surface. A man will not clutch or struggle if he has once sunk, but that is no reason for letting him sink. A man who has sunk is very nearly dead. Be it noted also that it is utter nonsense to say that a man "rises three times," and it is difficult to know how such a very common belief can be so widespread. If you determine to wait till your sunken man rises again you will have to wait till the Resurrection Day.

So far I have referred only to rescuing a struggling man fighting for his life and lost to all sense but his own danger; but it may happen to many of us to be swimming with a friend who gets cramp, or to soldiers to have to get a wounded comrade across a river. The ordinary mortal would try to swim with the injured man on his back, and would assuredly fail. But nothing can possibly be easier than to help another man who will keep quiet and has his wits about him. If he will turn on his back and place his hands on your shoulders, you can swim any distance with him without being in the least incommoded. I am sure no one will believe how easy this is till they have tried it.

No one can say he will never find himself in the dreadful position of seeing a fellow man drowning before his eyes. At the expense of a few hours given to learning how to save life and keep his own the position would not be so dreadful. Surely this is worth the expenditure of a little time and a very little trouble, and surely this knowledge might with advantage be given to our boys at our public and private schools. —Hon. Sydney Holland in *Badminton Magazine*.

Natural History.

The Naturalist of the St. Croix.

WHEN George A. Boardman passed away, some three and a half years ago, the Maine woods lost their chief interpreter, and the New Brunswick forests a familiar presence. Like Thoreau, this eminent naturalist knew all their haunts and by-ways; and for seventy years he studiously cultivated the acquaintance of their furred and feathered denizens until he came to know them all by sight and name, and gathered one of the largest private collections in ornithology and natural history of any citizen of this country. It has been well said that "the accuracy of his scientific knowledge was only exceeded by his noble character and beautiful life." No wonder that his appreciative friends and family did not rest until they had produced a fitting memorial of the good man and his valuable work. This has recently been brought out in the shape of an exquisite souvenir volume, edited by his nephew, Samuel Lane Boardman, of the University of Maine, and gratuitously distributed at the expense of the Boardman family to several hundred grateful beneficiaries, of whom the greater number are naturalists, or persons interested in natural history. A special edition of twenty-five copies, exquisitely bound in kid, and quaintly illustrated, was the personal gift of his second son, Albert J. Boardman, of the Gas Improvement Company, of Philadelphia. The memorial was exclusively a home product, intellectually and mechanically, and as a most creditable sample of the book maker's art, shows what can be done in Maine.

When our native-born school children are asked the question, "Who is the greatest general that ever lived?" they will invariably answer, "George Washington," because the name occurs to them first. For a like reason, Audubon has the first place among naturalists, and his

name will probably stand long after others more prominent are forgotten. But there are others of equal repute who are illustrious, and of these Mr. Boardman is perhaps foremost. His collections bear witness to his merits, and they are on view in the Parliament House in Fredericton, N. B., Canada. Few will have the temerity to dispute his precedence. The very extensive correspondence included in the St. Croix Memoirs not only lets the reader into his inner life and the systematic methods of his work, but it discloses his painstaking accuracy, indicates the advanced progress of his study, and introduces his co-workers and compeers by name, in England and America, showing their estimate of him by what they expect, say, and ask of him. Celebrity depends much upon the period, the place, and the occasion. Shooting stars excite a momentary admiration and wonder, but the glory of the planets is fixed.

It must not be inferred that Mr. Boardman's specimens represented the fauna of the St. Croix region alone. Mr. Boardman ranged far and wide—to Florida, South America, and the West Indies—year after year for decades, until he was able finally to present the almost representative fauna of eastern North America, with each species of bird in the variant plumage of sex and seasonal migration. And in the literature of ornithology and general natural history, his pen was his ready adjutant and constant co-efficient. His unpublished notes and essays would make a volume additional to what appears in the St. Croix souvenir, and all reliable. Prof. Spencer F. Baird, so long Chief of the Smithsonian Institution, declared that Boardman's contributions to the Institution were the only ones which needed no correction. Pioneer observer that he was, Mr. Boardman made his studies and recorded his observations upon birds of eastern North America before the present school of ornithologists had begun their work. He was the first to discover a number of species, and found the first nest and recorded the first nesting habits of many birds then little known to science. The author of the Memoirs has happily traced the progress of his discoveries with almost chronological exactness from the date of his maiden field work to his demise; and, it may be added, has given more accurate scientific lists of all the specimens in the collection, not only of the St. Croix region, but of Florida, where he spent no less than twenty winters. He was a persistent student of albinism and melanism, and had the largest collection of bird freaks in the country, covering no less than twenty-five different species of raptorial, game, and song birds.

In its issue of August 5, 1901, the *FOREST AND STREAM* published an extended sketch of Mr. Boardman, which it is easier to refer to than repeat here. Some things can be said here, however, which would hardly have answered then, while he was living. Suffice it to say that he was a naturalist of the old school, and employed the methods of the old field naturalists. He always shot his own birds, and was allowed to be one of the best wing shots in the country. His knowledge came by personal contact and association, while roughing it in the bush. He learned directly from Nature's self, and accepted the lessons thus acquired. He did not elaborate theories, and dawdle with auto-suggestions and new thought philosophies. He worked with his hands in Nature's workshop, and not, as the tendency of the present time is, to give up dealing directly with things, and take to thinking alone as the only dignified and respectable employment for professional men.

CHARLES HALLOCK.

Chatham, N. J., has an abino robin, which has appeared for the second setson. The bird resembles the ordinary robin in size and form, but instead of the red breast it has a broad dash of white, while its wings and head are covered with feathers flecked with the same color in abundance.

A Cunning Scarecrow.

If the crow has a sense of humor (and despite his sable coat and solemn bearing, I am inclined to think he has), he must often laugh heartily at the figures which are erected with the object of scaring him. They are certainly ridiculous, and no crow with an ounce of sense or experience could mistake them for live men.

The mode of erection is generally this: A stake is set in the ground and a cross-piece nailed to it. On this is hung an old coat and possibly an attempt is made to clothe the nether extremity with a pair of trousers. Above is placed a battered hat, and there you are.

Now, this might have deceived a crow when the world was young, but it deceives him no longer. He is "on to it," he treats it with contempt; he laughs at it. I have heard him conferring with some of his fellows on a tree apropos of such a figure, and if ever a bird laughed it was he. "Haw! haw! haw!" shortly and derisively. There was really no mistaking it. Then he sailed down into the cornfield and began to pull up the grain under the very nose—beg pardon!—in the very shadow of the "sentinel."

It seems the farmers must think the crow has no powers of observation or deduction. But no, unfortunate men, they have only too much reason to think otherwise. The fact is, I believe, that they are deficient in art. They use their best efforts to represent a live man, but so unsuccessful are they that even a bird of the air is not deceived. However, they should not feel bad over this. If they lived in the city, they would know that many a more ambitious artist has essayed the feat with not much more success. But the feat is not impossible. If I did not find this out in the art galleries (at least those devoted to the exhibition of contemporaneous efforts), I found it out in a cornfield. Actually so; and glad am I to be able to bring tidings of joy to the farmers—the poor, long-suffering men. (I wish I could only raise all their mortgages and make the weather for them.)

A few weeks ago I was in the country, and strolling along a road I came upon a cornfield newly planted. I stopped to admire the tender green shoots just appearing above ground, when something in the middle of the field attracted my attention. "It cannot be a scarecrow," I commented; "it is a real man watching for a shot." The figure was semi-recumbent (like that of a man on a still-hunt), with no coat on and the shirt sleeves showing distinctly, while a gun was held in readiness to be raised to the shoulder. I gazed at the figure for some time, immovable there in the middle of the field, and I thought to myself, "What patience the man has. I guess he must be a fisherman, too." Then, as I continued to gaze, and there was still no movement, I began to grow suspicious; so, to satisfy my curiosity, I vaulted over the fence and started across the field.

When within twenty yards of the figure, I could not yet make up my mind whether it was alive or not. There was certainly no movement, but if the figure was alive the immobility might be explained by the intentness of watching. And as the back was turned toward me, and my footfall was noiseless in the soft clay, my approach, of course, had not been detected.

At length I came up with it and stopped short, struck to admiration. The figure was inanimate, and yet might have been said to breathe. I took off my hat to that work of art. The crows were flying about, or thieving, in neighboring fields, but never a crow came near that field. Again and again I contemplated the figure, with ever-growing admiration. "Such a brilliant conception," I soliloquized; "such vraisemblance—such a natural, suggestive pose; and the shirt sleeves—the last touch of genius!" Had I known where the artist lived, I should have gone there and then and paid him my sincere homage.

FRANK MOONAN.

Life in the Woods.—XII.

From Great to Small.

A HUNTER is usually a man of many resources, especially when in the woods, and this rule seemed to hold good in our party. So it came about that while in camp, and not engaged in the routine work of sawing wood and putting it under cover, or washing dishes, cooking, and carrying water, or mending clothes, cleaning guns, reloading ammunition, or writing letters, reading, or playing cards, someone was devising some other form of occupation. Bill and the Colonel, who were explorers in their way, had, in the course of their travels, discovered a wild cranberry marsh, and one day, after dinner, the entire crew went over to it. We found a big crop of berries, and in the course of a half hour or so had picked enough to last us nearly two weeks, so that throughout the remaining time of our hunt we did not lack for cranberry sauce. It was good, too. The wild berry is much smaller and of darker color than the cultivated product, but it has a much more tart, and in some respects a much better flavor than its civilized sister. They take quantities of sugar to make them palatable, but we had a large supply,

and enjoyed the wild berries to the fullest extent. We found, also, that the lakes around us were well stocked with fish. For one lake we constructed a scow from some boards we had brought in with us from the railroad station. On another there was an old boat which, though rather leaky, was made of some service, and for all the other lakes we built rafts. For the latter we cut light logs—cedar, when it was possible to obtain it—and these we fastened together by boring inch auger holes into them and fastening cross-pieces with wooden pins. The auger we took in with us for that express purpose, and an ax and a few wire nails were all that we needed in addition. At a deserted logging camp we found quite a quantity of wire which had come around the baled hay used for the horses, and this was also made use of for binding the logs together. Our boat was a simple affair, but so serviceable that we christened it the Dandy. Two side boards rounded off at both ends, two end pieces, and wide flooring laid crosswise, constituted the craft. To prevent leaking we made pitch from rosin and tallow, and poured it liberally all along the inside cracks. In this way we made a boat as staunch as could be desired, and one that did duty for a number of seasons. Our fishing tackle was primitive, for it consisted of poles cut from a neighboring thicket, a piece of strong line, and a hook

and sinker. Our plan was to catch our fish more by main force than to enjoy the delights of landing a big fish with light tackle. Most of the lake abounded with what in the West are called pickerel, and in the East pike, and at first most any kind of bait sufficed to tempt them. A piece of salt pork or venison or red squirrel would generally land a good string in a short time, and now and then, by standing on a raft and throwing a spoon far out in the lake, good sport could be had. The fish were not large, it being rare that we caught one over five pounds, but they seemed to be as fine for the table as any fish that swims. The meat was hard and juicy, and of a pink color like that of the salmon, a peculiarity I have never noticed in the same kind of fish caught in any other waters. In another small lake near camp there were nothing but perch, and with these the waters of the little body seemed to fairly swarm. Many a good fry we had of them, for, barring the bones, they seemed about as delicate to the palate as their larger brethren. We also made use of them for bait when the more aristocratic fish became tired of salt pork and venison. By the use of a large tin pail we could preserve the smaller fry alive, and by transporting them to some of the other lakes could keep them alive, in a hole dug along the shore, for a considerable length of time. When the lakes froze over

they were of especial benefit, for then we caught all of our fish by means of set lines, and for this live bait was found to be the very best. In the northern woods, in November, the cold weather is liable to come very suddenly, and the warm, sunny day may be succeeded in twenty-four hours by blasts almost as cold as those that come in midwinter, and which lock the lakes in their stony embrace without much ado. When such a time came, and the ice was strong, we would cut five or six holes, and, taking about twenty feet of line for each, we would attach a strong hook and a small perch, and lowering it about eight feet in the water, leave the remainder of the line looped up to a stick placed across the hole, and so arranged that the slack line would run out when pulled slightly, thus allowing the fish to take the bait and run a little way with it before feeling the strain of the line or the prick of the hook. We were very successful in this way, and usually had at least two or three fish on our lines, which were sufficient for our needs for two or three days. Some anglers will, of course, condemn this method, but there was sport in pulling the big fellows up through the ice, and so long as we caught no more than we needed to eat, criticism is not of much avail. Along the small streams, in which the country abounded, we found still more sport, for there was the home of the speckled trout. Though out of the season, we must plead guilty, and admit that now and then some disciple of that rare old Englishman would steal up and along the headwaters and occasionally provide us with as toothsome morsels as are ever served by the chef of the most famous restaurants. With venison, fish, and wild cranberries, together with potatoes, onions, pork and beans, bacon, tea, coffee, and the delicacies brought from home, we were able to set a pretty good table. But we had more than these; for, like some of the squatters, we lived a good deal on the resources of the country. In the thickets close to camp and along the creek bottoms were an abundance of partridges and rabbits, and it was very seldom that we did not have a supply of them hanging to the trees that stood by our camp. Generally they were bagged at the close of a day's hunt, when the tramp was almost finished. When near camp some of the experts were wont to elip the head from a rabbit or partridge when a good shot could be had, but those of us who were less proficient, preferred to use other means. Occasionally in the afternoon we would turn out for a rabbit hunt, during which we usually managed to have considerable sport. The rabbits were the large species half way between the little cottontail and the jack, and in the winter they turn pure white. Before a hound they will lead off well, and at times make almost as long turns as a fox, but when chased by a dog that will not follow very close or very long, or when jumped up from under a log by a person, they will only run a short distance. One day I know in a very short time we secured nine. The partridges were equally as easy prey, as oftentimes they ran along the ground, stopping every now and then or fluttered to an adjacent log and sat perfectly motionless. Some times with rapid flight they shot to the top of a tall tree. In such cases, unless their line of flight has been accurately marked, they are hard to locate, and when high up it takes a keen eye and steady nerves to bag them with a rifle. However, we always found them quite plenty, and in such condition that they made a delicate dish for the table.

This year we spent Thanksgiving in camp, and from the resources of the country we had venison, rabbit, partridge, fish, and wild cranberries—a bill of fare good enough for an emperor. Another form of amusement that was afforded us was trapping, and in this the Old Trapper was in his proper element; here he excelled; here he was undisputed authority. Here he could give us all pointers, and then have a goodly supply of lore left. Trapping is a fine art. It has a language of its own, and the one who follows it will, on the creek banks, shores of the lakes, and anywhere along the water, read things that to the average mortal are nothing to be noticed. The beaver, the otter, the martin, the mink, and the muskrat, have all abounded in this region, though the first two are now about extinct. Occasionally a few can be found in some isolated spot. At one time, near our camp, some beaver had a dam, but they were wary, and it was seldom that we caught a glimpse of any of them. They did most of their work at night, but on our approach—no matter how carefully it might be made—we would hear their quick alarm, and know that they had gone below. They seemed always to keep some one of the family on guard, and at the least suspicion of danger the sentinel makes a loud noise by slapping the water quickly with his broad tail, making a sound similar to that produced by striking the water with the side of a paddle. This is repeated several times, and answered from several different quarters; then all is silent. Late in the hunt they had their dam in nice shape. They had fallen some trees with the skill of the most expert woodsmen, some of them more than ten inches through, and they had fallen them, too, exactly where they were needed. They had fortified the dam, with stakes and brush, and had plastered it with mud until they succeeded in raising the water in the lake several feet. They had also cut large quantities of green wood, and sunk it in the water for their winter supply of food. It was at this point that the crafty Old Trapper commenced his operations. One afternoon he broke a small hole in the top of the dam and set a trap there, just under the water, and the next morning he had a monster of a beaver in it. After two or three days he repeated the operation and caught a smaller one. Then what was left of the family migrated to an adjacent lake, and there commenced their work anew, and this time unmolested, so far as we were concerned. One night, while watching a runaway up river, I thought I saw a sea serpent coming and disappearing in sections. My first inclination was to run back into the woods, and then my next thought was of my rifle and its nine shots, and I kept still. When the object neared me, I saw that the commotion was caused by two large black animals swimming, one right behind the other, and they kept diving under the water every few feet, only to reappear in a moment or two. I took aim and, when they were opposite to me, let go. One jumped out of the water to the opposite bank, and the other went under, and I saw neither again. I did not know what they were. At night, when I told of the occurrence, I found they were otter. The next day the Old Trapper

commenced operations on the river, and in a week's time he caught two magnificent specimens. He claimed they were the two I shot at, but I always thought I killed one of mine, but if I did we were never able to find it. The two he caught were black, glossy, and beautiful in appearance. When he came up to the trap, one of them was not dead, and it growled and spit at us like a monstrous cat. It showed great strength, and nearly escaped before we killed it. These, with twelve nice mink and some rats, completed the Old Trapper's string.

We punished a part of the day after our cranberry picking expedition, by shooting at a mark. We tried every firearm we had in camp, from a little skeleton-stock rifle up to two shotguns, which were used with buckshot by some of the party. Finally we came down to shooting squibs. This form of ammunition is excellent for some purposes. It is inexpensive and easily prepared. One man can reap a large number of shells in a short time, and he can cast in two hours or buy for a small sum enough round bullets to last for several hunts. The bullets, of course, must be of the same caliber as the rifle in which they are to be used. After the shell is capped, put in from 5 to 10 grains of powder, and if the shell is not bottle-necked, ram the ball in, and that is all that is necessary. If the shell is bottle-necked, put a little tallow on the ball after it is down, and that will hold it in place. These squibs make no noise to speak of, and yet they are very effective for short ranges. After exhausting the target business, we all went out to watch, but were unsuccessful, except that we all succeeded in working up a good appetite for supper. Before we retired that night, we were talking about watching for deer at evening, when the Colonel related the following:

"Late one afternoon the members of our party had gone out to watch on favorite grounds, while I remained in camp to more completely put in order some camp arrangements. This being completed sooner than I anticipated, and as the sun shone bright and warm for an October evening, the spirit seized me to take my rifle and quietly wend my way to what we called the valley trail, which I had discovered during the early part of the hunt, and there take a stand and watch for game. Seated on an old fallen tree, my attention was soon taken up with the antics of two red squirrels that were gamboling around the trees and in the leaves that surrounded me. I was thus occupied for some time, when suddenly it occurred to me that the deer trail was my main object. Looking up quickly, and along the direction the trail ran, I saw walking toward me a regular monarch of the forest, one with great antlers. The first move of my rifle brought him to a standstill, with head erect and eyes glistening in the evening's sun. It was but the work of a few seconds before a rifle ball went crashing through his shoulders, and there lay my first deer for that season, and a monster he certainly was. After bleeding and dressing him, I returned to camp, and in the joy of my success took the big dinner horn and blew such blasts that the entire party came hurrying in, expecting some bad news from the outside, but as my story was told them, up went a shout for my success."

Then we slept.

CAROLUS.

Massachusetts Fish and Game.

BOSTON, June 24.—*Editor Forest and Stream:* I inclose copy of the "Right of Search" law passed at the recent session of the Massachusetts Legislature. This measure was the one thing which the central committee urged upon members the past winter, and was included among the various recommendations of our commissioners in their report for 1902.

It is believed that it will aid the deputies in securing warrants in cases where search for game or fish is imperative. Although the bill as passed is not as drastic as that recommended by the commissioners, it embodies all that could be secured this year, and received the indorsement of the Committee on Fish and Game. The text follows:

Section 1. Any commissioner on fisheries and game, deputy commissioner on fisheries and game, member of the district police, or officer qualified to serve criminal process, may, with a warrant, search any boat, car, box, locker, crate or package, and any building, where he has reason to believe any game or fish taken or held in violation of law is to be found, and may seize any game or fish so taken or held, and any game or fish so taken or held shall be forfeited; provided, however, that this section shall not authorize entering a dwelling house, or apply to game or fish which is passing through this Commonwealth under authority of the laws of the United States.

Section 2. A court or justice authorized to issue warrants in criminal cases shall, upon complaint under oath that the complainant believes that any game or fish unlawfully taken or held is concealed in a particular place, other than a dwelling house, if satisfied that there is reasonable cause for such belief, issue a warrant to search therefor. The search warrant shall designate and describe the place to be searched and the articles for which search is to be made, and shall be directed to any officer named in Section 1 of this act, commanding him to search the place where the game or fish for which he is required to search is believed to be concealed, and to seize such game or fish.

That committee, to the regret of all who desired further protection of the lobster industry, turned down the recommendations of the Commission for the passage of a "lobster meat" bill similar to that of Maine, prohibiting the sale of the meat without the shell, and the bill requiring that lobster fishermen be required to secure from the board a permit allowing them to engage in the lobster fishing business, which could be revoked at any time in case they were caught violating any law for the protection of lobsters.

These moderate and salutary measures were defeated by the efforts of the fishermen, who do not seem to have the faculty of looking beyond the present.

When Captain Collins was asked before the committee why he had not recommended a close time, he replied that he was desirous of trying other measures before inflicting such hardship on the men dependent on lobster catching for a living.

The bills above referred to were unanimously recommended by the convention of commissioners held in Boston last summer, an account of which meeting appeared in the columns of *FOREST AND STREAM* at that time. So long as lobsters continue to become more and more scarce, and prices constantly mount higher and higher, the question of their preservation will remain one of universal public interest, and, like Banquo's ghost, "it will not down."

The work of the United States Commission in propa-

gating has accomplished something, but for all that, the problem of saving the crustaceans must as yet be recorded as unsolved.

The rigors of the past winter, while entailing great losses to bird life, have wrought some good in awakening an interest in providing food for our feathered friends. It has also stimulated hosts of sportsmen to make laudable efforts to replenish the covers of our State by restocking. As a result, several new clubs have already been organized which are destined to prove valuable auxiliaries in carrying forward the work in which our Commission are earnestly engaged. Your readers have been informed of the formation of the Middleboro Club, which had its origin in the efforts of sportsmen to save the quail of that region from starvation. Another new organization has been formed in Rockland, and last month a preliminary meeting of about thirty gentlemen was held in Reading, at which a committee was appointed to prepare a constitution and by-laws for a club of the sportsmen of Eastern Middlesex, embracing some half a dozen towns in the vicinity of Reading, including Wakefield, Stoneham, Lynnfield, etc.

In all probability some of our deer have perished during the winter, as well as our birds, for the reason that, owing to the deep snows, many have fallen a prey to dogs. The commissioners have received reports of a dozen or more veritable cases in which deer have been injured or killed by them. That dogs, unrestrained, are very destructive to deer requires no proof beyond ordinary observation, and the remedy rests mainly with their owners.

The commissioners have completed the work of distributing about 1,000,000 trout fry this spring, the number of applications for them and for fingerlings to be put out the coming fall being in excess of 360. It is expected that there will be not less than 90,000 fingerling trout when the time arrives for their distribution.

An increase of more than 25 per cent. in the output of pheasants and hares over that of last year is expected. Reports from several towns in the western counties show the good results of stocking the streams in years past, which are gratifying to the commissioners as well as the sportsmen.

Very good creels have been taken by the trout fishermen of Springfield, Pittsfield, and other cities and towns in the central and western sections of the State.

Some of your readers may not have heard of the beautiful gift recently received by Chairman Collins from the Department of Agriculture and Commerce of Japan. This consists of two very elegant Cloisonne vases, accompanied by a highly complimentary letter from the Japanese Minister at Washington, K. Takahira, in acknowledgment of his "courtesy in transmitting various reports, and for the assistance rendered in the education of Japanese students in matters relating to high sea fisheries."

CENTRAL.

Mr. Hallock Finds Game Plenty in Western Massachusetts.

PLAINFIELD, Mass., June 20.—I note this year a rejuvenescence of the beech trees in this section of Massachusetts where I am summering. For twenty years past there have been very few beech nuts, almost none, in this locality, although the trees are healthy and numerous, quantities of them standing in groves, samples of which measure from twelve inches to three feet in diameter. But now both old and young trees are well fruited. I send samples of burs herewith, which hold out a tempting promise to the partridges (ruffed grouse), deer, and squirrels. Sagacious persons who love hunting are banking heavily on an increase of game in these parts, especially for the coming year, and the signs are certainly encouraging. During the past week I have been doing considerable bush beating, keeping out several hours at a time, and ranging wide, and have flushed several broods of ruffed grouse able to fly a rod, besides crossing many deer paths much tracked up, and finding places where they have bedded in the ferns at the edge of the woods. Knowledge of the habits of these creatures enables one to find them without a dog, but they are in different places at different times of the day, and in varying weather. There ought to be good deer shooting in northwestern Massachusetts when the close time period expires. The annual report of the Fish and Game Commissioners for the current year publishes reports from forty localities in different parts of the State which speak of the rapid increase of deer. In many places they are becoming a nuisance. Drove of three to ten are seen together. One correspondent says he has seen as many as forty within the year.

CHARLES HALLOCK.

Adirondack Deer and Elk.

BLUE MOUNTAIN LAKE, N. Y., June 21.—*Editor Forest and Stream:* Deer signs are about as numerous as usual. The talk about the deer starving in great numbers last winter is certainly not true in this section. To-day I had a talk with our courteous and efficient game protector for Hamilton county, Mr. Robt. O. Nichols, of Indian Lake, and he told me that he traveled his territory last winter on snowshoes a great deal, and later, when the snow crust would bear up the deer, he traveled on that. He saw but very few dead deer—five to seven being the largest number in a long distance—while in one day he saw 138 live deer. His judgment is that game wintered well as a rule. However, he said he could not speak from personal knowledge of the Moose River region, nor of the country around Long Lake west. From both these sections come reports of many deer dead from starvation. If this be true, it merely indicates a great abundance of deer in those parts.

The elk seem to be thriving hereabouts. Recently a band of seven were seen in a cow pasture feeding among the cattle. Some of the residents here have a mistaken notion that the elk are driving out the deer. This cannot be, for the elk are too newly introduced, and are as yet too few in numbers to drive out the deer, either by fighting or by consuming their food. But another cause has undoubtedly operated against the deer. This place is practically surrounded by lumber camps, most of which are now in operation their third season. Leaving out of account whatever deer are eaten in these camps, the tendency is for the deer to retire to less disturbed por-

tions of the forest, while the elk, introduced from semi-domesticated herds on private preserves, are less shy of man. This, I think, explains for this section the less than usual observance of deer where that condition exists.

Present indications are that the season will be lighter than usual for the hotels, but the region maintains its unsurpassed loveliness. JUVENAL.

All communications intended for FOREST AND STREAM should always be addressed to the Forest and Stream Publishing Co., New York, and not to any individual connected with the paper.

New Jersey Imported Deer.

EGG HARBOR CITY, N. J., June 17.—The commissioners sent me seven deer, four Virginia and three English fallow. Two of the Virginia deer died soon after being liberated; they had been hurt while being caught. One buck of the English fallows was killed by a train on Easter Sunday night. This leaves only three. They were put six miles from here in the wilderness, but since about a month came right into the heart of this little city. They come right under the electric lights and enjoy the vege-

tables in the gardens. The buck is the most daring; the does do not venture in so far. Yesterday I had some reports that two young deer were seen with a doe; another man only saw the tracks of the young alongside of the old one.

The plan of the Board of Commissioners is to get these deer to mix with our native deer, which are quite numerous about seven miles from here, near Weymouth. We all hope that they will increase, and will stay off the railroad tracks.

JOHN SCHUSTER, JR.,
Warden for Atlantic County.

SEA AND RIVER FISHING

Fish Chat.

Is Salmon Culture a Failure?

AMONG the good things with which FOREST AND STREAM for June 11 was filled to overflowing, was one in which I was particularly interested, namely the article written by The Old Angler; so interested, in fact, that it has had its third reading, and I shall keep it by me for future reference.

While I agree with him fully in some of the points he has taken, and believe that unless sharp curtailment of privileges now enjoyed by netters, weir men, *et id omne genus*, is quickly brought about, the extirpation of the salmon in many of our rivers will as surely come as the night follows the day. I do not believe that his views in relation to the non-adviseability of the artificial propagation of fish are unqualifiedly correct, for I have watched its results in too many streams to be willing to relinquish the conviction that the method and practice are among the greatest achievements of the nineteenth century.

The stocking of streams artificially has, in great measure, brought back to them the noble fish which, by the shortsightedness and greed of man, had been practically exterminated in them, and that the salmon are not now abundant is not owing to the badness or worthlessness of the method of artificial propagation, but rather to the continuation of that reckless greed which had formerly depleted the streams. Now, I would have no controversy whatever with The Old Angler; I read everything he writes that is printed in FOREST AND STREAM with pleasure and profit, but my observations for a great many years have led me to believe that the artificial restocking of our rivers is not only feasible, but absolutely necessary.

Visible Results

Among our important Eastern rivers that have been restocked, I will occupy space to name but a half dozen, for they will suffice for my present needs. In the Merrimack River the Fish Commissioners of Massachusetts and New Hampshire have in years past liberated a considerable number of fry, which grew and flourished, descended to the sea and returned again, and are now living in the river, not in abundant numbers, it is true, but they are sufficiently plentiful to show that the planting has been a success. Before the fry were put out the salmon was, I believe, totally exterminated from that beautiful river.

In the Penobscot River in Maine almost exactly the same conditions obtain; salmon, which had year by year grown more and more scarce, have now become moderately plentiful, and the large fish which are now taken in the river, were no doubt originally among the fry that were in former years liberated by the commissioners.

In Port Medway River, in Nova Scotia, the story is the same. In Middle River, half way between Baddeck and Margaree in Cape Breton, in which stream twenty-five years ago not a salmon existed, is now so well stocked that the angler may, almost any day, get two or three good fish. That noble river, the Margaree, which has been netted and seined almost to desolation, affords annually a respectable yield of good sized fish which have in years past been put into that stream as fry.

Even the little Dunk River, in Prince Edward Island, in which a generation ago the capture of a salmon would scare an angler out of a year's growth, is now, I am informed, a fairly good salmon stream, it having been stocked artificially for several seasons.

If These Streams had not been Stocked.

Now, while it may be, and probably is, true, that The Old Angler is right when he states that the catch of salmon has lessened annually since the practice of artificial propagation began, it seems plain to me that the decline of the fishing is not attributable to the practice; for if no efforts had been made to keep up the stock, the catch would have lessened much more quickly than it has, and the occupation of netters and weir men would now be gone.

The Netters Get the Cream.

Now, as I have already stated, I agree fully with The Old Angler that the privileges now enjoyed by netters should be sharply curtailed, for this is a doctrine I have been preaching for upward of twenty-five years. I have lost no opportunity to put it forth, and I believe that

every one who is interested in the matter should spare no effort to bring it about.

In 1886 I stated in a public address, printed in part subsequently in "With Fly-Rod and Camera," that in such rivers as "the Penobscot and Margaree a few weir owners and netters are reaping a rich harvest from the work done by the commissioners, and the Government pays the bills. It is preposterous that a crop sown by the people should not be harvested for the benefit of the whole people. * * * I believe that since they reap the chief portion of the harvest, the netters should pay a liberal share of the expense of planting it, or else their privileges should be greatly curtailed. * * * Unless something is done, salmon will grow scarcer, no matter how many are planted."

A Howl Will Go Up.

Individual or spasmodic attempts to secure proper legislation will not be of much avail, and concerted efforts by the press and all who are interested in this important matter should be made, and speedily at that.

A number of years ago I attended a great many legislative hearings on matters pertaining to the fisheries, and when any attempt was made to curtail privileges that weir men and netters enjoyed, those men were out in force, and with an array of legal advisers that was almost overwhelming; the fight they waged against those who attempted to bring about a reform was bitter in the extreme, and a similar experience will be the outcome when an effort is made to save the salmon, to right what is now one of the most palpable of wrongs.

While it is not impossible that the American and Dominion Governments may be made to see the wisdom of repressive measures in salmon netting, it will require no little effort to bring this about, and such men as The Old Angler, who know the facts thoroughly, should gird on their armor and begin the good fight.

An Ever-Widening Market.

To one who is not familiar with the fact, the demands made by the ever-increasing market for fresh salmon are not well understood; there are such demands, and they are daily growing wider and wider, and to meet them the efforts of the netters and weir men will increase proportionately. But no matter how great the supply they secure may be, it will fall far short of the demand. I venture to say that the city of New York alone could consume, even at the existing high rates, every ounce of the catch of Atlantic salmon that is annually made, but only a small portion of it reaches that city. There are thousands of pounds sold in its markets for Penobscot salmon, which were never taken east of the Rockies, and a fresh caught fish with bright eyes and red gills is a rarity. As for the delicious fish taken in the waters of Nova Scotia, I doubt very much if many of them ever pass the limits of Boston, and there is no probability that this condition of things will improve. The main reliance of our consumers, therefore, will have to be placed, so far as fresh caught salmon are concerned, on the catch of the netters of the Baie des Chaleurs and the St. Lawrence, and that there is a probability that this supply will soon fail, there is not, in my mind, much doubt. As The Old Angler truly says, "We cannot eat our cake and have it, too;" and in order that there may be a future supply of salmon, we must curtail considerably the encroachments made upon the present one.

Keep up the Good Work.

But even if the netting of the fish is so restricted that the nets must be lifted five or six days in the week, the salmon that would ascend the rivers could not, by their natural method of procreation, keep the stock sufficiently large to withstand the drain made by the nets even if they are down only but one or two days in the seven, and it seems to me that the natural method should be supplemented by the artificial one, and that the hatcheries, instead of being closed, should be pushed to their utmost capacity, and that the various commissioners and other officials who have the matter in charge should have much more ample means than are now placed at their disposal, and increased power to secure the enforcement of proper restrictive laws.

What Netting Has Done.

The Old Angler has shown how the Western catch has been diminished by over-fishing, and we have had many

examples of its evil results on the Atlantic Coast. In the reports of the United States Commission will be found abundant evidence of the destructiveness of weirs, seines, pounds, etc., and I have quoted at considerable length in past issues of FOREST AND STREAM from the facts that have been given; but the fish that were captured were all species which breed in salt water, which have a greater range and more ample opportunities for reproduction than have those which are restricted in spawning to rivers. Now, if those marine species could be brought to such a near point to extirpation as to make fishing for them with hand-lines entirely futile in numerous places where such fishing was formerly the calling of a large class of men, we can easily see that a river-breeding species, if closely pursued, had but little chance for its life.

Connecticut Shad.

As an example of this I will cite but a single instance. A number of years ago—how many I cannot now say, for I have no memoranda by me—the Fish Commissioners of Massachusetts endeavored to stock the Connecticut River with shad. A large number of fry were put out, and the experiment proved so successful that the river teemed with the fish; they grew and waxed to a good size, descended the river to the sea, and returned again, and the prospect seemed good that the river should regain its value as a home for shad, for which it was in former days so famous. But the seines and weir owners at the mouth of the river and along its lower shores soon became alive to the presence of the fish, and their traps were set so thoroughly, and, I think, unrestrictedly, the fish were captured almost to the last fin. Massachusetts had the satisfaction of proving that the shad could be restored to the river, and paid the bills, but Connecticut netters and trap men reaped the harvest that had been sown.

Gut for Casting Lines.

In the issue of FOREST AND STREAM above noted, Mr. Chambers had some interesting jottings, particularly the **one relating to silk-worm gut and its preparation**. Some twenty-five years ago my father conceived the idea that he could secure a supply of superior silk-worm gut from our native worms. By great and persistent effort he succeeded in procuring a number of the larvæ of the great Cecropia moth, which he bred in captivity until his stock numbered, in the course of two or three years, over a thousand worms. To show how patiently he worked, I will state that his first year's supply numbered but five or six larvæ, which matured, spun their cocoons, completed their transformation, and emerged from their silken homes in the spring perfect moths. The sexes, fortunately, were about evenly divided; from these a supply of eggs was obtained which proved fertile, and his new stock of caterpillars numbered many hundreds. The larvæ of the Cecropia moth feed principally on oak and maple leaves, and an abundant supply of its food is therefore always to be obtained, which is not the case with ordinary Chinese silk worms, which require for food the leaves of the mulberry.

Raising Silk Worms.

He was very successful with his worms, and when he began his experiments in taking their silk supply he had an abundance of material at his disposal. Those great green larvæ were almost double the size of the Chinese or European worm, and their silk supply was consequently much greater than is that obtained from the other species.

His worms were immersed for twenty-four hours or more in vinegar, a portion having been put in strong cider vinegar, and the others in what is called white wine vinegar, which is, I think, made from acids and not from grape juice. From those which were placed in the cider vinegar he obtained a great number of strands of remarkably stout gut, many of which exceeded eighteen inches in length; nearly half of these were round throughout their entire length, but in the others there were flat sections extending sometimes half the length of the gut. The perfect strands were stretched and dried, and from some of them we tied some leaders, such as we had never before handled; the flat strands could never be utilized. He tried in a number of ways while the gut was soft and plastic to make the flattened portions round, but all his efforts were futile, and the gut was wasted.

Now, there was no apparent difference in the health

or condition of the worms; they were all perfectly developed, large and plump, and that one-half of the silk when drawn out should be flat could not be accounted for. My father believed the orifice through which the silk secretion was drawn was in some cases not opened to its full capacity, which caused the secretion to be squeezed flat in places.

On account of other pressing work, he was obliged to discontinue his silk-worm culture, and it now rests with future experimenters to ascertain whether or not a desirable gut may be obtained from the American worm. Anyone can carry on the work, for the worms are not at all uncommon in oak woods, and they may be easily kept in captivity, provided they have an abundant supply of food. If no caterpillars are found, one—by searching diligently among fallen oak leaves—may find two or three cocoons, which should be kept in a cool place through the winter; in the spring the moths will hatch, mate, and lay their eggs, from which in a short time minute larvae will be hatched.

How to Feed the Worms.

In caring for them, a simple outfit only is needed; on a bench or table set in a house room or shed, a board or plank is laid, in which a number of holes are made large enough to receive the bottoms of several bottles; a half dozen would be enough for quite a colony. The bottles are filled with cold water, and into them a small branch of oak or maple in full leaf is thrust, the space around the branch in the neck of the bottle being packed with cotton wool to prevent the worms from crawling into the water. Alternate bottles only should be used for the first feeding; that is to say, if six bottles are used, Nos. 1, 3, 5 only should hold the branches; the little worms are then placed on the leaves, and they immediately begin to feed. As soon as the leaves are devoured, bottles Nos. 2, 4, 6 should be utilized in the same manner, and the worms will quickly crawl from the denuded branches to the fresh ones, provided they touch. No other attention is necessary, except a moderate sprinkling of the leaves with clean, cold water once or twice a day. The caterpillars will grow rapidly, and when they are ready to spin their cocoons, will have attained a length of about four inches. At this period they will become restless, and seem apparently in search of a suitable place for their cocoons, and it is then they are in proper condition for immersion in vinegar.

EDWARD A. SAMUELS.

A Summary of a Good Time.

A MONTREAL correspondent sends us this concise story of an enjoyable outing in the Laurentian Hills country of Quebec, last autumn. It may at this time help some brother of the angle who is questioning where he shall put in the vacation that is "coming to him" this year. He writes:

The following describes a very pleasant outing of sixteen days among the lakes of the Shawiniga Fishing Club. We told our friends that we were going fishing; however, we armed ourselves with a shotgun and two rifles. The writer had the pleasure of seeing for the first time a moose and a caribou, which we left in the woods; we emptied a magazine rifle at the former, which made him run away, and he is probably, for all we know to the contrary, still running. As to the caribou, as luck would have it, we were not armed at the moment of his visit, and by the time we had acquired the shootin'-irons he had "scooted." We have come to the conclusion that it is useless going after big game with a shotgun and fishing-rod.

The trout was all that could be desired; in some spots the beauties took anything that was offered them; the Parmachenee-belle, however, held first place, with the scarlet-ibis a good second.

Leaving the lakes, we got into the Mattawan River, and there secured some 10-pound pike and 5-pound doré, with the new spoon bait; I do not know the name of it, but it zig-zags instead of revolving. This same bait took whitefish and trout. Other animals seen were lynx (wildcat), muskrat, and there were loons, ducks, partridges; we shot enough of the latter, going over the portages, to vary the "pot." Incidents of trip: Upsetting of a canoe in eight feet of water, owing to guide pushing us into a hornets' nest on a bough overhanging the water; and the killing of a snake whose bulging center excited our curiosity so much that we split him open, when out walked a live frog, which hopped away into the lake, all the same as if it had not been guilty of doing the "Jonah act." Weather delightful. No flies. Time of vacation, from the 5th to the 21st of September. Location, Laurentian Hills, northwest of Three Rivers, P. Q., Canada.

P. S.—The work of the industrious beaver was in evidence, the law prohibiting interfering with him. We discovered two lakes within 20 feet of each other; the water in one was 4½ feet higher, caused by a dam built by the ingenious creatures.

E. W. M.

A Napoleon of Fishing.

THE Springfield Republican relates that Napoleon Johnrow, of North Adams, Mass., went fishing for trout Sunday in the Warriner Brook, in Hawley. He got a lot of small trout, and got caught by Deputy Game Warden E. C. Hall, of Buckland, who had him before the district court. Charges for catching trout less than six inches in length and fishing on the Lord's day were preferred against him. To both he pleaded guilty, and was fined \$10 on the first count and \$5 on the second. Mr. Hall stated that he would be satisfied with a small fine in each count. Johnrow has a family of seven children. He proved a lively sprinter when discovered by the game warden, and led him a smart chase of ten rods or more before he could be overtaken. The trout undersized numbered 93, and some of them were no larger than the fingerlings placed in streams by game clubs. The effect of such convictions is wide reaching, for the reason that other offenders will take heed thereto and be more careful. In connection with Sunday fishing, the statement was made yesterday by a man of undoubted veracity that last Sunday a Greenfield man went out and caught seven pounds of trout.

The Waters Webster Fished.

THE members of the Massachusetts Association who were most active in the work of stocking the State with quail this year, were Messrs. Reed, Kimball and Dimick. Mr. Reed tells us that he managed to vary his work at this and other things by a little trout fishing in the old Websterian brooks in Cape Cod. We take the liberty of quoting his letter, and giving with it the photos he sends us:

"In my fishing," he writes, "I have had some pleasure, though on no afternoon have I taken more than seven;

A CAPE COD SUMMER HOME.

but in all I have taken 26 trout, weighing 30 pounds; only two were under ½ pound, and one beauty, taken only six rods above tidewater, weighed 3½ pounds. How old Daniel would have gloated over him; and how good he was to eat, boiled, with cream sauce.

"Mrs. Reed goes down to the Cape with me to-morrow to open, formally, our little house, and Teddy goes with

FROM THE COTTAGE PLAZZA OVERLOOKING TRIANGLE POINT.

us. Teddy is the smallest fox terrier you ever saw, but the spunkiest; he has licked every dog on Commonwealth avenue this winter, and now is ready for woodchucks. Last fall I trained him on quail and partridges, and he did very well, but would leave their tracks every time for a mouse or squirrel."

The picture of the Cape summer home shows Teddy in the foreground; the other is a view from the piazza over Triangle Pond.

Mr. Hughes Leads.

SEATTLE, June 20.—Encouraging reports are received from the different fishing grounds in Western Washington. Lake Cushman, Lake Crescent, and even Lake Washington, with its large stock of perch, have all produced good sport. Most of the rivers that flow into the Sound are getting better as the season advances, and fly-casting is taking the place of salmon egg killing.

One party got 156 trout in Cedar River last week, and William H. Finck took seventeen with a spoon near the old pumping station on Lake Washington. It is not safe, however, to judge general conditions by what Mr. Finck brings in. He has a faculty of making the fish bite when those in other boats are wondering what has become of the finny tribe.

The luckiest of the local anglers is Edwin Hughes, of the Butler Hotel. He has just returned from Lake Cushman, where he was the guest of A. H. Anderson. With a 4¼-ounce rod he killed a 6-pound Dolly Varden trout. The fight lasted for thirty-five minutes, and was about the most exciting experience of Mr. Hughes' life.

Last evening Mr. Hughes partook of an excellent dinner with wine trimmings at the expense of A. H. Anderson, the well-known local capitalist. Mr. Anderson is a veteran fisherman, and thought he would show his guest how the gamy trout of Lake Cushman and the wild-running Skokomish River are scientifically hooked. After Mr. Hughes had been duly armed with a sufficient supply of tackle to last him a year or so, including the frail 4¼-ounce rod, Mr. Anderson remarked in a casual manner: "Say, Hughes, I will bet you a bottle of wine that I beat you every day we fish."

"All right," replied Mr. Hughes, "it is a go." Now, Mr. Anderson has fished from one end of the country to the other, and is generally credited with about as much skill in luring the shy trout from his shady home under logs and overhanging banks as he is in figuring the total number of feet in a section of timber after casually walk-

ing through it. But he reckoned without his host when he made the bet with Mr. Hughes. Every night the count showed that Mr. Anderson was out a bottle of fizz. On the last day the big contest took place. Now, Mr. Anderson is a physical giant, while Mr. Hughes is rather frail.

"We will take the rapids in the Skokomish, below the lake," said Mr. Anderson. "It is a shame to take advantage of him," thought Mr. Anderson to himself, "but I must do something to regain my lost laurels."

In a frail canoe they shot down the river to the fishing ground. The water tumbled and foamed as it rushed along between and over the jagged rocks. In one place a big log, the remains of a fallen monarch, lay well out in the stream. With a swish the current swept over it, making the footing not only very insecure, but even dangerous.

On this danger spot Mr. Anderson camped, while Mr. Hughes, handicapped, sat in the canoe disconsolate. Luck favored Mr. Anderson from the first cast. With a twist of the wrist he landed a trout that weighed about a pound. Then another that tipped the scales a little more came swinging in. Mr. Hughes saw defeat staring him in the face, and gladly accepted the invitation of the Indian guide to shoot the rapids and try the sport at the second rushing of the waters.

As the canoe shot down the treacherous course, guided by the skillful hand of the Indian, Mr. Anderson smiled. He had Mr. Hughes on the hip for once in his life. Twelve beauties were in Mr. Anderson's creel when he saw the canoe coming slowly up the river.

"Got anything?" yelled Mr. Anderson. Mr. Hughes held up a 4-pound Dolly Varden.

"Who got it?"

"Allen, the guide," replied Mr. Hughes. Just then the canoe came up to where Mr. Anderson was standing, and to his amazement he saw a 6-pound Dolly Varden lying in the front end of the canoe with Mr. Hughes' fly in its mouth.

In his amazement Mr. Anderson forgot all about his twelve little trout, the largest of which weighed only one pound and a quarter. He was inclined to think that Allen had played a joke on him, but in a private conversation said that Mr. Hughes had killed the king of the stream after a fight lasting thirty-five minutes.

"When I made the cast," said Mr. Hughes, "I got a bite, and it seemed to me as if I had the Butler Hotel on the other end of the line."

It was an exciting time that Mr. Hughes and the guide had after running the first rapids. As they approached the second and came to the big black pool near the head of the swift water, Allen said to Mr. Hughes, "Cast in there."

No sooner had the delicate fly touched the surface than there was a rush, and the frail rod almost doubled up under the strain.

"Don't give him any slack," yelled the guide in excitement. Mr. Hughes was equal to the occasion, and held fast for the rush that was sure to come. Away went the monarch of the pool, and the reel clicked off the yards of line with a musical hum. Then Mr. Hughes took advantage of the first signs of slowing up to make the turn. Slowly he brought the monarch of the pool toward the canoe; then came another rush, and it was only by quick work that the hook was kept in his mouth. It was a glorious fight, but with each successive rush the struggles of the captive became weaker, and finally he was lifted in.

As the party went homeward, Mr. Anderson took off his hat to Mr. Hughes, with the remark: "Well, you wiped my eye every day; I acknowledge the corn."

The two trout were frozen in ice, brought to Seattle, and last evening aroused no end of curiosity and admiration.

PORTUS BAXTER.

Fish Mortalities in Massachusetts.

HEARING of the mortality of fish in the western part of the State this spring, Capt. Collins, chairman of the State Fish and Game Commission, sent out there Dr. George W. Field, formerly connected with the Institute of Technology, but now the biologist in the employ of the Commission. Dr. Field returned this afternoon, bringing a specimen of a dead pickerel, showing the cause of its death, and having in his possession the facts about the mortality among the fish, which will interest people of the locality and sportsmen all over the State. This pickerel, which has been slit along the belly so as to show its internal condition, has upon its liver a number of small, roundish white spots. These are the cysts in which are contained the worms which cause the death of the fish. It is the theory of Dr. Field that the fish swallows the eggs of the worm. They are hatched in the stomach, pass into the liver, and into the walls of the stomach, where they encyst themselves. There they grow to be from a quarter to half an inch long, and develop into a lively white worm. Then they eat their way into the cavity of the body, causing death. This probably happens in most cases early in May or in the early summer. This particular specimen was taken in Pontoosuc Lake in Pittsfield, and Dr. Field found the same trouble in Onota Lake and in Cheshire Lake. It is supposed to be spread widely in the lakes and streams of the State. Last year complaints of the same trouble came from Cape Ann. The species which are known to be affected in this way are pickerel, red perch, shiners, suckers, pout and roaches. The fish sinks to the bottom of the water when it dies. In about twenty-four hours the generation of gases in the body makes it float, and Dr. Field found one bunch of fifteen, another of three, another of four, and another of seven along the shore of the lake in about a half a mile. He rowed twice across the lake from about opposite the boat house of the Young Men's Christian Association, and found two pickerel, two red perch, and six shiners, and two which he could not distinguish, floating on the surface of the water. This spring there has been great mortality among the menhaden in Narragansett Bay. The other day Capt. Collins and Dr. Field went there and saw several of the fish, apparently in their death blindness, flying around on the surface of the water, seeming in much pain. This trouble is supposed to come from some germ disease, but the cause is not positively known. —Springfield (Mass.) Republican.

The Jewfish [in Virginia.

ST. LOUIS, June 23.—On August 18, 1903, Captain Payne caught in a pound net at Virginia Beach a jewfish, a fish which has not previously been recorded in Virginia waters. The fish is not uncommon on the Florida coast, and inhabits both coasts of tropical America from Florida and the Gulf of California southward to Brazil.

Another name for this species is *Guasa*, by which it is known in Cuba and other parts of the West Indies. The jewfish, or spotted jewfish, sometimes attains to a length of six feet, and is said to weigh as high as 400 pounds. It takes the hook readily, but is not noted for game qualities, and is not especially good to eat.

Mr. J. Lyman Babcock, who is in charge of the Virginia Fish and Game exhibit in the Forestry and Fish and Game Palace at the Universal Exposition, was informed by the fishermen that this fish is a kind of sea bass; so it is, in so far as it belongs to the sea bass family, but it is a giant in comparison with its family relations. The jewfish is a great deal more akin to the groupers than it is to the sea bass proper. It frequents the vicinity of rocks, and takes the hook very freely. The angler who takes a jewfish makes a great catch, although it can scarcely be said to offer much more excitement than a big codfish.

It seems rather singular that the recorded range of this fish should be amended as one result of the great Exposition; but the Virginia coast will doubtless furnish further surprises to the naturalist who will carefully examine its shores.

TARLETON H. BEAN.

A Fish Like a Dead Leaf.

IN a recent number of a periodical devoted to Ceylon and its environs, attention is called to a remarkable instance of protective mimicry in a Ceylon fish, known as sea bat (*Platax vespertilio*), which resembles a dead and decayed leaf. Dr. Willey, who records this example, had already had his attention directed to the matter by a correspondent, and subsequently saw with his own eyes an example of it.

He says: "I was walking along the reef in the company of a fisherman carrying a net, when he espied a small fish which he attempted to catch for me. I could not see what it was at first, but noticed that the man failed to bag it after several ineffectual attempts. The fish did not swim far away from the spot, but dodged about, baffling its pursuer. I approached and seized the net, whereupon I saw a yellow jak leaf gently and inertly sinking to the bottom. This is no unusual sight, and I was about to turn away, when the leaf righted itself and darted off. Efforts were redoubled, and the fish secured and sketched."

Dr. Willey adds: "When a fish has a leaf-shaped and leaf-colored body, and in addition the unique habit of toppling over and feigning death when pursued, it seems natural to conclude that it is a genuine example of protective resemblance."

To Keep Camp Provisions from Flies.

NEW YORK.—*Editor Forest and Stream:* In Mr. Martin Hunter's very instructive contribution to FOREST AND STREAM for June 25, he speaks of keeping "blue flies" away from meat and fish by means of coverings of birch bark. By "blue flies" he probably means what we commonly call "blow flies," and if blue is past tense for blow, the flies will never get that far if the camper is aware of the little trick of suspending things about twenty feet above the ground. A very small block and tackle in one's outfit weighs only a few ounces, and this, carried up into the branches of any convenient tree, will serve to run even a saddle of venison above the level of fly-line, which seems to be about as definite a thing as timber-line. My old guide, Caribou Charley, made twenty feet his rule, but last summer I experimented with a series of lake trout, hung at distances varying from the ground level to twenty feet above, and found that the flies much preferred the ground level, gradually tapering in abundance up to about seven feet, and not a fly at ten feet. This was in Maine. There may be localities in which other species of flies will be less accommodating.

Sometimes when trees were not near camp, we have sunk meat and fish under water, in order to keep flies away, but the flavor usually ran down stream pretty fast.

ROBERT T. MORRIS.

Where the Maple Bends.

THE two views of the Maple River are from photographs which are sent to us by Mr. C. L. Lockwood, who is the General Passenger Agent of the Grand Rapids and Indiana Railway. We print the pictures simply to expose Mr. Lockwood's nefarious business, which is to separate husbands and fathers from their families, and send them packing off to the wilds of Michigan, where the Maple bends, and where several and sundry other trout and bass and grayling waters hold them in captivity. It may be that though our single purpose is to hold up to the light of day and the censure of mankind these business methods of Mr. Lockwood, our good intention may largely defeat itself, since it is just like a fisherman, when he sees a fishing picture of this kind, incontinently to desert his family and take to the woods. To do Mr. Lockwood justice, however, we may add that he rather encourages anglers to take wives and sisters along on these Michigan outings. In fact, the more the rest of the family sees of the pictured charms of Michigan, the less inclined are they to let the head of the house go off without them.

To Do the Carp Try Seals.

SAN FRANCISCO, Cal.—Your correspondent in a recent issue who seems rather to lament the fact that it is unlawful to take carp with seine or spear, may console himself with the reflection that even though it were not unlawful, he could accomplish little or nothing to rid his ponds and streams of the nuisance by those means.

Some years ago our water company got the carp fever, and put a lot of them into one of the lakes to purify (?) the water. They thrived amazingly, and grew to enormous size. Then it was discovered that they were be-

coming a great nuisance, and people were allowed to fish for them, only to find that they wouldn't be caught.

Some Italian fishermen were invited to take them out with their big nets, and, I think, tried it once. The next time they were invited they had to be paid to come. Then we got a net ourselves and fished vigorously, only to find that after the first one or two hauls we caught nothing, for as soon as the net got into shallow water and the carp couldn't get under it, they went out over it in shoals, and that idea had to be abandoned. Meantime they rooted around on the bottom of the lake like a drove of pigs, and kept the water constantly stirred up, so something had to be done. We next tried seals, which were caught outside the harbor and brought in, until we had of seals and sea-lions, I think, at one time nineteen. The seals seemed perfectly comfortable in the fresh water, and two little chaps born there thrived and grew as well as any seals, and became quite tame.

In the course of time they cleared the lake out so completely that they were in danger of starvation, so some were assisted to escape to the ocean, while the larger ones had to be shot. Now the carp are getting bad again, and a net seems just as useless as ever, but the keeper has an idea (don't know how much truth there may be in it) that the black bass in the lake are keeping the carp from increasing in numbers by eating all the small fry, and that the carp which are stirring up the mud are survivors of the last generation who escaped the seals—perhaps on account of their small size—and have since grown up, as all the fish that he has been able to drive into shallow water were large—but they went over the top of the net in the same old style. ***

Massachusetts Black Bass.

MASSACHUSETTS has repealed the law making a close season on black bass. The only law applying to black bass is contained in Sec. 70, Chap. 91, of the Revised Laws, which prohibits the taking, selling or having in possession, "with intent to sell, a black bass less than eight inches in length."

A well informed Boston correspondent writes us: "So far as I have met the people in visiting various towns and cities, the repeal of the act above cited has met with much objection. Those interested claim they knew nothing of what was being done, despite the advertisement of the bill, and keenly regret what has been done. If what has been said is any indication of a general feeling of dissatisfaction, then it is safe to assume that an attempt will be made next session of the Legislature to secure the re-enactment of protective laws for black bass."

Four Fish with One Hook.

BUFFALO, N. Y.—*Editor Forest and Stream:* A friend of mine has just told me of a funny incident which came under his notice while he was fishing at Black Rock yesterday for pike perch. He was fishing from the bank, and below him was some old fellow in a boat, who had been fishing in poor luck and had not caught a fish. He lost a hook on something which it caught in and then put on a new one. After a while he thought he had a bite, and put the strain on the pole, which was a cane one. When his hook reached the surface he found he was caught to a small rope. He took hold of the rope and pulled in a "squat" net, which had four blue pike in it, thus catching four fish while using only one hook.

DIXMONT.

Man Had No Hand in It.

CONSUL BENJ. H. RIDGELY writes from Nantes, France; "During the years 1902 and 1903 there was an almost complete failure of the French sardine catch, an industry of which the center of trade is Nantes. It now seems certain that the absence of sardines last year and the year before was due solely to the cold and boisterous spring. This spring, which has been a normal one up to date, finds the smaller variety of the famous little fish already on hand in abundance, and the packers look forward to an excellent catch."

This is only another instance of a fluctuating fish supply in which man had no part; it goes with the bluefish and mackerel ups and downs.

Good Fishing at Lake Dunmore, Vt.

BOSTON, June 23.—*Editor Forest and Stream:* The fishing in Lake Dunmore is very good at present. A party of six spent three days at my cottage recently, and in the three days we caught 24 pickerel and bass, averaging 4 pounds apiece. The party consisted of Mr. and Mrs. Eldric Eldridge, of Jamaica Plain; Mr. and Mrs. Hunt, of Lexington; and Mr. and Mrs. E. C. Stevens, Lexington, Mass.

E. C. S.

How Do You Preserve Minnows?

TOLEDO, O., June 17.—*Editor Forest and Stream:* Can any of the readers of "our paper" give a practical and effective method of preserving minnows which will not interfere with their subsequent use for bait? Salted minnows are apt to become too hard and brittle, and while those on the market are good as far as they go, they do not go far enough. Then it occasionally happens in the fishing country that we have a surfeit of live minnows at times, but none at all at others. Suggestions thankfully received.

JAY BEEBE.

Death of Vaughan Snider.

WE regret to learn of the death of Vaughan Snider, editor of The Amateur Sportsman, and secretary of the M. T. Richardson Company, at his residence, this city, Sunday morning, June 19, after a short illness. Mr. Snider was born in Philadelphia, November 21, 1858. In his youth he learned the trade of a printer, and later occupied a position on the Crockery and Glass Journal. He was for several years foreman of the printing house of Gibb Brothers & Moran. He became editor of The Amateur Sportsman when that journal was purchased some years ago by the M. T. Richardson Company, and retained this position until his death.

Adirondack Fishing.

BLUE MOUNTAIN LAKE, New York, June 21.—*Editor Forest and Stream:* Your readers may be interested in hearing of Adirondack conditions, so I will speak of those things on which I am informed. Trout fishing in the streams and ponds has been unusually good. The leading merchant here tells me he never saw so many trout for sale as this spring. Many parties have been to one pond a few miles away, where brook trout abound—the average size being about 1/4 pound—and it is estimated that 700 pounds or over have been taken there. No very large fish are reported so far.

JUVENAL.

Cathance Lake.

COOPER, Maine, June 21.—At Cathance Lake this week, Mr. R. A. Roach and J. F. Harrington, of Boston, Mass., landed seven salmon that weighed 21 1/2 pounds, and eleven trout that ran from 1/2 to 3 pounds, and one that weighed 4 3/4 pounds. Senator McIsaac, of South Boston, got a good string of trout and salmon, one salmon weighing 5 pounds. Mr. Morgan, of Pembroke, had very good luck; he landed three trout that weighed 10 1/2 pounds, and two salmon 3 1/2 and 4 pounds each.

THOMAS DEEREY.

In Newfoundland.

Mr. L. F. BROWN, of this city, has gone salmon fishing in Newfoundland.

Mr. H. O. Wilbur, of Philadelphia, is spending his vacation on Newfoundland streams.

British Columbia Salmon.

THE Dominion Government has ordered that "the export for the purpose of canning or manufacture of fresh salmon captured in trap nets in the waters of British Columbia shall be prohibited."

Ever Tested It?

When the wind is in the north,
The skillful fisher goes not forth;
When the wind is in the east,
'Tis good for neither man nor beast;
When the wind is in the south,
It blows the flies in the fish's mouth;
When the wind is in the west,
Then it is the very best.

100 Sportsmen's Finds.

Some of the Queer Discoveries Made by Those Who Are Looking for Game or Fish.

97

WONDERFUL stories are often related of the loss of precious articles and their marvelous recovery, such as the dropping of a watch overboard while fishing, and later recovering it from the stomach of a pike; dissecting gold rings from the inwards of trout which snapped the glittering toy before it reached bottom; digging a set of false teeth, lost when bathing, from the stomach of a catfish, etc. But truth is stranger than fiction. Anybody who will can lie, but here is a true story of James H. Prentiss, of Ann Arbor, who while fishing at Zukey Lake lost the \$200 setting to his diamond ring. Hoping that the glitter might have attracted a bite from a pickerel, which grabs greedily for a flashing spoonhook, every fish caught was carefully dissected, and Prentiss had just about given up hope of beholding his \$200 sparkler again, when, as the last fish had been ripped up the front, behanged if the gem wasn't found wedged between two boards in the bottom of the boat.—Detroit Tribune.

Dog's Return Journey.

A REMARKABLE instance of a dog's love of home is reported from Cromlegh, Dunblane, Perthshire. A collie dog was given to Mr. Hunter of Herriotshall, Berwickshire, by his brother-in-law, Mr. Gilholm, of Cromlegh, and was sent by train to the borderland. The animal worked among the sheep for two days, and then suddenly disappeared. It afterwards turned up at its old home, having done the seventy miles' journey in forty hours.—London Telegraph.

The Out-of-Doors Man.

Give me a boat, a rod and a gun
When summer days are long,
Up where the creek comes winding down,
And you may have your life in town,
Your women, wine and song.

Give me a lonely, wooded walk,
Where feet have seldom trod,
And you may have your boulevards,
Cut paths and artificial yards
Laid out by rule and rod.

Give me an open blazing hearth,
A kitchen low and long;
A good old country dinner rare,
And you may have your hotel fare,
With its dyspeptic throng.

Give me a hard and horny grasp,
An honest, fearless eye,
A skin that's rough and weather-tanned,
And you may have the limpid hand
Of aristocracy.

—Joe Cone in the New York Sun.

All communications for FOREST AND STREAM must be directed to Forest and Stream Pub. Co., New York, to receive attention. We have no other office.

Brooklyn Y. C.

Bensonhurst, L. I.—Saturday, June 25.

Twenty-two boats started in the forty-seventh annual regatta of the Brooklyn Y. C., which was held on the afternoon of Saturday, June 25, over courses in Gravesend Bay. The race was also the first of five to count on the championship of the season among the clubs located on that body of water, which includes, besides the organization under whose auspices the regatta took place, the Atlantic and Bensonhurst Y. C.s, the Marine and Field Club and the New York C. C.

The leaders in the different classes were Bobtail, Bonito, Miss Judy, Beta, Kelpie and Martha M. Redwing and Sandpiper scored sailovers. Beta and Kelpie being of one-design classes are sure of victory. The other craft were competing on time allowance, according to the new rule of rating. A number of them have not been measured, and it was thus impossible to ascertain corrected times. It is thought, however, that the classes in which Bonito and Miss Judy led are the only ones in which boats finishing first may possibly not be the actual winners.

Competition for the association championship is on the point system, in which a craft gets one point for every opponent she defeats, and an additional point as a premium for starting and finishing the course. Sailovers count a point. No awards can be made until corrected figures are at hand.

A good S.W. breeze was blowing just before the start, making it advisable to send the yachts over the reverse courses, leaving all marks to port. Shortly after the last boat had gotten away, however, the wind shifted into the westward, making very little windward work for the boats in Classes P and under, which sailed the inside journey.

Classes M and N sailed twice over the new association course. They had reached to the Marine and Field Club mark and the one at Port Hamilton, from the start off the Brooklyn Y. C. anchorage. Windward work was necessary to bring them around Craven Shoal buoy. The next leg, to a stake boat off the Atlantic Y. C., was a reach, and the journey from there home a run. Instead of going out to Craven Shoal, the other boats went on a long reach across the bay from Port Hamilton to Sea Gate.

Bobtail, Bonito, Beta and Kelpie were excellently sailed, the first named leading Bagheera by 3m. and 46s. at the finish of the eleven mile struggle. The summaries:

Sloops—Class M—Start, 3:05.		
	Finish.	Elapsed.
Redwing, J. B. O'Donohue.....	4 46 30	1 41 30
Sloops—Class N—Start, 3:05.		
Bobtail, E. F. Luckenbach.....	4 44 27	1 39 27

Brooklyn Y. C. Ocean Race.

In case of threatening or stormy weather the committee reserve the right to postpone the start until the conditions are considered favorable for sailing the race.

Start.—At 10 A. M., from off the club house, Gravesend Bay, on July 2. Line between judges' boat and flagmark; to be crossed from E. to W. One gun. High water, Governor's Island, 10:55 A. M.

Starting Signals.—At 9:45 A. M., preparatory gun and hoisting of blue peter on judges' boat. At 9:55 A. M., second gun and hauling down of blue peter. At 10 A. M., starting gun and hoisting of club ensign.

Course.—The gun is used only to call attention to the signals. From starting line to and around Nantucket Shoal Light Vessel, leaving same on port hand, thence to a finishing line off the station of the Boston Y. C. in Marblehead Harbor, Massachusetts.

Yachts after crossing the starting line may put to sea by any channel, and may pass on either side of Fire Island Light Vessel and the whistling buoys off the Long Island coast.

After rounding the Nantucket Shoal Light Vessel, yachts may pass inside of any other light vessel or whistling buoys, or may pass into and through Nantucket or Vineyard Sound, or any of the channels leading into those bodies of water.

They may make harbor and anchor as often as they consider necessary. No time limit.

Finish.—The finish line will be drawn between the station house of the Boston Y. C. and a vessel anchored S.E. from the station in Marblehead Harbor.

During the day the mark vessel will fly the Brooklyn Y. C. burgee; at night it will hoist three red lights, vertical.

The Boston Y. C. station is on the west side of Marblehead Harbor, just beyond Stearn's yacht yard. It is a two-story shingled house, painted a light green.

Reporting Withdrawal.—If, owing to stress of weather, or for any other reason, a yacht withdraw from the race the committee earnestly requests the owner to at once notify them by wire of the yacht's arrival in port, so as to relieve any anxiety through the vessel's not reaching Marblehead.

Telegrams should be addressed to the Regatta Committee, Boston Y. C., Marblehead, Massachusetts.

Reporting at Finish.—At the finish the skipper must hail either the mark boat or house, and give name and number of his yacht, and also take and enter in the logbook the time of finishing.

Rounding the Lightship.—All yachts must report at Nantucket Lightship by passing close to it and giving their name or number. The number can be shown at night by burning a blue light under it. As soon as the watch on the light vessel have made out the number or name they will show a light at night or a flag by day to acknowledge it.

The skipper must take and enter in his logbook the time of rounding the lightship.

Log.—The navigating officer of the yacht must keep a log, in which is entered the course, distance, direction and force of wind, state of weather, etc.; also the time of passing objects and vessels. In case of any dispute or doubt as to the yacht having

made the course the log will be admitted as evidence. This log or copy must be handed to the Regatta Committee upon the yachts finishing the race.

Caution.—If the wind is strong, or if a heavy sea or swell is running, yachts, after rounding the lightship, should on no account attempt to cross the shoals, but keep to sea, not going to the west of 69 degrees 40 minutes until north of 41 degrees 30 minutes. At such times the rips on these shoals are very dangerous. There is a strong tide sweeping across these shoals, and at times a heavy breaking sea.

D. G. Whitlock, James A. Donnelly, Charles E. Allen, Regatta Committee.

Eighteen boats have been entered for the race. The entries follow:

Holy Smoke, sloop, R. M. Lewis.....	40.0
Ray II., sloop, G. R. Hawes.....	37.0
Little Khody, sloop, C. F. Tillinghast.....	34.6
Ulula, sloop, W. H. Winship.....	37.8
Fanshawe, yawl, F. Maier.....	35.6
Rough Rider, sloop, W. A. Maxwell.....	29.0
Bonita, sloop, Haviland Brothers.....	39.0
Squaw, sloop, H. J. Heath.....	34.9
Mopsa, cutter, F. C. Sullivan.....	35.9
Eumareir, sloop, E. K. Hill.....	36.0
Naomi, yawl, L. A. Schmalholz.....	36.0
Sea Bird, yawl, T. F. Day.....	25.6
Mignon, sloop, Dr. Joseph Fournier.....	36.6
Nymphia, sloop, Frederic R. Bogardus.....	32.6
Newasi, sloop, A. H. W. Johnson.....	38.6
Siren, sloop, C. F. Wigand.....	38.0
Emma C., yawl, Frank D. Perkins.....	38.0
Siren, sloop, A. Marshall and C. H. Madden.....	31.4

American Power Boat Association.

New York, Hudson River—Thursday, June 23.

The first of the three days' racing for the gold challenge cup, offered by the American Power Boat Association, began on June 23. The cup is rather a handsome piece and was designed by Mr. Paulding Farnham, and executed by Tiffany & Co. It would seem that the beauty and value of this trophy would have attracted enough owners of speedy power craft to make the races an unequalled success. This was hardly the case, however, as the starters were so few that the races were of little or no interest, and but few people took the trouble even to make the short trip to the attractive home of the Columbia Y. C., off which the contests were started.

The start on Thursday was to have been made at 2 P. M. At this hour only one boat, Standard, had shown up. So the start was delayed an hour.

A number of large and small steam yachts were anchored off the club house, and, as they were all dressed with flags, they added much to the scene. Before 3 o'clock, Water Lily and Fiat I. had materialized. At 3:05 the starting signal was given. Standard led over the line with Fiat next and Water Lily last. Water Lily managed to pass Fiat, although the latter hung on tenaciously. Standard was too much for her competitors and got away from them fast. About ten minutes after the start Fiat met with an accident and was forced to withdraw.

In the vicinity of 125th street Water Lily hit an obstruction, bending one of the blades of her propeller. This was most unfortunate, for, although the boat did not have much show of winning, still it hurt her chances. The course was from the starting line off the Columbia Y. C., sixteen knots straight away up the river to a mark off Piermont and return, a total distance of thirty-two knots.

Standard turned the outer mark at 3:53:40 and Water Lily rounded at 3:59:55. At this point Standard was leading by 6m. 15s. Standard increased her lead on the return to the finish line, and won the race by 5m. 24s. corrected time. Standard allowed 17m. 14s. to Water Lily, and 14m. 26s. to Fiat I.

The first half of the race the boats had a fair wind and tide, but on the home leg the fresh breeze made it harder going, as it kicked up quite a sea for Water Lily. Standard plowed along not minding the choppy water in the least and making big gains on her rival. Standard averaged 19.63 knots; Water Lily averaged 15.94 knots. Standard's elapsed time for the 32 knots was 1h. 37m. 48s.

The races are run on a point system, and, accordingly, Standard leads with 3 points, Water Lily 2 and Fiat I. 0. The summary:

First Race—Course, 32 miles—Start, 3:05.			
	Finish.	Elapsed.	Corrected.
Standard, C. C. Riotte.....	4 42 48	1 37 48	1 37 48
Water Lily, F. Seaman.....	5 06 26	2 00 26	1 43 12
Fiat, C. H. Tangeman.....	Did not finish.		

Friday, June 24.

In the second race for the association trophy, on Friday, there were but two starters, Standard and Water Lily. The day was even better for power boat racing than Thursday, as the water was not quite so rough on the last leg of the course.

The boats covered the same course as they did in yesterday's race. They had a fair tide for the first sixteen miles, while on the return they bucked the tide. The preparatory signal was given at 3:00, and five minutes later the boats started. Standard again crossed in the lead, although Water Lily was not far behind. Standard moved very fast and drew away from her competitor noticeably. Standard made better time than she did in Thursday's race. She rounded the mark at 3:50; Water Lily turned at 3:57:30.

It was a repetition of yesterday's race, for on the run home Standard continued to increase her lead. She beat Water Lily by 2m. 56s. Standard made better time over the course than she did in Thursday's race by 4m. 18s. The standing in points follows: Standard, 5; Water Lily, 3. Standard averaged 20:52 knots; Water Lily averaged 16:72 knots. The summary:

Second Race—Course, 32 Miles—Start, 3:05.			
	Finish.	Elapsed.	Corrected.
Standard, C. C. Riotte.....	4 38 30	1 33 30	1 33 30
Water Lily, F. Seaman.....	4 59 40	1 54 40	1 37 26

Saturday, June 25.

The third and last race of the series was held on Saturday, and Standard won again easily. The result of the race was a foregone conclusion, as Standard demonstrated her superiority over Water Lily in both of the previous contests.

Water Lily's owner, Mr. F. Seaman, protested Standard's measurement, but it is doubted if a remeasurement will make any change in the result of the match.

The boats covered the same course they went over on Thursday and Friday, the start being made off the house of the Columbia Y. C. The first mark was sixteen knots up the river off Piermont, thence back to the starting line.

The preparatory was given at 3 P. M., and at 3:05 the boats crossed almost abreast of one another. Standard soon moved into the lead, and, after a few minutes had elapsed, it was plain that, barring accidents, the race was hers. The boats were timed at the Piermont mark as follows: Standard, 3:52:43, and Water Lily, 4:03:31. Standard had gained 10m. 48s. on this leg.

The helmsman on Standard rounded the wrong mark, mistaking a fishing boat for the association's mark. The mistake was discovered in time, and the boat went on and rounded the right mark—this blunder cost Standard something over a minute.

On the return to the finish line Standard made better time, she finished at 4:39:21, and Water Lily at 5:03:26. Standard covered the first sixteen knots in 47m. 48s., and the last sixteen knots in 46m. 38s. Water Lily covered the first sixteen knots in 58m. 31s., and the last sixteen knots in 55m. 55s. Standard beat Water Lily 24m. 5s. elapsed time, and 6m. 51s. corrected time. Standard averaged 20.35 knots; Water Lily averaged 16.22 knots. The standing in points follows: Standard 7, Water Lily 4.

The deed of gift governing this cup states six months must elapse between the time a challenge is received and the races. It is very possible that this clause may be waived, so that other races might be held on Labor Day. The summary:

Third Race—Course, 32 Miles—Start, 3:05.			
	Finish.	Elapsed.	Corrected.
Standard, C. C. Riotte.....	4 39 21	1 34 21	1 34 21
Water Lily, F. Seaman.....	5 03 26	1 58 26	1 41 12

Seawanhaka Corinthian Y. C.

Oyster Bay, L. I.—Sunday, June 12.

Two raceabouts and three 15-footers sailed a race over course No. 10 on Sunday, June 12. The wind was light from the S.W. Owing to a squall from the N.W., the race was ended at the end of the first round. Natalie won in the raceabout class and Wee Wean beat Cayenne. The summary:

Raceabout Class—Start, 4:05.		
	Finish.	Elapsed.
Jolly Rogers, T. B. Bleeker.....	5 31 00	1 26 00
Natalie, F. G. Stewart.....	5 29 35	1 24 35

15ft. Class—Start, 4:10.		
	Finish.	Elapsed.
Cayenne, Colgate Hoyt.....	4 36 05	
Sabrina, C. W. Wetmore.....	Did not finish.	
Wee Wean, R. L. Cuthbert.....	4 36 00	

Saturday, June 25.

The thirty-fourth annual Corinthian race of the Seawanhaka Corinthian Y. C. was held on Saturday, June 25. It was an ideal day for a race, and a fresh W.S.W. breeze gave the thirty-eight starters an opportunity to see what they could do.

Weetamoe and Neola covered a twenty-three and a half mile course. The first leg was a reach, the second, a reach then a beat to the finish line. Weetamoe sailed a fine race and beat Neola by 3m. 2s. In Class M Spasm and Anotok were the only starters. This is the first time these boats have met this season. Anotok beat Spasm, something she did last season with great regularity. Alert, Mimosa and Nyke were the starters in Class N. Alert demonstrated her superiority over her two competitors by beating them easily. Snapper beat Firefly by a good margin in Class P. This was rather a surprise and makes one of the first breaks in Firefly's long list of first prizes.

Good racing was seen in the raceabout class, in which there were ten starters. At the end of the first round, Rascal was leading with but a few seconds to spare. Tartan pulled into the lead on the second round and finished a winner by 2m. 36s. Several protests were filed in this class, so the result of the race is still a question. Tartan was protested by Rascal, and The Kid was protested by Nathalie. The Leland challenge cup cannot be awarded in this class until the protests are decided.

In the Larchmont one-design class Dorothy won and Vaquero II. was second. Adelaide did not finish. Four of the Indian Harbor one-design boats started, and Owatonna finished first, with Kenoshi second. Wa Wa sailed over the wrong course. Sabrina made a good showing in the Seawanhaka one-design 15ft. class. Wee Wean finished second. Brownie fouled Cayenne and was disqualified. Plover beat her only competitor, Jebe, in Class R, and Scud easily defeated Why Not in Class W. The summary:

Class I—Sloops 60ft.—Start, 12:20.		
	Finish.	Elapsed.
Neola, George M. Pynchon.....	3 50 30	3 20 30

Manhasset Bay Challenge Cup Series.

Port Washington, Long Island Sound—Monday, June 27.

The first race of the series for the Manhasset Bay challenge cup was sailed on Monday, June 27. There were four starters, Alert, the defender, Mimosa, Nike, ex-Oiseau, and Bobtail. Mimosa won, Oiseau was second. Bobtail third, and Alert last. The race was a most unsatisfactory one over a windward and leeward course. The wind was light and variable, and all the boats, with the exception of Nike, led at some time during the race. A complete account of the races will appear in our next issue.

Corinthian Y. C.

Marblehead, Mass.—Saturday, June 25.

The first of the ocean races to be finished off Marblehead was that of the Corinthian Y. C., which was started off the club house Saturday evening, June 25. A severe thunder squall made it necessary to postpone the start for an hour, and for the greater part of the night the yachts sailed through more or less fog. The course was from Marblehead to the Isles of Shoals and return. From Thatcher's Island to the outer mark, both going out and returning there was a fairly good breeze, but from Thatcher's Island to Marblehead the air was fluky at all times. Even where the breeze was, it was streaky, so that it can only be said that the results depended more or less upon the fluky conditions. In Class A, Cossack won and led the whole fleet over the finish line. This was a natural win and was expected. In Class B, Sauquoit did the fastest sailing and had a big lead when Thatcher's Island was reached on the return home, but the flukes from this out caused her lead to be reduced, and although she finished first in her class, she lost on corrected time to Khalifa, which had also sailed a very good race. In the 22-footers, it was all Medric until the fluky conditions set in after Thatcher's Island was passed on the return home, and then she was forced to see first place go to Peri II., which had been miles behind her before. The summary:

Class A—Handicap.		
	Elapsed.	Corrected.
Cossack, H. A. Morse.....	13 41 00	13 41 00
Elaine, A. W. Chesterton.....	15 04 40	15 04 40

Class C—22-Footers.		
Peri II., George Lee.....	14 36 27	14 36 27
Setsu, Talbot and Lewis.....	14 39 35	14 39 35
Medric, H. H. White.....	14 40 28	14 40 28
Clotho, Cheney and Lanning.....	14 52 17	14 52 17
Warrior, S. C. Winsor.....	15 00 32	15 00 32
Urchin, John Greenough.....	15 01 25	15 01 25
Opitsah V., S. H. Foster.....	15 05 25	15 05 25
Athion, H. H. Walker.....	15 52 35	15 52 35

A club race of the Corinthian Y. C. was sailed off Marblehead on Saturday, June 25, in a moderate S.W. breeze. The 30-footers Chewink IV. and Sauquoit crossed the starting line almost together and sailed in company until the first mark was reached. On the windward leg Chewink IV. pulled out a lead on Sauquoit, which she held to the finish. In the 22-footers Peri II. turned the weather mark ahead, but Medric passed her on the next leg and held the lead to the finish. The eight 18-footers went over the starting line bunched. When half of the first leg had been covered Bat went into the lead and held it to the finish. In the first handicap class Carina II. won easily. In the second handicap class the 15-footers Tabasco, Jr. and Little Misery were the starters. Little Misery led until the windward leg, when Tabasco, Jr. went ahead and led to the finish. The summary:

30-Footers.		
Chewink IV., G. Macomber, Jr.....	2 05 35	2 05 35
Sauquoit, T. K. Lothrop, Jr.....	2 06 05	2 06 05

White Bear Y. C.

White Bear Lake, Minn.—Saturday, June 11.

On Saturday, June 11, a nice full sail breeze was blowing at White Bear, not enough to make the men hang out to windward, but sufficient to cause an interesting race. The eight knot course, twice to Wildwood, was chosen by the committee for all the boats. They were sailed in four classes, the two new syndicate boats, the two old A boats, the new Bs. and the old Bs.

The syndicate boats Alpha, designed by Mower, and Beta, by Crowninshield, had been having several small trials, but this was their first real race. The former is being sailed by L. P. Ordway, the latter by C. M. Griggs. From the start Beta got the better, and gradually gained until the finish, over 7m. in the lead. Of the As, Seeress, manned by Evan Rees, was the first to cross the line, and gradually increased her lead until the run home from Wildwood. Then Moccasin passed her, and rounded the Dellwood buoy several seconds ahead. On the second half of the course, however, Seeress quickly overtook her opponent and finished a victor by 6 1/2 m.

The new Bs. started off in a bunch. At the center buoy Damfino, sailed by Dr. Owens, was in the lead, followed by Flycamaroo and Wanderer, sailed by Donald Taylor and Sam Ordway respectively. At Wildwood they were in the same order, but on the return to center Damfino did not set her spinnaker and was thus overtaken by Flycamaroo and Wanderer. The latter was the first to round the center buoy, and the race was finished in this order, Wanderer slightly increasing her lead. In the fourth class—the old Bs—Pluto, the White Bear champion of last year, was an easy victor.

During the following week the Alpha and Beta had several races. At first Beta had a little the better, for her sail was flatter and in a better condition. Therefore, it was decided to exchange the sails and try the two boats. When this was done, Alpha beat by a larger margin than her opponent had previously done. So far, however, it is difficult to tell which of the two boats is the better. Beta seems to make a slightly better showing off the wind, while Alpha will probably prove faster to windward with large waves. When Alpha had her baggy sail she had a race with the Seeress. Although Seeress won to windward, Alpha more than made up the distance off the wind.

Thursday, June 16.

On Thursday, June 16 the Minnetonka boat, Wihnja, arrived, and a firm, dable boat she appears to be in a heavy wind. She is a large scow with a considerable amount of freeboard and has her centerboard at a very great slant and pointed slightly inward. This boat was designed and built by Peterson, of Minnetonka, and is owned and sailed by the London Brothers.

Friday, June 17.

On Friday Beta, Gama and Wihnja sailed, in a good full sail breeze. Gama, designed and sailed by Dr. Welch, of St. Paul, put in a reef, and was badly beaten by Wihnja. Beta and Wihnja were about even.

Saturday, June 18.

The regular Saturday race, June 18, was especially interesting, on account of the fact that four new A boats participated—Alpha, Beta, Gama and Wihnja. There was a nice little S.E. wind blowing, only strong enough, however, for the six knot course—to Wildwood and return, then to center and return.

The first boats to start were the old As, Seeress and Moccasin. Seeress crossed the line first and gradually gained, winning at every turn, until the finish, when she was over 5m. in the lead.

The new A boats started close together in the following order: Alpha, Beta, Gama and Wihnja. The first leg was to windward, and Wihnja gradually gained until she had passed her three opponents. She was the first to round the center buoy, followed by Alpha, Beta and Gama. At Wildwood the boats were in the same position, Wihnja having a lead of 23s. She maintained this lead until the last leg, when Alpha overtook her and won by 48s. Beta finished third, a few seconds ahead of Gama.

The new Bs, eight in number, started at 3:30. At the end of the first leg Wanderer was leading, followed by Circe, Damfino, Robin Hood, Rambler, Flycamaroo, Young America and Wraith. On the next two legs few changes occurred, except that Rambler gained third position, and Wanderer increased her lead. On the last run home, Damfino caught and overtook Rambler and Circe, gaining second place. The following is the official time of the races, and the names of the skippers:

New A Boats.		
Alpha, L. P. Ordway.....	1 22 43	1 22 43
Wihnja, James London.....	1 23 27	1 23 27
Beta, C. M. Griggs.....	1 26 34	1 26 34
Gamma, Dr. Welch.....	1 26 50	1 26 50
Old A Boats.		
Seeress, Evan Rees.....	1 20 37	1 20 37
Moccasin, Clarence Fry.....	1 26 25	1 26 25
Class B (New) Boats.		
Wanderer, Jack Ordway.....	1 29 08	1 29 08
Damfino, Dr. Owens.....	1 33 14	1 33 14
Circe, Theo. Schulze.....	1 33 15	1 33 15
Rambler, William Skinner.....	1 34 36	1 34 36
Flycamaroo, Donald Taylor.....	1 34 45	1 34 45
Robin Hood, T. B. Murray.....	1 44 47	1 44 47
Young America, H. Pinska.....	1 48 52	1 48 52
Wraith, Fred Reid.....	1 53 19	1 53 19

In the trial races, soon to commence, the A boats, both old and new, will take part. There will be two races each day, the boats sailing in pairs, and the winners racing off.

The open regatta of the Pewaukee Y. C. was held on the 18th in a fair easterly wind. Allumac led at the start, with Dora, Elk, Mercury and Comet following closely, while the Defender, through an error, lost over a minute in crossing. On the first leg Allumac held her position, but was outfooted to windward by the Comet. The latter won the race while Defender was second and Dora third.

SAM G. ORDWAY.

Southern Y. C.

Lake Pontchartrain, New Orleans, La., June 18.

This day was a cup race event, a very popular mid-June annual fixture in the schedule of the Southern Y. C. The prizes contested for were the Baldwin cup for one-design cabin sloops, the Foster cup for one-design knockabouts and the Walker cup for all open sloops. This mixing of the big and little fellows of a division is not without its interesting side, as an opportunity is given to determine just how the give and take of the time allowance scale operates when stretched much farther than the generally accepted economic limits. The little fellows rarely have a chance to win no matter how big a bunch of allowance may be their portion.

The wind was very light at the start at 1:30 P. M., and for the greater part of the afternoon, not over five knots, increasing toward evening to eight knots. The course was ten miles, over the regular club triangle of five miles, twice around. Calypso, the Boston 25ft. waterline cabin sloop, sailing her second race in the south, was the center of attraction. She was sailing under much better circumstances than when she lost her first race, her condition being improved and her new owner having the sloop well in hand. The Burgess & Packard designed Ireak, Invader, was a sorry disappointment, it being a mystery how a boat with such a large spread of cloth could lag so far behind while being headed in the right direction, even if she was not particularly well handled. In this class Nydia and Agnes split tacks with the rest and went off hunting a fluke. They practically never got back, for they lost nearly a whole stake on the move. The old-timer Susie B was well sailed and she and the Calypso made an interesting contest of it for a time. Susie, with her large club topsail, finally got rather the best of a nip-and-tuck drifting match with the northern jib and mainsail sloop, and she was leading by a hundred yards and more when an eight to ten knot breeze sprung up for the finish of the course. Calypso immediately picked up her heels, and there was thereafter nothing on the course but the Hanley production. This gave southern yachtsmen their first chance to observe what an up-to-date, long-ended craft with great reserve power can do when the breeze is looking up a bit. Susie, in the increasing breeze, not only took down her topsail and outer jib, but tucked in a reef as well, while the harder it blew the faster and the better went Calypso.

In the one-design class of knockabouts of Mower design, the Sinner won handsily, she being most cleverly handled. For the Walker cup the only starters were the two Inland Lake Association importations, Kayoshk and Virgin, ex-Caroline. In the fluky drifting match on the first leg of the course, the former lost out and was never quite able to get to the front, although she did some phenomenal sailing up from the rear when she got her breeze. Kayoshk in one of the latest production of Jones & Laborde.

There was much regret that the Boston 25-footers Chewink III. did not get here for the Baldwin cup race, but she was delayed by the alterations to her bow, which had to be made so that she could measure in under the "45 per cent." rule of the southern clubs. The day she was expected to arrive here from New York she had not yet left Boston. Boats of the Calypso and Chewink size are growing popular here, and several others are being negotiated for by members of the Southern Y. C. The summary of the three cup races:

Baldwin Cup.		
Calypso, S. F. Heaslip.....	3 55 34	3 54 05
Susie B, A. M. Cooke & Co.....	4 13 48	4 13 48
Nydia, J. A. Rawlins.....	4 13 40	4 13 06
Invader, Palestine & Viguier.....	4 26 45	4 24 01
Agnes, Conrad & Co.....	4 34 00	4 34 00

Walker Cup.		
Virgin, U. J. Virgin.....	4 08 09	4 09 42
Kayoshk, Campbell Syndicate.....	4 09 32	4 09 32
Foster Cup.		
Sinner, Wuescher, Johnson & Co.....	4 15 14	4 15 14
Siren, Gore, Emmette & Co.....	4 33 30	4 33 30
Juanita, Prochaska & Cottman.....	4 54 25	4 54 25

L. D. SAMPSELL.

Beverly Y. C.

Buzzards' Bay, Mass.—Saturday, June 25.

In a reefing breeze from the S.W., a club race of the Beverly Y. C. was sailed in Buzzards' Bay on Saturday, June 25. In the 30ft. class Young Miss was the only starter, and she took a walkover. In the 21-footers Terrapin beat out the new Herreshoff boat, Illusion, on every point of sailing. In the new 18ft. class there were three starters, Jap winning by 46s. Ranso won easily in the 15ft. class. The summary:

30-Footers.		
Young Miss, D. L. Whittemore.....	1 48 20	1 48 20
21-Footers.		
Terrapin, L. S. Dabney.....	1 56 05	1 56 05
Illusion, C. M. Baker.....	2 01 00	2 01 00
18-Footers.		
Jap, George F. Gardiner, Jr.....	1 26 04	1 26 04
Hindoo, N. F. Emmons.....	1 26 30	1 26 30
Wizard, F. W. Sargent.....	1 31 00	1 31 00
15-Footers.		
Ranso, M. H. Richardson, Jr.....	1 09 51	1 09 51

Bristol Y. C.

Narragansett Bay, R. I.—Saturday, June 25.

The first open regatta of the Bristol Y. C. was sailed June 25, in a stiff southwester and a lumpy sea, that made out and out good racing in several classes. There were twenty-six starters, and twenty of them finished the course. Seldom has a better race been seen in Narragansett Bay than that put up by C. F. Tillinghast's Little Rhody, and the Priscilla, owned by W. S. Wood, of Fall River. It was a close scrap from start to finish, with much shrewd work on the part of both skippers, and the Priscilla crossed the line only two seconds ahead of Little Rhody, the latter winning on corrected time.

Another close race was between two 21ft. knockabouts, Eaglet and Oriana, in which Eaglet, sailed by a Providence girl, Miss Grosvenor, won by 5s., which was made nearly 3m. in corrected time.

The 30ft. cat Elizabeth won another first in her class, beating the Scott by nearly 5m. In the small launch class, N. G. Herreshoff, Jr.'s Neon repeated her performance at the Rhode Island Y. C. the week before and walked away from her rivals with nearly 11m. to spare.

Every yacht in the race carried a distinctive mark in the new racing pennant of the N. B. Y. R. A., flown from the main peak. The regatta committee consisted of Edward H. Tingey, Wallis E. Howe and Walter S. Almy. The winners were Little Rhody, Micaboo, Eaglet, Finnan Haddie, Elizabeth, Ina, Bother, Firefly and Neon.

The course for the larger boats was 11 nautical miles, for the smaller sailing craft 9 1/2 miles, and for the launches 4 1/4 miles. The summary:

30ft. Sloops—Start, 1:43.		
Little Rhody, C. F. Tillinghast.....	2 01 07	1 59 17
Priscilla, W. S. Wood.....	2 01 05	2 00 43
Ethelka, A. M. Reid.....	2 06 09	2 06 09
25ft. Sloops—Start, 1:46.		
Micaboo, W. R. Tillinghast.....	2 05 50	2 05 50
21ft. Sloops—Start, 1:49.		
Eaglet, Miss Grosvenor.....	2 12 24	2 09 13
Oriana, F. Pardee.....	2 12 29	2 12 06
Special Rig Class—Start, 1:55.		
Hayka, F. Harris.....	Did not finish.	Did not finish.
Tigress, H. Brasso.....	Did not finish.	Did not finish.
Finnan Haddie, P. De Wolf.....	3 39 30	3 39 30

F. H. YOUNG.

Bayside Y. C.

Bayside, L. I.—Saturday, June 18.

The Bayside Y. C. held its first regatta on Saturday, June 18. There were eleven starters, and the race would have been a great success had it not been for the lightness of the breeze. The boats were to have sailed twice over a five mile course, but the race was stopped at the end of the first round.

The sloops were sent away at 2:35, and Ruby was the first to finish; first prize goes to Little Peter, however, as Ruby allows her 7m. time. Emma J. was the only one of the three starters in the catboat class to finish. Emma J. made the best time over the course.

In the one-design dory class Bunnie finished a winner. Seaweed was the only other boat to finish in this class, and she crossed the line ten minutes after Bunnie. The regatta committee consisted of C. S. Willis, Duncan Curry and J. Thomas Beck. The summaries:

Sloops—Start, 2:35.		
Ruby, Charles G. Myers.....	5 34 30	2 59 30
Little Peter, H. G. Weeks.....	5 32 10	2 57 10
Wonder, H. R. Stedick.....	5 35 00	3 00 00
Catboats—Start, 2:40.		
Emma J., G. Waldo Smith.....	5 30 00	2 50 00
Lacy, Lacy Dayton.....	Did not finish.	Did not finish.
Now Then, Todd Robbins.....	Did not finish.	Did not finish.
Dories—Start, 2:50.		
Bunnie, Leo Budd.....	4 26 00	2 33 00
Seaweed, J. P. Parett.....	4 36 00	2 46 00
Fore, James Cullin.....	Did not finish.	Did not finish.
Anowan III., J. D. Hill.....	Did not finish.	Did not finish.
Mystery, J. H. Lee.....	Did not finish.	Did not finish.

Riverton Y. C.

Riverton, N. J.—Saturday, June 18.

The second race of the Riverton Y. C. was sailed in a light and fluky breeze on Saturday, June 18. The cats and one-design boats covered a twelve mile course, and the mosquito boats and larks went nine miles. The summary:

Catboats—Start, 3:12.

Eastern Y. C.

Annual Regatta.

The annual regatta of the Eastern Y. C. will be sailed from Halfway Rock, off Marblehead, on Friday, July 15, at 11 A. M., unless unfavorable weather should necessitate postponement.

All matters connected with the regatta, unless otherwise specified, will be governed by the racing rules of the Eastern Y. C. Entries—Entries must be received in writing by the regatta committee at the club house, before 8 A. M. of the morning of the race, and must state the rig and ownership of the yacht, with its measurement under Eastern Y. C. rules. The committee may accept post entries, in its discretion.

The measurer of the club is Mr. Henry Taggard, 50 State street, Boston, Mass.

Each yacht must carry a racing number on each side of the mainsail, as near the center of the sail as is possible; yachts without numbers will be supplied by the committee on application at the club house.

Classes—Schooners.

- Class A—Over 90ft. rating measurement.
- Class B—Not over 90ft. and over 75ft. rating measurement.
- Class C—Not over 75ft. and over 64ft. rating measurement.
- Class D—Not over 64ft. and over 55ft. rating measurement.
- Class E—Not over 55ft. rating measurement.

Single-Masted Vessels and Yawls.

- Class F—Over 100ft. rating measurement.
- Class G—Not over 100ft. and over 82ft. rating measurement.
- Class H—Not over 82ft. and over 68ft. rating measurement.
- Class I—Not over 68ft. and over 57ft. rating measurement.
- Class J—Not over 57ft. and over 48ft. rating measurement.
- Class K—Not over 48ft. and over 40ft. rating measurement.
- Class L—Not over 40ft. rating measurement.

Prizes.—In each class there will be a prize for first if two or more yachts start in the class; a prize for second if four or more yachts start; and a prize for third if seven or more yachts start. The prizes will be silver. The Puritan cup will be awarded for the year to the yacht of the Eastern Y. C. making the best corrected time, on regular Eastern Y. C. allowances, over the course sailed by the larger yachts.

Cruising Trim—All yachts shall race in cruising trim; but no yacht under 40ft. waterline length need carry a boat.

Measurement and Allowances.—Special attention is called to the new rules for measurement and allowances.

Courses.—The starting line and finish line will be between a white flag on the committee steamer and a flag buoy anchored off Halfway Rock; in all starts leave the flag buoy on port, and at finish leave it on starboard.

The Eastern Y. C. turning buoy is a white 50ft. iron spar buoy with a white top, bearing a small black cage, placed 6 miles S.E. ½ S. from Halfway Rock.

One of the following courses, to be designated by a code flag to be hoisted on the committee steamer at 11 A. M. The lower flag will designate the course for D and E classes of schooners, and J, K and L classes of single-masted vessels and yawls; the upper flag for all other yachts.

C—From starting line to and around the turning buoy, leaving it on starboard; thence to and around Graves Whistling Buoy, leaving it on starboard; thence again to the turning buoy, leaving it on port; thence to the finish line. Allowance, 30½ miles.

D—From starting line, to and around the turning buoy, leaving it on starboard; thence to and around Boston Lightship, leaving it on starboard; thence again to the turning buoy, leaving it on port; thence to the finish line. Allowance, 26½ miles.

E—From starting line to and around the turning buoy, leaving it on port; thence to and around Eastern Point Whistling Buoy, leaving it on starboard; thence again to the turning buoy, leaving it on starboard; thence to the finish line. Allowance, 28 miles.

F—From starting line, to and around the turning buoy, leaving it on port; thence to and around Cape Ann Whistling Buoy, leaving it on starboard; thence again to the turning buoy, leaving it on starboard; thence to the finish line. Allowance, 38½ miles.

H—From starting line to and around Boston Lightship, leaving it on port; thence to and around the turning buoy, leaving it on starboard; thence again to and around Boston Lightship, leaving it on starboard; thence to the finish line. Allowance, 33½ miles.

Courses for D and E classes of schooners and J, K and L classes of single-masted vessels and yawls:

I—From starting line, to and around the turning buoy, leaving it on starboard; thence to and around Graves Whistling Buoy, leaving it on starboard; thence to the finish line. Allowance 23½ miles.

K—From starting line to and around Graves Whistling buoy, leaving it on port; thence to the finish line. Allowance, 23½ miles.

S—From starting line to and around the turning buoy, leaving it on starboard; thence to and around Boston Lightship, leaving it on starboard; thence to the finish line. Allowance 22½ miles.

T—From starting line to and around Boston Lightship, leaving it on port; thence to and around the turning buoy, leaving it on port; thence to the finish line. Allowance, 22½ miles.

V—From starting line to and around the turning buoy, leaving it on port; thence to and around Eastern Point Whistling Buoy, leaving it on port; thence leaving Kettle Island and S. E. Breaker Buoy on starboard, to the finish line. Allowance 20½ miles.

W—From starting line, leaving S. E. Breaker Buoy and Kettle Island on port, to and around Eastern Point Whistling Buoy, leaving it on starboard; thence to and around the turning buoy, leaving it on starboard; thence to the finish line. Allowance 20½ miles.

Diagrams of all the courses may be obtained at the club house. Signals.—If the first signal is delayed, the intervals will remain unchanged.

The official time may be had from the chronometer at the club house on the day of the race until 8:30 A. M.

Prior to all signals, the course letters, as above, will be hoisted on the committee steamer and will fly until all classes have started, except that if the committee decides to postpone the start, the letters will be lowered and code signal J hoisted, to cancel all previous signals.

At 11, preparatory, a gun will be fired or whistle blown, the club burgee lowered, and the blue peter set.

Five minutes after preparatory, warning, with gun or whistle, the blue peter will be lowered.

Ten minutes after preparatory, with gun or whistle, a red ball will be hoisted for the start of Classes A, B, F and G.

Fifteen minutes after preparatory, with gun or whistle, a second red ball will be hoisted for the start of Classes C, D, H and I.

Twenty minutes after preparatory, with gun or whistle, a third red ball will be hoisted for the start of Classes E, J, K and L.

Each division will be allowed two minutes for crossing the line. Code flag M will indicate "Race is declared off."

Henry Howard, Chairman, George Atkinson, Jr., Stephen W. Sleeper, Louis M. Clark, secretary, 50 Congress street, Boston, Regatta Committee E. Y. C.

Ocean Race.

The above programme of the annual regatta of the Eastern Y. C. is of importance to owners of yachts having already entered, or intending to enter the ocean race of the same club from New York to Marblehead, as all yachts sailing in the ocean race are invited to compete in the annual regatta.

It is the desire of the committee to announce once more that all entries for the ocean race must be received by the regatta committee at the Eastern Y. C., Marblehead, Mass., or by H. A. Morss, 110 State street, Boston, before 10 A. M., Friday, July 1, and must state the rig and ownership of the yacht with its measurement under Eastern or New York Y. C. rules. The committee may accept post entries in its discretion.

The regatta committee of the Eastern Y. C. has sent the following instructions to the officer in command of Nantucket Shoals Light Vessel for reporting the Eastern Y. C. ocean race:

This race will start from Sandy Hook, N. Y., on Wednesday, July 6, at 3 P. M. Under the most favorable conditions you may look for a speed of 12 knots for the largest boats; that is, except under exceptional conditions, you would not expect to see even the largest yachts pass your lightship before 7 A. M., Thursday, July 7; but the first arrival will probably be much later.

Immediately after the race has begun, we will telegraph you the number of yachts that have started, so that you will know when they have all passed.

You will take the number and time of each yacht as she rounds your light vessel and report the same by wireless at once to the Eastern Y. C., Marblehead, Mass.

You will also verify the wireless reports by a written report, to be sent to us at the earliest opportunity. If you obtain the name, as well as the number of a yacht, include this both in your wireless and written report.

Each yacht will carry her number on her mainsail; this may be seen during daylight. At night numbers will be shown by a system of night signals.

Each yacht will first show a Coston light, which will burn for about 45 seconds.

After this she will show successively two Roman candles, each having the same number of balls.

Then follows a complete table of night signals, providing numbers for eighty-eight yachts. The signals are ingeniously arranged by changing the colors of the Coston lights, and of the balls in the Roman candles, as the numbers go up. The instructions continue:

If a night signal is perfectly understood—that is, if you have counted the same number of balls from each of the two Roman candles—you will immediately answer by showing a white Coston light. If you do not make out the number, do not give the answering signal, and the number will be repeated by the yacht until you do answer.

We are sending you six dozen Coston lights and one holder, to be used by you in answering the above signals.

Do not hesitate to telegraph us at our expense if you require any additional information. We are also sending a copy of the A, B, C code which you may find of use if it is necessary to communicate with us, and which we will use if we find it necessary to communicate with you.

The work done by you will be of vital importance to the success of the race, as no yacht will be awarded a prize unless she has been reported by you as rounding your light vessel. By rounding we mean that each yacht must pass to the southward and eastward of your lightship.

New York Y. C.

Glen Cove, Long Island Sound—Tuesday, June 21.

The races for the Glen Cove cups were sailed on Tuesday, June 21, under the auspices of the New York Y. C. There were fewer starters in this event than there was in the New York Y. C.'s annual regatta on the Lower Bay. Neola, Weetamoe and Isolde were the starters in the cutter class, while Emerald and Katrina were the contestants in the schooner class. It was a most perfect day for the race, as a fresh W.S.W. breeze held true throughout the contest.

The start was made off Glen Cove. The first leg was N.E., ten miles to and around a mark near Stamford Light; the second leg was W.S.W. seven and a half miles to and around a mark off Parsonage Point; thence S. ½ W., four miles to the finish line, a distance of twenty-one and a half miles. The first leg was a run, the second a beat and the third a close reach. The tide was running flood.

The regatta committee, S. Nicholson Kane, Newbury D. Lawton and Oliver Cromwell, were on board Mr. J. L. B. Mott's fine steam yacht Candia.

The preparatory signal was given at 1 o'clock. The cutters were sent away at 1:15. Neola crossed a few seconds after the gun, with Weetamoe close behind. Isolde went over a minute later. Balloon jib topsails and spinnakers were broken out on all three boats. Emerald beat Katrina over the line. The boats were timed at the start as follows:

Neola	1 15 13	Emerald	1 21 17
Weetamoe	1 15 14	Katrina	1 22 50
Isolde	1 16 10		

The 36ft. sloop Spasm started, but withdrew at once, as Cymbra, the boat she was to have raced against, did not put in an appearance. The boats made good time on the run to the first mark. Neola pulled away from Weetamoe a little, and both these boats made gains on Isolde. Katrina has been fitted with an entire new suit of canvas, which sets well and accounted, in a measure, for the excellent showing she made.

At the first mark the boats were timed as follows:

Neola	2 28 37	Emerald	2 34 35
Weetamoe	2 29 15	Katrina	2 39 07
Isolde	2 36 07		

After rounding all stood off on the port tack. Weetamoe was the first to tack to starboard, and was soon followed by Neola. Isolde held her port tack some time longer. Neola had set her jib topsail soon after rounding, and Weetamoe, finding she was losing ground, did likewise. Isolde was doing so well under the Connecticut shore on the port tack that Katrina followed suit. The times at the second mark were:

Neola	3 43 19	Emerald	3 53 05
Weetamoe	3 44 52	Katrina	3 59 10
Isolde	3 51 22		

The wind had worked to the S.W., and it was a close reach to the finish line. The times taken at the finish follow:

Neola	4 07 10	Emerald	4 19 46
Weetamoe	4 07 54	Katrina	4 26 20
Isolde	4 16 04		

The summary:

	Schooners.		El'ps'd.	Corr't'd.
	Start.	Finish.		
Emerald, W. E. Iselin	1 21 17	4 19 46	2 58 29	2 58 29
Katrina, J. B. Ford	1 22 50	4 26 20	3 03 30	2 49 11

	Sloops.		El'ps'd.	Corr't'd.
	Start.	Finish.		
Neola, G. M. Pynchon	1 15 13	4 07 10	2 51 57	2 51 17
Weetamoe, H. F. Lippitt	1 15 14	4 07 54	2 52 40	2 52 16
Isolde, F. M. Hoyt	1 16 10	4 16 04	2 59 54	2 51 43

Emerald allowed Katrina 14m. 19s. Katrina wins by 9m. 18s. corrected time. Neola allowed Isolde 8m. 11s. Isolde wins by 14s.

Old Mill Y. C.

Jamaica Bay, L. I.—Sunday, June 19.

Twenty boats started in the club regatta of the Old Mill Y. C., sailed on Sunday, June 19. There was a good sailing breeze from the S., and the boats covered a triangular course. The first leg was a beat, the second a close reach and the third a run.

The catboat Diana, the launch Pet and the sloop Viola were alone in the respective class, none of their competitors starting. The winners were Pauline B., Amaranth, Naomi, Ben Hur and Free. The summary:

	Cabin Cats—Class F—Start, 12:25:40.		El'ps'd.	Corr't'd.
	Start.	Finish.		
Diana	1 44 29	1 44 29	1 19 49	

	Open Cats—Class G—Start, 12:32:40.		El'ps'd.	Corr't'd.
	Start.	Finish.

New York A. C. Cruising Race.

New Rochelle to Block Island—Start, Saturday, June 25.

The boats which started in the race from New Rochelle to Block Island, on Saturday, June 25, finished early Sunday morning, the winner crossing the line at 2:10 A. M., making the run of 115 knots in sixteen hours. The race, which was the first of the long races scheduled for the season, was most interesting; and, although only six started, all finished in good time, considering the length of the course and the various types of boats entered. The New York Athletic Club, under whose auspices the race was given, added a yachting department to the club's attractions some years ago, but this is the first race it has ever held, and its success is due to the energy of its chairman, Mr. W. Rathborne.

The starters, which consisted of the sloops Possum, Saladin, Hanley and Penekese, and the yawls Escape and Adelaide, started from an imaginary line off Huckleberry Island, New Rochelle, at 10 o'clock on Saturday with a light westerly breeze, and kept well bunched until off Oyster Bay, when the wind veered to the southward. With the wind abeam, Possum and Hanley drew ahead and held their lead to the finish. The race between the other boats was very close all day, and the second

division had an even more exciting time of it. Saladin, Escape and Adelaide kept well together, with Escape always slightly in the lead. About 3 o'clock, when off Port Jefferson, the wind hauled more to the westward and came out strong, and the little boats with spinnakers and balloons set were tearing along in a smother of foam.

The wind held strong until off Orient, when it dropped almost to a calm, but the boats slipped through the Gut on the ebb tide about 10 P. M., within a few minutes of each other. From there until well east of Gardiner's Island, the wind came from all points of the compass, and a heavy easterly roll bothered the boats considerably. Toward morning the wind freshened again, and the time of finishing was as follows. Start, 10:10:

	Finish.	Elapsed.
Possum	2 10 00	16 00 00
Hanley	2 25 00	16 15 00
Adelaide	4 00 00	17 50 00
Saladin	4 15 00	18 05 00
Escape	5 15 00	19 05 00
Penekese	5 30 00	19 20 00

As each boat took its own time, these figures, while very close, are not exact.

JAMES D. SPARKMAN.

British Letter.

In discussing the suitability of Kariad as a defender of the Cape May cup against the challenge of Ingomar, I had overlooked the fact that, according to the conditions which govern the race, the defending yacht must be that vessel which last won it. The Cape May cup has not been sailed for since 1893, when our present King—who was then Prince of Wales—successfully defended the trophy against Mr. Royal Phelps Carroll's Navahoe with his cutter Britannia. The famous old Watson cutter has finished her racing career many seasons ago, and has had her spars and canvas considerably reduced, so that it is out of the question to look to her to defend the cup. In default, therefore, it will go to Ingomar. The absurdity of a condition which binds the last winner of the cup to defend it when called upon—no matter how many years may have elapsed—will, it is to be hoped, cause a revision of the rules by the New York Y. C., if that body has the power to do so. Of course, it may be stated that, had the owner of any suitable British yacht been desirous of defending the cup, he could have sent in his challenge to the Royal Yacht Squadron, and if Britannia was not forthcoming, the cup would have been handed over to him by default, in which case Ingomar might have been given a run for her money. That is no doubt so, but it is more than probable that the conditions of the race have been forgotten by most people, as it is so long since the cup was in contest, and the awakening to the actual state of affairs has been a complete surprise to everybody. It is a matter for regret that Mr. Plant will not have anything to try his vessel against, for the course from the Needles round Cherbourg breakwater and back is a fine one for two-stickers, and it would anyhow have been a race. As it is, if Mr. Plant exercises his right to claim the cup in the absence of a defender, it will revert to the New York Y. C., who, with Mr. Plant, will regret as much as ourselves that the trophy should have gone back as the result of a bloodless victory.

The handicap class has this year lost two old favorites. One is Maid Marion, which is not fitted out, but has been replaced by White Heather; the other is the well-known yawl Namara. The latter vessel has recently passed under the French flag, she having become the property of the Marquis Gicquel des Touches. The absence of Maid Marion can scarcely be regretted, as she has been replaced by a larger and finer vessel, but Namara's defection is a loss which will be severely felt, as she was peculiarly the most desirable type of boat as a cruiser racer. Above water she was not a beauty by reason of her excessively high bulwarks; in fact, she was one of the least sightly vessels Watson ever turned out. She had a beautiful bottom, however, and possessed the true and proper characteristics of the ideal fast cruiser—speed, weatherliness, dryness, and comfort. She was built in 1894 for Mr. W. B. Paget, the present commodore of the Royal Victoria Y. C., and was raced by him for many years in the handicap class; both as a cutter and yawl, with considerable success. Her last owner was Mr. Douglas Eckford, who raced her last season, winning, among other trophies, the Albert cup at the regatta of the Royal Albert Y. C., Southsea. Namara sailed two very fine races on the two days of the Royal Albert regatta. A fresh wind prevailed on each day, and she showed conclusively that she was quite as fast as the Fife yawl Valdora, which was then in her first season, while Namara was in her tenth. Both boats are about the same size, any difference being in favor of the new boat. The fact is Namara is one of those wonderful vessels which keep their speed up year after year, of which Watson has turned out many in his time, and may be termed one of Watson's evergreens. She will be a great loss to us, and a great gain to the French cruising fleet.

E. H. KELLY.

Rhode Island Letter.

PROVIDENCE, R. I., June 25.—The Herreshoff shops at Bristol are about as dull now as they were last winter, when all hands were put on short time. The completion of the sloop Margaret the past week left work in the carpenter department very slack, and a number of hands have been laid off, including some mechanics who have been employed at the Herreshoffs for a dozen years or more. Enough mechanics are retained to carry on the repairs incident to summer work, but there is practically nothing doing in the building of new craft. Besides the laying off of some of the employees, the working week has been shortened by one day, making a week of 45 hours instead of 54 hours.

A fine new cruising and racing sloop was launched at the Herreshoff yard this week for Mr. Henry T. Sloane, of the New York Y. C. She is named the Margaret, and is 39ft. on the waterline, and has moderate overhangs. She has a commodious cabin and a large cockpit. The trim is mahogany throughout. The Margaret is a keel boat, with a pole mast, and her lines are similar to those of Cock Robin, launched at Herreshoffs a month ago for racing at Marblehead, Mass. On her trial spin Wednesday, Margaret proved to be a lively boat, especially fast on the wind and quick in stays. The sloop was inspected by her owner, who came on from New York with a party of friends on his auxiliary schooner Idler. The Idler draws about 14ft., and she ran on a shelving rock in Bristol harbor Friday morning, hung up by the stern

until the tide served early in the afternoon, when she slid off without sustaining any damage.

The new 30ft. racing and cruising cat, Wanderer III., owned by Messrs. Harvey J. and Dutee W. Flint, of the Edgewood Y. C., was launched at the Davis Bros.' shop at Warren, Friday, and was immediately rigged and put into trim for the season. She is a handsome craft, and has aroused considerable admiring comment among local yachtsmen. By next Saturday, when the first race of the season's series for the 30-footers for the Possner cup will be sailed at the Edgewood Y. C., she will probably be sufficiently tuned up to make a satisfactory showing.

A new proposition is being discussed by several of the owners of 30-footers, an ocean race for the class, to be sailed from the Edgewood club house to and around Block Island and return, a distance of 110 or 115 miles. The island lies 10 miles offshore, but is about 20 miles from Newport, so a race of this kind would give something over 50 miles of outside work, with about 60 miles of sailing in Narragansett Bay. It is thought that this would provide an excellent test of the all-round qualities of the big cats, and the race will probably be arranged in the near future, the start to be made some time near midnight on a Saturday night, in order that the outside work may be met by daylight. Two large and handsome silver cups have been reserved for prizes in case the race is arranged.

Fleet Captain Barlow, of the Rhode Island Y. C., has received a letter from Commodore Little, of the Shelter Island Y. C., with reference to the visit of the local fleet to that port during the annual cruise. The Sachem's Head fleet will also be at Shelter Island at that time, and an inter-club race has been arranged for the visitors by the Shelter Island Y. C. for July 27. On the following day the Sachem's Head fleet will accompany the Rhode Island fleet to Block Island, the run to be an interclub race, with a special club prize, in addition to the prizes for the winning boat in each class.

The speed launch Moyea, owned by Mr. L. O. Meacham, of Chicago, which has just been converted into a typical auto boat at F. S. Nock's shop at East Greenwich, where she was built last year, is ready to leave for her owner's summer home at Westbrook, Conn. She is to be used in coaching the Yale junior crew on the Thames next week by Mr. Meacham. Moyea now has a 15 horse-power Buffalo motor, and has developed a speed of 15.7 miles an hour.

Two Rhode Island Y. C. sloops—C. F. Tillinghast's Little Rhody and E. K. Hill's Eumarlia—are preparing for the Brooklyn Y. C. ocean race from New York to Marblehead next Saturday.

F. H. YOUNG.

YACHTING NEWS NOTES.

For advertising relating to this department see pages ii and iii.

ISLAND HEIGHTS Y. C. SCHEDULE.—The regatta committee of the Island Heights (N. J.) Y. C. have arranged for the following races:

Saturday, July 2—Race for one-design class.
Monday, July 4—Race for the Mrs. Webb championship cup. Limited to boats enrolled in the I. H. Y. C., of racing length, under 20ft., the minimum classification to be 18ft. Corinthian crews. Entrance fee, \$1.
Saturday, July 9—Cruise down the Bay and dinner at Forked River.

Tuesday, July 12—Mixed club race. For sailboats of any description not over 20ft. racing length. Racing length to be obtained by adding the length over all and length of waterline and dividing by two. Entrance fee, 25 cents.

Thursday, July 14—Race for the ladies' championship cup. Limited to Barnegat sneak boxes, not over 18ft. over all; no time allowance. To be sailed and handled by lady members of the I. H. Y. C. only.

Saturday, July 16—The J. Willard Morgan cup race. Over a course on Barnegat Bay and Toms River. Open to catboats of Bay Head, Mantoloking, Seaside Park, and Island Heights Yacht Clubs. Boats to be not less than 20ft. nor more than 26ft. racing length. Corinthian crews. Number of boats limited to five from each club. Competing boats to be selected by the regatta committee.

Tuesday, July 19—Mixed club race.
Thursday, July 21—Race for the ladies' championship cup.

Saturday, July 23—Open sneak-box race. Open to sneak-boxes 20ft. and under over all measurement.

Tuesday, July 26—Mixed club race.
Thursday, July 28—Race for the ladies' championship cup.

Saturday, July 30—Annual open race. Open to yachts in any yacht club over 18ft. racing length. Racing length to be obtained by adding the length of waterline and length over all, and dividing by two. Entrance fee, \$2.

Tuesday, August 2—Mixed club race.
Thursday, August 4—Race for the ladies' championship cup.

Friday, Saturday and Sunday, August 5, 6, and 7—Annual cruise. Touching Beach Haven and Tuckerton.

Tuesday, August 9—Mixed club race.
Thursday, August 11—Race for ladies' championship cup.

Saturday, August 13—Sewell cup race, over Seaside Park Y. C. course. Boats to be cat-rigged, not less than 20ft. nor more than 26ft. racing length. Corinthian crews. Competing boats to be selected by the regatta committees.

Saturday, August 20—Race for one-design class.
Saturday, August 27—Cruise to Mantoloking and Bay Head. Bay Head open race, 1 P. M.

Saturday, September 3—Race for one-design class.
Monday, September 5, Labor Day—Annual race for club championship cup. Limited to yachts enrolled in I. H. Y. C. Racing length, 18ft. to 26ft. Corinthian crews. Entrance fee, \$1.

All races, unless otherwise mentioned, to be sailed over the courses of the Island Heights Y. C.
Measurer, T. Fernley Brooks; regatta committee—Thelwell R. Coggeshall, chairman; Edgar Freeman, Charles H. Stoutenburgh, Charles M. Pearce, Guy A. Luberg.

SEASIDE PARK Y. C.—The regatta committee of the

Seaside Park (N. J.) Y. C. have arranged the following racing programme:

July 2—Race for open yachts and dories.
July 4—Race for tuckahoes.
July 9—Race for cruisers and sneak-boxes.
July 16—Race for Morgan cup. Open to the yachts of Bay Head, Island Heights, and Seaside Park Yacht Clubs.
July 23—Race for open yachts and dories.
July 30—Race for cruisers and tuckahoes.

August 6—Race for ladies' cup. Open to yachts enrolled in the Seaside Park Y. C.

August 10—Race for Sewell cup. Open to yachts of the Bay Head, Island Heights and Seaside Park Y. C.

August 20—Race for open yachts and dories.

August 27—Race for power boats and sneak-boxes.

September 3—Open race for Corinthian yachts, clubs only.

September 10—Manhasset cup race. Open to yachts enrolled in the Seaside Park Y. C.

The winners of the dory class will be awarded the Johnson cup.

The races for mosquito craft will take place each Wednesday during the season.

Suitable prizes will be awarded in addition to the regular yacht club prizes. Championship pennants for each class.

THOMAS ALFRED VERNON DIES.—Thomas Alfred Vernon, Secretary of the Atlantic Y. C., died at his home in Brooklyn of paralysis on Thursday, June 23. Mr. Vernon had been closely identified with the affairs of the Atlantic Y. C.

INGOMAR WINS THE PRIZES AT KIEL.—The racing in the larger classes at Kiel began on June 24. The American schooner Ingomar won in her class, beating Meteor III; Iduna, Hamburg. Hamburg finished first, but won by 6m. on corrected time. Ingomar, beside winning the prize in her class, also won the Krupp memorial prize.

MARION PURCHASED BY SOUTHERN Y. C. MEMBERS.—Members of the Southern Y. C. have purchased during the past week the third sloop of last year's 25ft. restricted cabin class of the Y. R. A. of Massachusetts. Calypso is already racing in the South, Chewink III. is on the way there, and the latest purchase is the fine mahogany-planked sloop, Marion, sold by Dr. E. W. Gehan, of Boston, to Oscar Wilson and Oscar Geron, of New Orleans, La. Marion is a very fast boat, and she is also a splendid cruiser, having made several voyages to Nova Scotia and return. She is 38ft. long on deck, 25ft. waterline, 11ft. 6in. beam, and draws less than 3ft. of water. She will be sailed to New York and then taken South by the Morgan line.

SHELTER ISLAND Y. C. SCHEDULE.—The regatta committee of the Shelter Island Y. C. has arranged the following racing schedule:

July 4—Special regatta, club members.
July 9—Special regatta, club members.
July 23—Women's regatta.
July 27—Visit of Rhode Island Y. C.
July 30—Special regatta club members.
August 6—Annual open regatta.
August 13—Reception to yachswomen.
August 19 and 20—Annual cruise.
August 27—Special regatta, club members.
September 3—Special regatta, club members.

Cups have been offered in different classes by Commodore Geo. F. Little, Rear-Commodore G. Trowbridge Hollister, Vice-Commodore Arthur C. Whitney, William Schickel, D. P. Hathaway.

COMMODORE PECK'S APPOINTMENTS.—Commodore Peck, of the Sachem's Head Y. C., has made appointments to his staff as follows: Chaplain, Rev. Royal W. Raymond; Fleet Surgeon, Forbes Hawkes, M.D.; Flag Lieutenant, George B. Ward.

The regatta committee announces the following dates for club races:

Season Point Races—July 4, 18, and August 8, 15, and 22.

Ladies' Race—August 1.

Annual Regatta—September 5.

Annual Cruise—July 25, 31.

Club races will be started at 10 A. M.

Rifle Range and Gallery.

Fixtures.

June 26.—Zeltner's Morrisania Park.—German-American Shooting Society's shoot.

Cincinnati Rifle Association.

At our regular meeting on June 19, the following scores were shot at 200yds., offhand, 25-ring target. Most of our members were attending the national shoot at Union Hill, so our attendance was small. Mr. Odell, Sr., visited the range and shot a few scores; the first for some years. He says the fever always returns to a man who is fond of shooting.

Rifle Notes.

The daily press recounts that the Palma trophy has been shipped to the National Rifle Association of Great Britain by the National Rifle Association of America.

Trapshooting.

Fixtures.

July 1-2.—Brownwood, Tex.—West Texas Gun Club League tournament.
July 4.—Lawrence, Mass., Gun Club Independence Day tournament. Robert B. Parkhurst, Sec'y.
July 4.—Utica, N. Y.—Reverside Gun Club target tournament. E. J. Loughlin, Sec'y.
July 4.—Brunswick, Me., Gun Club all-day target tournament. G. M. Wheeler, Sec'y.
July 4.—Richmond, Va.—East End Gun Club annual merchandise shoot. J. A. Anderson, Sec'y.
July 4.—Pittsfield, Mass., Rod and Gun Club all-day shoot. Harold S. Sidway, Sec'y.
July 4.—Buffalo, N. Y.—Infallible Gun Club amateur tournament. Added money; merchandise prizes. F. J. Person, Sec'y.
July 4.—Lexington, Ky.—Ashland Gun Club tournament and Blue Grass championship. Robert R. Skinner, Mgr.
July 4-6.—Memphis, Tenn., Gun Club tournament; \$600 added money and trophies. A. H. Frank, Mgr.
July 4-6.—Winona, Minn.—The Interstate Association's tournament, under the auspices of the Winona Sportsmen's Club. Oswald Leicht, Sec'y.
July 6-7.—Homer, Ill.—Homer and Ogden Gun Clubs' tournament.
*July 6-7.—Kane, Pa., Rod and Gun Club.
July 8-9.—Wausau, Wis.—Wisconsin League of Gun Clubs' State tournament. H. G. McCrossen, Sec'y.
July 12-13.—Litchfield, Ill.—Consolidated Trapshooters' Congress.
July 12-14.—Denver, Colo.—Grand Western Handicap tournament.
July 12-14.—St. Paul, Minn., Rod and Gun Club amateur handicap tournament. J. L. D. Morrison, Sec'y-Mgr.
*July 13-14.—Scottsdale, Pa., Rod and Gun Club.
July 19-20.—Shamokin, Pa., Gun Club midsummer shoot. S. C. Yocum, Sec'y.
July 19-22.—Cincinnati, O., Gun Club annual handicap; \$2,200 added money and guarantee purses. A. B. Heyl, Sec'y.
July 20-21.—Armada, Mich.—Tournament of the Eastern Michigan Gun Club; \$100 added. E. W. Sutton, Sec'y.
July 27-28.—Grand Forks, N. D.—The Interstate Association's tournament, under the auspices of the Grand Forks Gun Club. W. M. Ferguson, Sec'y.
Aug. 9-10.—Litchfield, Ill.—Consolidated Trapshooters' Congress.
Aug. 9-10.—Raleigh, N. C.—North Carolina Trapshooters' Association tournament.
Aug. 9-10.—Birmingham, Ala.—Alabama tournament.
Aug. 9-12.—West Baden, Ind.—Indian tournament; \$1,000 added money.
*Aug. 10-11.—Bradenville, Pa., Rod and Gun Club.
Aug. 10-12.—Brantford, Ont.—Dominion of Canada Trapshooting and Game Protective Association's fourth annual tournament. A. B. Cutcliffe, Sec'y.
Aug. 15-20.—Buffalo, N. Y.—New York State shoot.
Aug. 23-24.—Renovo, Pa.—Recreation Gun Club two-day target tournament. Geo. B. Dechant, Sec'y.
Aug. 24-25.—Hot Springs, S. D.—The Interstate Association's tournament, under the auspices of the Hot Springs Gun Club. H. A. Gayhart, Sec'y.
*Aug. 25-26.—Tarentum, Pa., Rod and Gun Club.
Sept. 5.—Auburn, N. Y.—Labor Day tournament. Knox and Knapp, Mgrs.
Sept. 5.—Springfield, Mass.—Fall tournament on Labor Day; \$25 added. C. L. Kites, Sec'y.
*Sept. 6-7.—Irwin, Pa., Rod and Gun Club tournament.
*Sept. 14-15.—Ruffsdales, Pa., Rod and Gun Club.
*Sept. 27-28.—Monessen, Pa., Gun Club.
*Oct. 4-5.—Allegheny, Pa.—North Side Gun Club.
*Western Pennsylvania Trapshooters' League tournaments. C. G. Grubb, Sec'y, Pittsburgh.

Analostan Gun Club.

WASHINGTON, D. C.—The seventh weekly shoot of the Analostan Gun Club was held Thursday afternoon, June 23. The day was an ideal one for shooting, and high scores were made. Jos. H. Hunter, John Coleman and Francis Petrola were the top men, but a number of others pressed them closely for first honors.

Hereafter two shoots will be held each week: Tuesday and Saturday afternoons, until the season closes in September. On next Tuesday afternoon the members will commence a contest for the club prizes—a handsome gold medal donated by the Hunter Arms Co., and two silver cups. The shooters will be divided in classes A, B and C, according to their ability, and the winners each week will be handicapped. The prizes will be awarded to those who win them the most times during the season.

Much interest was manifested in the 25-target event shot during the afternoon, and the scores in that shoot are given in detail.

Following are the scores made during the afternoon: Duvall shot at 80, broke 59; Petrola, 75, 69; Allnutt 70, 56; Green 70, 44; J. H. Hunter 60, 58; Coleman 60, 56; Kennedy 60, 39; Miles Taylor 50, 43; Walters 50, 40; B. Wilson 40, 36; Craig 40, 33; C. S. Wilson 40, 34; Hogan 40, 30; Haven 40, 17; Brown 30, 25; Aukward 30, 23; Dr. Taylor 30, 22; Baker 30, 22; W. H. Hunter 30, 22; Koons 30, 22; Monroe 30, 15; Orrison 25, 20; Utz 20, 14; Wilhite 20, 18; Shoemaker 20, 17; Heintz 20, 16; Geo. Wise 20, 16.

Twenty-five target event: Heintz 20, Dr. Taylor 23, Coleman 25, Brown 22, Craig 20, C. S. Wilson 17, Orrison 18, Hogan 18, Petrola 23, Utz 14, Monroe 19, Koons 17, Aukward 17, B. Wilson 20, Wilhite 22, Shoemaker 21, Hitchcock 10, Haven 13, *Craig 21, *Heintz 22, Geo. Wise 22.

*Re-entry.

MILES TAYLOR, Sec'y.

Aquidneck Gun Club.

NEWPORT, R. I., June 25.—The main event at Wednesday's shoot was a match for the Povel cup at 50 targets, and under the good conditions prevailing some fine scores were made. Mr. Harold A. Peckham scored 46, which included straight scores in three or four events, and the last 25 straight. Bowler's 43 and Povel's 42 also show meritorious work; in fact, the greater part of the contestants totaled over the 70 per cent. mark.

On Monday the Canonchet Club, of Narragansett Pier, will celebrate the glorious Fourth with a shoot, on which occasion we hope to represent the club with at least two squads.

Ossining Gun Club.

OSSINING, N. Y.—The appended scores were made at the regular bi-monthly shoot of the Ossining Gun Club. We have given up trying to account for slim attendances at shoots. There is one thing certain, there was no pleasure in shooting to-day with the thermometer at 95 degrees in the shade. Those who attended were either enthusiasts or fools, so we got together and let ourselves down easy by acknowledging the latter.

Ideal Gun Club.

THE Ideal Gun Club, of Bellevue, Ky., just "across the creek" from Cincinnati, held its regular shoot on June 19, only a few members taking part. A. W. du Bray, a visitor, made the high score, 47 out of 50. Other scores were: Yeatman 43, L. Gastright 43, Wellinger 41, Schaffer 39, Fisher 37, Louis 35.

BONASA.

Grand American Handicap.

THE fifth Grand American Handicap at Targets, held at Indianapolis, Ind., June 21-24, on the grounds of the Indianapolis Gun Club, eclipsed in magnitude and prestige all its predecessors.

The grounds, sixteen acres in extent and beautiful in the bright green of summer time, were perfectly equipped for this great event. Large, open tents, one at each of the five sets of traps, were plentifully supplied with camp chairs and afforded comfortably cool quarters for the spectators. Other tents were in place here and there in numbers sufficient to meet all requirements. An ice cream tent was close by the club house, while on the opposite side was a large dining tent. Again, some distance away from the club house was a large refreshment tent, where lemonade and other light beverages were dispensed to the thirsty groups incident to the hot days. The tents were all at comfortable distances from the club house and from each other, with a purpose to avoid crowding and congestion. The plan worked admirably. The spectators were distributed over the grounds. Notwithstanding the large number of people on the grounds each day, any one could walk freely about from one place to another without any jostling or delay.

Five sets of expert traps, arranged Sergeant system, was the target-throwing plant provided for the competition. They extended in a straight line in front of the club house and at right angles to it, No. 3 set of traps being directly in front of it, and this was the set used in the spectacular climax called "shooting off the ties." The contestants at the score faced toward the north, thus having a good light. The piazza and balcony of the club house afforded excellent places of rest and points of view to the spectators. The piazza was a favorite place and was thronged at all times, during the competition, with a fine array of ladies and gentlemen.

A specially competent crew of trappers served the traps, so that the traps in consequence were ready for action promptly when required. Their promptness and efficiency never flagged. Each set of traps had a pit, covered by a roof, which sloping gently upward, formed a screen only a few inches high, thus the targets, when in flight, had much the appearance of coming out of the ground. This feature enabled a shooter to catch sight of the targets quickly at the commencement of their flight; but with many of the contestants who were unaccustomed to such favorable conditions, this seeming advantage caused a shooting in quicker time without corresponding allowances in respect to the flight of the target for such time, and misses were not infrequent as a result. One hundred and twenty thousand targets were placed in the five pits before the competition began, and the supply was well maintained throughout. Thus there were no annoying delays while barrels were rolled to the traps, and there unheaded and unpacked, as is a common incident at some other tournaments.

In short, the competition, once started, had no delays at all. Once started, it ran along as smoothly as a perfect mechanism.

This tournament had a most active, hearty local support. The Indianapolis Gun Club was strongly in evidence, both in the competition and in material assistance to the management. The officers of the club were specially courteous and active in assisting. The president, Mr. W. T. Nash, Mr. W. B. Allen and Mr. J. W. Bell worked like beavers. Mr. Bell, who is the secretary, had charge of the ammunition supply, which was stored in a small building about 50 yds. from the club house. Any standard load of any manufacturer was there in stock. And any purchaser had to specify what he desired; that is to say, Mr. Bell or his assistant would not give any advice as to loads, even if asked for it. A large card, in a conspicuous place before the purchaser, bore, in large black letters, the following legend: "We are impartial as to what ammunition you use. Ask for what you want."

Mr. Nash, ever affable and obliging, was incessantly active in attending to the duties incident to his office of president. To his efficiency as an officer he adds a most pleasing and gracious personality. Between extending a hearty welcome to visiting sportsmen, giving information to the anxious inquirers, assisting the coming and speeding the parting guest, he had no idle moments. As an illustration of the careful preparation concerning details which had been observed by the officers of the Indianapolis Gun Club, one will be mentioned as a key to all the rest. Telegraph messages received in Indianapolis for any of the shooters were forthwith telephoned to the club house on the grounds and promptly delivered. If a shooter desired to send a telegram, the telephone in like manner was at his service. In passing it may be mentioned that the club is an amateur organization, and does not hold shoots for the sake of the treasury. Any moneys made are expended in improvement of the grounds and therefore accrue to the benefit of all concerned.

To the hero of many flawless tournaments, Mr. Elmer E. Shaner, manager of the Interstate Association, more than praise is due. The shooters of America are indebted to him not only for managing a mammoth tournament without an error, but for the example of how a tournament should be run. Most tournaments, as to details, are a series of readjustments and most managers are actuated by a series of afterthoughts. There was none of those in this G. A. H. Everything was fully thought out and efficiently provided for in advance by Mr. Shaner. Having arranged a perfect working plan for the contestants, they were required, by him, to act their part promptly. They were notified that when their names were called out, they were duly notified to shoot or to get ready to shoot, as the case might be, and that any one who was not ready then to shoot with his squad would be disqualified. He meant what he said. The shooters learned that Mr. Shaner's rules were not mere abstract verbalisms. They imposed precisely what their words implied. A number of shooters who neglected to make their entries each day at the proper time as a consequence found that they could not make them at all. No personal plea or any other plea served to change the situation. The shooters had to live up to the rules or suffer the consequences. The G. A. H. would have been the greater by several entries had some over-deliberate applicants been permitted to enter after the entries were closed. No exception was made in favor of any one. Knowing this, each one fitted into his place with care. Each one had a fair, open field without fear or favor, but it devolved on each one to attend to his own interests in proper time and place, else the interest of others were violated if such neglect were ignored. But violations were not tolerated. Mr. Shaner offered a perfect working system of competition. The shooters, perforce, had to fit themselves to it. Consequently the competition from start to finish ran as smoothly as clock-work.

The class of contestants and spectators was of a high order. They were of the refined part of society. They were gentlemen and ladies, as could be observed at a glance. There were the same atmosphere of good breeding and nicety of deportment which obtain at a fashionable opera. The ladies honored the tournament with their presence in goodly numbers. It was a decorous, pleasant tournament in every particular.

The system enforced by Mr. Shaner at this tournament was truly ingenious. The total number of contestants in a handicap were divided into five sections. Each section was assigned to a set of traps, and thus became a unit. It is clear that the total divided thus could be much more expeditiously and accurately handled than it could as one body. Moreover, a much more perfect equity was established as to weather, light, waits, times of day, etc., besides saving much valuable time in keeping all the traps at work from start to finish. Under the prior system, one squad after another followed from No. 1 trap down the line of traps, thus imposing a long wait on those who were in the last squads, causing much inequality as to light, etc., and losing much time. Concerning the latter, when No. 1 squad started, four sets of traps were idle. Shooting at No. 2, three sets were idle. Shooting at No. 3, two sets were idle. Shooting at No. 2, one set was idle. Thus, while No. 1 squad at the start was shooting under the old system, when it shot at five sets of traps, ten more squads could have shot at the same time under the new system which starts each of the five sets at the same time. Mr. Shaner nevertheless was a busy man during the day. Aside from the perfection of the general plan, there were endless matters incident which required to be specially passed upon. He had no idle moments. The whole tournament ran so smoothly that it appeared easy, but arranging the preparatory work for a day's competition required the work of Mr. Shaner and his lieutenants till 1 o'clock in the morning of that day, or even later.

The assistant manager was Mr. Chas. A. North, Cleveland, O., who as an expert had charge of the traps, and gave his attention to squad hustling in general, and to any matters which tended to expedite competition.

Mr. Shaner's assistants, above mentioned, were all high class, educated men, and were remunerated accordingly. They were courteous, alert and energetic. They kept all the details promptly up to place. The squad hustlers were armed with megaphones, and while one squad was shooting, they called up the shooters whose turn it was and made ready the next squad, which lined up promptly in place as the preceding squad stepped from the firing points.

At each set of traps was a board which showed the number of squads in the section, their shooting and the number of the squad which was shooting. The squad having finished, the score board was reversed, and the score card of the next squad, which had been fastened on the back of the board, was thus in place in front. The filled score sheet was next removed from the back of the board, and the score sheet for the next squad was tacked in place, so that when the board was again turned, all would be ready for action as before.

The steady growth of the G. A. H. at Targets has been a remarkable feature.

In 1900 there were 74 entries. This was the first G. A. H. at Targets. It was won by Mr. R. O. Heikes, of Dayton, O., with the score of 91. By the way, there was much regret ex-

R. D. GUPTILL, AITKIN, MINN.
Winner G. A. H. at Targets, Indianapolis, 1904.

And in this connection Mr. Shaner was heard to remark that he had the ablest staff at Indianapolis that he ever had.

But the spontaneous praises bestowed on Mr. Shaner, and which were frequently uttered all through the tournament, were the best evidence of genuine appreciation. The general consensus of opinion was that in handling big tournaments, Mr. Shaner was without a peer. That he had an able staff of assistants, the following enumeration will show:

The cashier's office was in charge of Mr. Fred C. Whitney, of Des Moines, Ia. Mr. Whitney's skill in the cashier's office is as national and good as is Mr. Shaner's as manager. For keeping accurate account of all the intricacies incident to taking in entries and paying out winnings, with the great totals balancing nicely to a cent, Mr. Whitney has many times proved his worth, and has officiated in prior G. A. Handicaps.

The compiler of scores, Mr. J. K. Starr, of Philadelphia, has acted in the like capacity in G. A. Handicaps of several previous years, and has the skill and knowledge necessary to fill the office ably, notwithstanding the infinity of detail involved in it. He had an able assistant in Mr. H. S. Humphrey, of Indianapolis. This was Mr. Humphrey's first engagement with the Association, but not his first experience in matters of sport, he having been more actively identified with field trial clubs, of which he has been an officer and chief worker for a number of years past. The clerks to the compiler were Messrs. Maynard E. Allen and Coburn Allen, of Indianapolis, Ind.

The referees were as follows:

J. L. Hynier, Indianapolis, Ind., at No. 1 set.
Albert E. Ballweg, Indianapolis, Ind., at No. 2 set.
D. C. Morris, Indianapolis, Ind., at No. 3 set.
Matt Harris, Muncie, Ind., at No. 4 set.
J. E. Bombarger, Indianapolis, Ind., at No. 5 set.
The scorers were as follows:
Everett Shepherd, Indianapolis, Ind., at No. 1 set.
Clyde Osborne, Indianapolis, Ind., at No. 2 set.
George Kerr, Indianapolis, Ind., at No. 3 set.
Clen Forbis, Muncie, Ind., at No. 4 set.
Clen Duncan, Indianapolis, Ind., at No. 5 set.
The squad hustlers were as follows:
E. R. Holden, Indianapolis, Ind., at No. 1 set.
Edward Dark, Indianapolis, Ind., at No. 2 set.
J. A. Martin, Indianapolis, Ind., at No. 3 set.
J. L. Winston, West Baden, Ind., at No. 4 set.
M. W. Sowell, Indianapolis, Ind., at No. 5 set.

pressed at the absence of the "Daddy of Them All" at Indianapolis. He is convalescing slowly from the attack of fever from which he suffered recently, but was not strong enough to venture into such strenuous activity as pertains to the G. A. H. That he holds a large warm place in the hearts of the shooters was many times in evidence in the form of expressions of esteem, regret and sympathy.

In 1901 there were 75 entries, an increase of 4. Mr. E. C. Griffith, of Pascoag, R. I., won with a score of 95.

In 1902 there were 91 entries, a gain of 16 entries over the previous year. Mr. C. W. Floyd, of New York, won with a score of 94.

In 1903 the Handicap took a jump to 192 entries, of which 180 were starters. Mr. M. Diefenderfer won on a score of 94.

The background was the sky. The flat prairie land was as clear to shoot over as water. A full view of the target was had from the time it left the trap till shot at or till it fell. The targets were thrown a full 50 yds. While they looked easy, they were not so easy as they looked, as the scores will show.

The weather was of the delightful summertime. The temperature some of the time was intensely warm, but there was generally a breeze to convey comfort to the visitors. The light was clear, though at times there was a high glare from the sunshine which was not any benefit to weak or faulty eyes.

The street car company put on extra cars during the morning and evening hours when the traffic to and from the grounds was heaviest, and ran on half hour, instead of an hour, schedule. The six miles' ride was through a pleasant farming country when once the cars were outside the city, and was an agreeable part of the tournament.

The total number of targets thrown during the tournament was 152,300, truly an enormous aggregate.

Monday was not of the Interstate Association tournament, but it was a day of great and busy practice. Five 20-target events were shot, in which about 157 participated. Mr. J. L. D. Morrison made the extraordinary score of 99, while several scored 98, namely, C. W. Budd, J. Boa, J. A. R. Elliott, H. G. Taylor and J. W. Garrett. With this and the great scores in evidence at recent tournaments there was good ground for belief that the G. A. H. would be won this year on a straight score, but it was not to be.

June 21, First Day.

The programme of the first day provided ten events, each at 20 targets; \$25 added to each, entrance \$2. All events at un-

[illegible]

Besides winning the cup, Mr. Guptill won \$312, and the runner-up, Mr. Randall, received \$280. Those who broke 94 received \$171.60. They were: C. W. Budd, Burton Call, B. F. Seott, M. Anderson and J. R. Taylor.

F. Alkire, C. M. Powers, C. R. Wilkinson, E. D. Fulford, J. Michaelis, D. A. Upson, E. C. Griffith, E. L. Hann, Col. Anthony, O. F. Britton, E. Brown, Geo. Volk, O. A. Felger, J. S. Fanning, L. A. Cummings and F. H. Sharp broke 93 and received \$43.65 each.

G. P. McDowell, C. F. Reust, H. Jeffries, J. E. Wright, J. S. Boas, W. Huff, J. L. D. Morrison, R. S. Rhoads, J. F. Calhoun, M. R. Clark, and W. R. Randall broke 92 and received \$31.20 each.

F. D. Kelsey, H. M. McMurchy, J. W. Garrett, H. G. Taylor, W. D. Townsend, E. W. Holding, J. A. Flick, P. C. Ward, H. W. Anderson, F. H. Snow, H. Dunnell, Ben Eick, J. H. Loshbough, C. Bellman, E. Pragooff, A. J. Spinney and F. D. Ellett broke 91 and received \$29.35 each.

The total purse amounted to \$3,118.50.

June 24, Fourth Day.

The programme of the fourth day had five amateur 20-target events, entrance \$2; \$25 added, and the Consolation Handicap, open to all.

The conditions of the Consolation Handicap were as follows: 100 targets, unknown angles; \$7 entrance, targets included; handicaps 14 to 22yds.; high guns, not class shooting; \$100 added to the purse. Winners of money in the Grand American Handicap at Targets had 1yd. added to their handicaps, and non-winners of money in the Grand American Handicap at Targets went in 1yd. In addition to first money, the winner received a trophy, fifty dollars of the net purse being reserved to purchase same. Entries in these events were made before 5 P. M. Thursday, June 23. Penalty entries were not taken for these events.

Mr. W. H. Heer was high with a score of 98.

The handicap was divided into five events of 20 targets each, in manner similar to the prior handicaps. The winners and their winnings were as follows:

W. H. Hcer, 98, \$86.50; H. McMurchy, 97, \$77.85; H. Pearce, 96, \$63.20; A. C. Connor, Fred Gilbert, H. D. Freeman, J. F. Mallory, C. E. Spencer, F. V. Nichols, and B. Cole broke 95 and won \$38.70 each. C. R. Williamson, C. W. Phellis, H. D. Taylor and P. C. Ward broke 94 and won \$17.30 each. T. E. Hubby, O. N. Ford, C. S. Bahnney, C. O. Prowse, E. H. Storr, J. L. D. Morrison, T. H. Parry, Guy Burnside and A. P. McDowell broke 93 and won \$17.30 each. J. M. Hawkins, Ed Foust, Ed Brady, W. M. Eaton, J. W. Hightower, Lem Willard, Ed Rike, J. R. Taylor, H. Getchell, W. Webster, J. L. Remiatte, C. D. Linderman and C. O. Le Compte broke 92 and won \$10.60 each.

The Consolation Handicap had 163 contestants, a large tournament in itself. The scores, etc., follow:

DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have published. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York. FOREST AND STREAM goes to press on TUESDAY OF EACH WEEK.

The Canonchet Gun Club has arranged to hold a shoot at Narragansett Pier, R. I., on July 4.

The total number of targets trapped at the G. A. H. at Indianapolis, last week, the time being four and one-half days, was 152,360.

Mr. Geo. B. Dechant, secretary, informs us that the Recreation Gun Club, Renovo, Pa., will hold a two-day target tournament on August 23-24.

It has been decided that Mr. Chas. North will have charge of the traps and give his skilful, energetic assistance as general expert at the Indian tournament, to be held at West Baden, Ind., August 9-12.

The Indianapolis Morning Star, concerning the shooting at Indianapolis, on the first day, June 21, of the G. A. H., presents some figuring as follows: "Forty-three thousand three hundred and eighty cracks at 5 cents per crack brought the total cost of the day's shooting up to \$2,169."

Mr. John S. Wright, manager of the Brooklyn Gun Club, announces a shoot for July 4, commencing at 2 o'clock P. M. There will be three prize events on the programme. To reach the grounds, take Kings County Elevated to Crescent street station, thence by hacks to the grounds on Kaiser's farm.

Mr. J. L. D. Morrison, of St. Paul, Minn., made high amateur average in the amateur events of the G. A. H. programme, at Indianapolis, last week, and also beat all the professionals for high average in the same events, leading Mr. J. A. R. Elliott, the highest professional, by one target.

There was a strong, widespread sentiment among the shooters at Indianapolis, in favor of holding it there next year. A petition in favor of Indianapolis, signed by nearly every sportsman present, was prepared for submission to the Interstate Association. There was a rumor that some other cities were interested in securing this great event.

Mr. E. J. Laughlin, secretary, writes us as follows: The Riverside Gun Club, of Utica, will hold a Jack Rabbit shoot on its grounds, foot of Meadow street, on July 4, commencing at 12:30 P. M. The programme will consist of seven 10-bird events, \$1 entrance in each, birds extra at one cent each. Three moneys, 50, 30 and 20 per cent. Extra events, time permitting.

Mr. Fred C. Whitney, the cashier of the G. A. H. at Targets, last week at Indianapolis, notwithstanding his many busy moments taking in and distributing many thousands of dollars in cash, was the calmest, most imperturbable gentleman on the grounds. Dressed in spotlessly neat negligee apparel, he seemed to be comfortably cool in the hottest weather. Handling the cash, keeping trace of it through all the ramifications of percentages and winnings and bringing all the accounts out balanced to a cent, seemed to disturb him no more than a sweet shower disturbs a duck's back. As an expert in the cashier's office, Mr. Whitney has repeatedly proven his excellence.

Mr. W. R. Crosby, at the G. A. H. last week, was not in a state of mind for target breaking. For several weeks past, members of his family have been afflicted with fever, and consequently he was in a state of constant anxiety concerning their welfare. He was also worn by long vigils during weeks past. That he shot so well under the circumstances is marvellous.

Capt. James R. Malone, 2671 Pennsylvania avenue, Baltimore, Md., has announced his tenth annual summer tournament, to be held at one of Baltimore's new summer resorts, Love Point, August 3 and 5. The competition will be open to all. The programme will include both target and live-bird competitions. Mr. Malone will be pleased to send programmes to all who apply for them.

A rabbit foot, duly qualified as to grave yard domicile, midnight death and darkness, etc., seems to be of no avail in protecting the professional from the amateur in tournaments. While the rabbit feet are doubtlessly potent as charms in an exceedingly generally way, they seem to be charmless in G. A. H. in particular. The average amateur trapshooter seems to be too potent for the special rabbit tootsie wootsie.

The last live-bird match for the New Jersey State championship took place at Lake Denmark, N. J., on Saturday of last week, between Messrs. H. C. Koegel and T. W. Morfey. The birds were a good lot. Mr. Koegel won by a score of 23 to 22. This trophy will be associated with many well contested matches for its possession in the past, and it was won finally by one of New Jersey's most steady and skilful shooters.

The programme of the Buffalo Bill Gun Club tournament, to be held at North Platte, Neb., July 18-20, is a work of art. Thirty-four target events are provided for the three days. Targets thrown from 72ft. tower, will be a feature of several events. The events are at 15 and 20 targets, \$1.50 and \$2 entrance; \$5 and \$8 added. Event 22 on the second day will be at 50 targets, for Denver-Post trophy. Ship guns and shells, prepaid, to W. S. Dolson.

The five sets of traps at the G. A. H., at Indianapolis, Ind., last week, on Tuesday, boosted up several notches the records of target throwing in one day. The number thrown, 42,680, is likely to remain undisturbed in the realm of the superlative for a long while. Incidentally, the record is both a testimonial to the perfection of the traps, and the perfection of the Indianapolis Gun Club's equipment. The previous high record was that of Buffalo, in 1899, when about 33,000 were thrown in one day.

Messrs. Knox and Knapp, Auburn, N. Y., inform us that they will give a large tournament on Labor day, September 5. They will give added money. Targets at 1½ cent. In the last event, for all shooters who have shot the programme through, they will give a \$50 hammerless gun, no charge for targets or for gun. Those who have shot 80 per cent. in programme, 16yds.; 85 per cent., 17yds.; 90 per cent., 18yds.. Also a nice hammerless will be given in event No. 6, regular merchandise. Book programmes sent out August 15.

The ultima thule of industrial effort is sometimes colloquially expressed by the term, "He worked like a beaver," but a busy beaver in comparison with Mr. Elmer E. Shaner managing the Grand American Handicap at targets last week, would be an example of calm repose in comparison. And yet in ruling upon and arranging all the infinity and diversity of G. A. H. detail, Mr. Shaner never was flurried, never was at a loss as to what was the proper thing to do and how to do it, and, withal, he was never irritable or peevish.

Mr. Irby Bennett, president of the Interstate Association, was an ubiquitous and indefatigable worker at the G. A. H. at Targets last week. As the chief executive of the Association, he was ever graciously alert to its best interests. Thoroughly trained in business affairs, he also is an ideal of the suaviter in modo, fortiter in re. As a speech maker of fine presence, he shone forth at his best. His presentation speeches, incident to the delivery of the cups to the winners, abounded in felicitous, sportsmanlike sentiment, delivered with accuracy and elegance of diction.

The programme of the Duluth, Minn., Central Gun Club's tenth annual tournament sets forth that \$350 added money will be a feature of the competition. The dates are July 20 and 21. There are thirteen events each day, at 15, 20 and 25 targets. There are eight at 15 and four at 20 targets, \$1.50 and \$2 entrance. No. 13 on the first day is "the wolf" event, 25 targets, \$5 entrance, high guns, 60 and 40 per cent. On the second day, No. 13 is "the coyote," and has conditions similar to "the wolf." There are thirty high average prizes, ranging from \$20 to \$5. Shooting commences at 9 o'clock. Ship shells to J. W. Nelson, 5 Superior street. The competition is for amateurs. Sliding handicap. Moneys 40, 30, 20 and 10.

The Interstate Association have issued the programme of their tournament, to be given for the Grand Forks, N. D., Gun Club, July 27-28. The events are alike each day, eight at 15 and one at 20 targets, entrance \$1.50 and \$2, and added money \$15 and \$20. Total added money, \$310. Targets 2 cents. July 26 will be practice day. Grand Forks is situated on the Great Northern and Northern Pacific R. R. Rose system, 4, 3, 2 and 1. Mr. W. M. Ferguson is the secretary. Guns and ammunition marked and prepaid in owner's name, care of the Ferguson Sporting Goods Co., will be delivered on the grounds free of charge. Shooting will commence at 9 o'clock. The Ferguson Sporting Goods Co. event is open to manufacturers' agents only. It is at 50 targets, no entrance; prize Colts automatic pistol.

The Cincinnati Gun Club sets forth a bountiful variety of shooting in the programme of their tournament to be held July 19-22. For one apply to the secretary, A. B. Heyl, 1870 Madison road, Cincinnati. Guns and ammunition, prepaid, sent to the Peters Arms and Sporting Goods Co., 119 E. Fifth street; Powell & Clement Co., 418 Main street; The Roll-Crawford Brendamour Co., 28 E. Fifth street, and G. W. Schuler, 626 Vine street, will be delivered on the grounds free of charge, if received before 4 o'clock, July 16. Dinner served at club house, table d'hôte, 50 cents, a la Gambell. In added money and guaranteed purses, \$2,200 are offered. Competition is open to the world. Handicaps 14 to 23yds. for those who shoot over 85 per cent. The club superintendent, Mr. Arthur Gambell, famous as a skillful trapshooter and tournament manager, will manage the tournament.

BERNARD WATERS.

IN NEW JERSEY.

Emerald Gun Club.

New York.—Appended are the scores of the Emerald Gun Club shoot, held at Outwater's, Carlstadt, N. J., June 21. You will note that we shoot the January and February shoots of 1905. This ends our shooting year. Mr. Louis Colquitt won high average for the year. I will send you list of winners of average and point prizes after our annual meeting.

The club will probably have a few contests at targets the coming six months, at Capt. Dreyer's grounds at Bergen Beach, L. I. Capt. Dreyer and Capt. Rierson, at the shoot, gave the club \$10 in gold each, added to the general prizes, making a total of \$120 in cash, besides the valuable merchandise prizes usually in the club's prize list.

The old Emeralds were organized in 1881, and the old war horse, Dr. Hudson is the only charter member left, and is still in harness and looking for trouble. Our hats are off to him, metaphorically speaking, as the lamented Jacob Pentz would say, and may he shoot in the ranks of the Emerald Gun Club for many years to come in live-bird contests, whether it be in Pennsylvania or Kentucky in the future.

Ex-Presidents Regan and Joeger were among the interested spectators of our probably final shoot in the State of New Jersey.

The weather was warm. A good wind, blowing from 7 o'clock, made the birds outgoers. President May shot in good form, considering that business kept him away from the last four shoots. Catton shot well. A sweep was shot on the total of 20 birds. Schorty was first; second was divided between Koegel and Van Valkenburg; Catton was third alone:

New Jersey State Championship.

Lake Denmark, N. J., June 25.—The contest for the New Jersey State championship between Messrs. H. C. Koegel and T. W. Morfey, to-day resulted in a victory for the former. Mr. Morfey had defended it several times successfully in recent months. To-day he was not in his usual good form. The birds a good lot.

Mr. Koegel is known as one of New Jersey's expert shooters, and has competed successfully many times heretofore at the traps. This is the last live-bird shoot in the State of New Jersey for the State championship, and the medal emblematic of it.

The expert in trapshooting matters, Mr. Frank E. Butler, acted as referee. The scores:

T W Morfey.....	1111022121*2111021111211-22
H C Koegel.....	02222222112202121222222-23

The match was followed by a \$5 sweepstake at 5 birds, the scores of which follow:

Ryhan.....	10110-3	Hinchman.....	10011-3
Colquitt.....	22221-5	Hassenger.....	22021-4
Koegel.....	21211-5	Class.....	02221-4
Morfey.....	11211-5	Fanning.....	12000-2

Montclair Gun Club.

Montclair, N. J., June 25.—But seven men were present to-day, many of the members having gone away for the summer.

Mr. Kendall was shooting in good form, and toward the close Mr. Cockefair showed considerable improvement, by that time having "got on" to his new gun. Mr. Batten also shows improvement over recent shooting. Scores:

EDWARD WINSLOW, Sec'y.

Independents Defeat Pattenburgs.

Pattenburg, N. J.—A Very interesting tournament took place at Pattenburg, June 18. About thirty shooters commenced shooting at 10 o'clock and kept it up fairly well all day. E. F. Markley made longest straight run, a straight 50 in the forenoon. The contest between the Independent Club, of Eaton, and the Pattenburg Club resulted in a defeat by 23 targets in the Independents' favor. Several visitors witnessed the events, as well as the match between the two clubs, which was very interesting, until one of the Pattenburgs made a break and went down to 13, and with a few differences of this kind, it put the Pattenburgs out of business. As the shoot was for the suppers, there seemed to be a larger gap than ever, and it looked at one time as if it would be impossible to get enough together to feed all hands; but after trying it for about fifteen minutes at Mr. Milbern's table, it was agreed that it would be useless to try to in any way consume all the tempting food he had prepared for the boys. All, well pleased, departed for their several towns and cities, hoping soon to meet again. Scores:

Independent—J. Pleiss 24, O. Skeds 19, J. E. Gunther 20, H. Snyder 21, W. Hahn 23, A. H. Maurer 22, J. E. Maurer 23, H. G. Miller 22, J. H. Heil 20, E. F. Markley 24; total 218.

Pattenburg—P. Rockafellow 23, Harry Gano 21, J. Warford 24, E. Wilson 23, R. Stamets 19, J. Williamson 13, A. E. Holbrook 18, L. Rupell 15, N. Stamets 21, H. L. Gano 18; total 195.

C. W. BONNELL, Sec'y.

Cincinnati Gun Club.

CINCINNATI.—The shoot of the Cincinnati Gun Club, on June 25 was not so well attended as usual, although the weather was fine.

In a team match at 50 targets, 22yds. rise, shot on the same day, Gambell and Rhoads were defeated by T. H. Clay and Henderson.

Parker prize gun, 100 targets, handicap of added targets: Peters (20) 100, Herman (30) 100, Maynard (18) 100, Jack (30) 100, Kramer (40) 100, Lindsley (30) 100, Norris (30) 100, Ackley (35) 100, Roanoke (40) 100, Andrews (55) 100, Smith (60) 100, Block (18) 98, Williams (18) 98, Faran (18) 97, Gambell (10) 90, Medico (12) 88.

Boston Gun Club.

Boston, Mass., June 22.—Just an even dozen shooters journeyed Vellingtonward to-day, and though a small attendance, it lacked nothing in enthusiasm.

While no grand American handicap was being shot, there was interest shown by all, the prize match seeming to have the attention first and then the team match, which proved the fun maker of the afternoon.

Capt. Frank vows that a rabbit's foot will bring him better luck next time, and is on the lookout for the largest one he can secure, as Bell is not going to monopolize all the winning teams if he can prevent it. Bell still intends to dig and promises nothing, except to see that his team is in A1 shape for the fray. Nothing would suit him better than to take another fall out of all comers.

Worthing ventured forth for his first match score to-day, and annexed a nice 23, which was just too good for the rest and came near pocketing the high average. It would have done so if he had left the 21yds. mark alone, which accounted for his 19, in the last event. But Charlie was always enthusiastic, and never could see anyone shoot, without his being in it, and conditions count nothing where he sums up the enjoyment. Woodruff and Co. were in the best of trim, too, high average being one of the honors bestowed upon them, and 22 in the prize match cutting out all told 17 and incidentally securing second place in the totals.

North Dakota State Shoot.

MINOT, N. D., June 15.—The North Dakota State tournament was held here last two days. The attendance was not large, as this town is the extreme northwestern limit of the towns having clubs. However, those present shot through both days, and all were well pleased with the entertainment furnished by the home club. Mr. Parker, the president, was the man for the place.

One of the many enjoyable features was the shooting at the traps by Mrs. C. H. Parker, and her scores were a surprise to all.

B. O. Seymour and H. C. Hirschy assisted the management, and Herman is a whole team in himself. Mr. Seymour was caught in the hotel fire and was not himself the first day, as his scores will show.

D. C. Rand, of Jamestown, won the high average for State men, closely followed by Gus Evander, with 270. Hirschy was the high amateur, though Seymour tied him the second day.

The championship medal was won by F. H. Sprague, of Grafton. The Simpson trophy fell to the lot of Capt. N. N. Main, of Condo. The Minot team won the State team trophy.

The next State shoot will be held at Grand Forks. G. E. Dies was elected President; R. W. Main, Vice-President; C. H. Parker, Second Vice-President; W. M. Furgeson, Secretary, and W. B. Wood, Treasurer. Scores:

The Acquahongas Win.

CASTLETON, Staten Island, June 22.—A three-cornered team match was shot at Castleton Corners on June 18 between the Castleton Gun Club, of Castleton Corners, Acquahonga Gun Club, of Tottenville, and the White Plains Gun Club, of White Plains, N. Y. Seven men to a team, 25 targets per man, thrown from magautrap. The home club gave a \$5 prize to the high gun. This was divided between Seawood, Joline and Wolfgang, who scored 23 each. The second match will take place at White Plains, some time in July.

							L. A. SCOFIELD.						

Somersville, Conn., Tournament.

THE Somersville, Conn., Gun Club will hold an all-day tournament on July 14 next. A good programme has been prepared for various events, covering in all 200 targets. Money will be divided by the Rose system. Three expert traps, set Sergeant system, will be used along with bluerock targets. Shooting will commence at 9:30 A. M. Grounds are situated on line of Somers and Enfield trolley, and cars leaving Thompsonville at 2 minutes past the hour, will run directly past the grounds. All shooters welcome and a good time is promised. An attraction to Connecticut shooters will be a 50-target race for State championship, in which the winner is guaranteed \$25; also other prizes will be given in this event if sufficient entries are received. This will be open to all amateurs at present residing in the State, and will be at 16yds. rise to all. No handicap of any kind. Shooters from outside the State will find an attractive programme outside this event. Grounds are finely situated for high scores. Lunch will be served on the grounds. For programmes address the secretary, A. M. Arnold, Somersville, Conn.

Norwich (Conn.) Shooting Club.

THERE was a small attendance at the practice shoot of the club held on Saturday afternoon, June 18, the best scores being made by Mr. Prest. The silver spoon contest resulted as follows: Prest 19, Ockford 18, Taft 16, Mitchell 15, Amberg 15, Aborn 14, Brown 14, McCord 12. For the ammunition ease: Aborn 9, Prest 9, Ockford 9, Taft 8, Mitchell 7, Amberg 6, Brown 6, McCord 5. The scores follow:

Events:	1	2	3	4	5	6	7

McCord	12	13					25

I. P. TAFT, Sec'y.

Taylor (Texas) Gun Club.

TAYLOR, Texas, June 16.—Eight of the target shooters were out at the Fair grounds to-day, and shot at 100 targets each. We are now getting ready for the big shoot to be held here in connection with the annual meet of the Fair Association, July 4, 5 and 6. Scores: Gilstrap 92, T. Hogen 89, F. Welch 86, B. Rome 84, A. Zizinia 83, A. Dabney 81, H. Eicholtz 80, Joe Pfeffer 76.

SIDE LIGHTS OF TRADE.

In the preliminary events of the Grand American Handicap, last week, J. A. R. Elliott, with his Winchester repeating shotgun and Winchester shells, broke 179 targets out of a possible 180. In the preliminary handicap, honors were even between S. H. Cummings and W. H. Clay, with scores of 98 out of 100. Mr. Cummings won the shoot-off. Both used Winchester factory loaded shells, and Mr. Cummings a Winchester repeating shotgun. In the Grand American Handicap, R. D. Guptill, using a Winchester repeating shotgun, and W. N. Randall, using Winchester factory loaded shells, tied with a score of 96 out of 100. Mr. Guptill won the shoot-off.

Tom Marshall, of Keithsburg, Ill., and everywhere else, stated, "I have won the G. A. H. twice with U. M. C. shells, and the unexcelled quality of the U. M. C. products appeals as strongly to the expert as they do to such amateurs as Mr. Diefenderfer, the last year's winner, and to Mr. Guptill, the plucky Minnesota shooter who took the highest honor in the shooting world last week."

Mr. R. D. Guptill and Mr. W. R. Randall, respectively the winner and the runner-up in the competition for the G. A. H., honors at Indianapolis last week, used Infalible powder.

New London (Ia.) Tournament.

NEW LONDON, Ia., June 17.—The ninth annual midsummer target tournament held by this club was surely a success, notwithstanding that the Illinois State tournament and a dozen others were in progress at the same time. There were several Illinois shooters here, which showed that they were not in sympathy with the Lincoln Club for setting same dates as that previously claimed by this club.

Weather hot and clear first day, and some of the shooters suffered with the heat; yet thirty-one shot through, and some good scores were made. Chas. Spencer, the St. Louis expert, laid it over Gilbert, and made 196 out of the 200. Guptil and Rambo, with 190 were high amateurs.

The invitation handicap had thirty entries, and Steege and Dr. Cook tied, each with 49. On the shoot-off Cook won his own trophy with 24. Garrett made long run, 72.

Second day opened up cloudy, and a steady shower continued well into the afternoon. When the programme was completed, the handicap had to be postponed. Gilbert came on strong and won with 194, while Guptil made another 190. John Peterson made longest run, and the well-known Waterloo, Ia., farmer came out the low man.

The shooting on the third day was tiresome, including 200 regular, the grand target handicap, the sympathy handicap, and the shoot-off for the 80 and 90 per cent. trophies.

Gilbert finished the programme high expert, with 195, Adams 189, Spencer 187; Jackson was high amateur, 194. Spencer had the experts going the first day, and with 127 straight now wears a gold ring that he may show you for the asking.

The grand target handicap brought out Dr. Winbigler, Burnside and Nichols, who tied on 49. The Doctor was shooting well and steady, and won the tie.

The trophy was a very handsome gold watch of an unusual design.

The sympathy handicap was a sharp contest, and when the smoke had cleared away it was Christman who got all but one of the 50, and landed a neat victory.

Kline got busy, and won the 90 per cent. trophy, a Marlin shotgun, with a straight score. Sperry borrowed one of the old reliable guns from the "old man," Gilbert, and by a run of 25 won out in the 80 per cent. class.

Tom Marshall fired a few shots and hastened away for the Illinois State shoot. Fine meals were served on the grounds by the ladies of the church. The new automatic trap used the second day worked very much as though it would be a "comer." Many of the shooters started off for the G. A. H.

Dr. Cook wishes it distinctly understood that his next shoot will be Oct. 18, 19 and 20, and all other clubs are notified not to encroach on his dates. The scores:

• THE PALMA TROPHY.

IN the Shooting and Fishing of June 30, an editorial embodies a letter from Gen. Bird W. Spencer, President of the National Rifle Association of America, which purports to be a reply to an editorial published in *FOREST AND STREAM* of June 18, on the Palma Trophy unpleasantness. But it is not a reply, inasmuch as it evades the issue. In our rifle columns it is published in full.

In the first paragraph of this letter, Gen. Spencer states the reason, or another reason, for equipping the United States team with two sets of rifles. He asserts that "the British Association asked us to amend the rules allowing special barrels on rifles of private makers. We did not agree to this, but as the committee of the team captains had a right to make a change in the conditions, and as H. M. Pope offered to make the barrels used, the National Rifle Association thought that it would be just as well for the team to have with them a rifle with a barrel of a private maker; and in the event that the rules were changed they would have the barrels with them for use."

"In the event that the rules were changed they would have the barrels with them for use." But the rules were not changed. How, then, did the American team come to use these special barrels? By representing that they were of a newly adopted service pattern, and so came within the rule that rifles used in a match should be "in all respects of the pattern adopted and issued to the troops for service."

The rifles had eight grooves and an eight-inch twist. Were they at the date of the match in all respects of the pattern adopted and issued to the troops for service? The answer to this is the monosyllable "No" of Col. Phipps' letter quoted in our rifle columns.

Gen. Spencer writes: "There is very little use in discussing the subject as to whether the new U. S. service rifle, adopted June 19 [1903] contained an eight or a ten-inch twist." But in his letter to the British Association of March 7, Gen. Spencer as President of the National Rifle Association, stated that the rifles used by the American team contained one turn in eight inches, the same, he is quoted as alleging, as the present service arm of the United States. Was it the same as the present service arm of the United States? Col. Phipps answers "No."

However eager Gen. Spencer may be to avoid discussing this point, its discussion is well worth while. For this reason: When, as representing the United States, because it was an international event, the National Rifle Association entered into this competition, they owed it to the people of the United States to enter it with clean hands and straight, above-board methods. The more General Spencer writes for publication, the more clearly does it appear that the American team did not enter the competition with clean hands, and that their methods were far from straightforward.

Stripped of all the irrelevant sophisms and evasions concerning what Col. Bruce, the committee of captains, the British Association, et al., did not do, and the various contingencies appertaining to things which never happened, the whole issue rests on what the team did do. Did it or did it not violate the conditions governing the match? Did it use inadmissible rifles? Even Gen. Spencer, receding from his former declaration that the rifles corresponded with the new U. S. issued service rifles, now concedes that the rifles were irregular. And he seeks to justify that irregularity on the part of the Americans by saying: "It is well known that the British team shot with a rifle made by a private maker (in no wise a Government contractor), and they were exceedingly fine rifles, and were in no sense a service rifle." Accepting this statement, and assuming that, as between the American and British teams, the illegal rifles offset each other, what then was their status, under the rules, in relation to the Canadian, Natal, French, and Norwegian and Australian teams who came into the competition with clean hands? Did those other teams qualify as contestants and still have any rights which the British and Americans were in honor and honesty bound to respect? It is, indeed, a strange code of ethics which seeks to justify a wrong by alleging, as Gen. Spencer does, that someone else has perpetrated the same wrong. Gen. Spencer is mistaken if he indulges the notion that the American people will be satisfied with any such confession and avoidance as make up his latest declaration.

As competitors for the Trophy, the American team and the National Rifle Association, and General Spencer as

its President, representing America, were charged with maintaining the good name of this country for honor and fair play. Upon them was put the obligation which rests upon the officers of our army, as expressed by Secretary Taft in his address to the graduating class at West Point the other day, when he said: "One phase in your army life I would impress upon you—never depart from the pathway of honor." It would have been the better part for the Americans at Bisley last year to have upheld the credit of America, even if they had not won the Trophy. The Palma lost to-day may be regained to-morrow. The good name forfeited may be won again only when time shall have dulled men's memory of these men and their acts.

JOHN FANNIN.

ONE after another the old-time contributors of *FOREST AND STREAM* are passing over the Great Divide, leaving behind them groups of sorrowing friends and records of good deeds well performed.

John Fannin, long Curator of the Provincial Museum at Victoria, British Columbia, died June 20, 1904. He had long been failing and growing more feeble, and the end was not unexpected.

Mr. Fannin was born in the year 1839 in the backwoods of Kempville, Ont., where he passed his boyhood. From early life he was fond of the woods and wilds, and cared more for the lessons to be learned from the book of nature than for those taught in the country schools. By the time he had attained manhood, he was not only well acquainted with the ways of the birds and beasts of his native country, but was also a good practical woodsman.

In the year 1862 came the news of the discovery of gold in the wonderful Cariboo region, which drew to northern British Columbia so many old miners and young men who were wooing fortune. One of these was Mr. Fannin, who that year joined a party which proposed to make on foot the journey across the great plains and the Rocky Mountains to the Pacific Coast. They left Fort Garry—now Winnipeg—which was then the last white settlement, and from there made their way over the vast unexplored Northwest. They crossed the Rocky Mountains at the Tete Jaune Pass, and proceeded down the west slope to a point near Fort George, on the Fraser River. The long journey had not been without dangers, difficulties, and hardships, but at last, after four months, it was safely completed, and the pioneers felt that now the fortunes that they longed for were really within their grasp.

In Mr. Fannin's judgment, the season was then too late to start in to the mines, and with five companions he proceeded to Fort Kamloops, on the Thompson River, which they reached October 11. The following spring he went to the mines, and cast in his lot with the gold seekers of Williams Creek, the richness of which made fortunes for many during the next two years. Mr. Fannin was not one of these, but nevertheless for nearly ten years he mined and prospected through the Province, coming out at last as poor as he had gone in.

All these journeyings, however, had given him a great knowledge of the Province, and on more than one occasion he was sent into the interior by the Government on exploring expeditions to acquire information on particular subjects.

About twenty-five years ago Mr. Fannin settled on the banks of the beautiful Burrard Inlet, about seven miles from the town of New Westminster. This was many years before the building of the Canadian Pacific Railroad, whose rails to-day pass almost over the spot on which Fannin's little shop and house used to stand. There were two or three other cabins near-by, and across the Inlet stood an Indian village, with whose dark-skinned inhabitants Mr. Fannin was on the best of terms. The waters swarmed with fish, and the woods with deer and grouse, while a few miles up the Inlet rose tall mountains where white goats and black bears abounded.

Mr. Fannin had always had a deep love for nature, and here he settled down and began its systematic study, though at first with little knowledge and almost without books. Here was a case of absolute self-help, for without assistance he taught himself most of the birds and mammals of the region. He was very fond of hunting, and a remarkable rifle shot; but if he hunted much, he observed more; and what he observed he remembered.

One of his closest friends was J. C. Hughes, who had long been a reader and correspondent of *FOREST AND*

STREAM, and through Mr. Hughes, more than twenty-five years ago, Mr. Fannin began to write. Subsequently some of the staff of the paper met and hunted with him, and were able to be of some little help to him. As time went on, his fame as a naturalist spread through British Columbia, and when, about sixteen years ago, the Provincial Museum was established at Victoria, Mr. Fannin was made its curator. Of the pride that he took in its collection, and the unselfish toil that he expended in increasing and perfecting them it is hardly necessary to speak. His services were heartily appreciated by the Government, which in 1895 sent him to Europe and to the United States to study the workings of modern museums.

Mr. Fannin was extremely well informed about the birds of British Columbia, and was always willing to put his great experience at the service of any bird lover. He published a list of the birds of British Columbia, and some years ago a new form of mountain sheep was named after him.

Personally Mr. Fannin was a man of the kindest nature; extremely quiet, yet with a keen wit and an appreciation of the humorous side of life which made him to those who knew him well, one of the dearest and most joyous of companions. He had a very wide acquaintance.

BIRDS AND THE ELEMENTS.

THE year from the spring of 1903 to the spring of 1904 was one of great destruction of wild birds in many portions of New England. The terrible drought of April and May of 1903 was followed by forest fires which ravished the Adirondack region, Maine, and other parts of New England, and these fires came at the height of the breeding season, and unquestionably destroyed the young of many mammals and the nests, eggs, and young of many birds. All this we have written of more than once. It has been suggested also that this terrible drought may in a number of cases have prevented certain birds, as swallows, from breeding because of the lack of mud with which to build their nests.

Early in June, however, came a change. After nearly two months, when the rainfall was far below the normal, followed a succession of rainstorms with easterly winds, fog, and low temperature, which absolutely reversed the conditions that had hitherto prevailed. In some portions of Massachusetts and Connecticut the rainfall for June was over 12 inches. In a few places it was only from 3 to 6 inches, but the average precipitation for the month in Massachusetts was 7.44 inches—greater than in any other New England State except Connecticut. These rains and the low temperature did much to destroy insect life, and so to reduce the food supply for insect-eating birds. The tremendous rainfall caused floods which overflowed the wide meadows which border many of the New England streams, drowning out all birds that had made their nests in such localities.

Details of this general bird destruction are given elsewhere in this week's *FOREST AND STREAM*. Here we have to speak chiefly of the mortality among the game. Of this the Bob White, or quail, probably suffered most. Massachusetts is near the northern limit of the bird's range, and it is frequently cut off by heavy, hard winters, necessitating a restocking, which restocking is generally done with birds from the South, which have little power of resistance to the New England winter, and so frequently in their turn succumb.

IN THE NORTH WOODS.

It is forbidden to kill deer in the Adirondacks in June.

Under such conditions, if a man in the Adirondacks in June should be mistaken for a deer, he would be safe from any hunter, because it would be unlawful for the hunter to shoot at the object thought to be a deer.

All this sounds reasonable; and it is so theoretically.

The actual fact, however, does not bear out the reasoning. Henry Prentice, a well-known character at Paul Smith's, was found dead in the woods the other day, and some time later a carpenter who works in the vicinity was arrested, and confessed that he had shot Prentice on Sunday morning, mistaking him for a deer. It is worthy of note that Prentice himself was deer hunting on this same Sunday morning.

It behooves June visitors in the Adirondacks to keep close to the hotels, and not get into the woods on a Sunday morning.

THE SPORTSMAN TOURIST

The Is-pit-si Cavalry.

WHEN the American Fur Company wound up its affairs in 1865 and retired from business, many of the firm's old employes engaged in the Indian trade for themselves, or became wolfers and beaver trappers. Fort Benton was their headquarters. Each spring from far away St. Louis came a flotilla of steamboats loaded with goods, and later departed down stream, still more heavily loaded with bales of buffalo robes and furs. All through the long, hot summer the traders and wolfers loafed about the town, gambling, drinking, and dancing—those so inclined—the more staid ones simply idling away the time and impatiently counting the days until cold weather should again bring out the prime dark fur of the buffalo, the beaver, and the wolf. And when that time came, out they scattered over the broad plains, some with bull or mule trains, some with just a wagonload of goods drawn by four horses; others with one or two good saddle horses and a few pack animals. Out into the basin of the Judith, westward along the foot of the Rockies, north to the Marias and its tributaries, or east to the Bear's Paw and Little Rockies or the valley of Milk River, they followed the Indians and the vast herds of buffalo, to trade for robes or to poison wolves and trap beavers.

It was a hazardous life they led. The traders handled mainly "fire-water," and many a one lost his life at the hands of the warriors whom he had crazed with the potent spirits. The wolfers and trappers, by ones and twos making the round of their baits and traps, and always extremely cautious, were frequently ambushed or cut off from camp by some war party of a hostile tribe, and their bones soon bleached in the bright prairie sun. Yet the rewards were so great that they unhesitatingly took the risk; better a short life with plenty of money, they reasoned, than a long life of drudgery and penury.

It was in 1871 that a new enemy appeared in the field—an enemy whom the traders learned to dread far more than they did a whole camp of drink-crazed Indians. This was one Charles Hardin, a recently appointed United States Deputy Marshal, and the first one they had ever met or heard of who could not be bribed to allow them to carry on their unlawful business. North of Fort Benton to the as yet undetermined boundary of Canada, eastward for hundreds of miles, the very heart of the game country, was Indian land, and the Government had decreed that anyone who sold liquor to an Indian or was found with it in his possession in the Indian country, should have his property confiscated, and be fined and imprisoned. And this new marshal meant to enforce the law! Of course they could have killed and thus got rid of him; but rough as these men were, used to scenes of blood and quick to anger, all and each of them were above the taking of a white man's life except in defense of their own. In other words, they had an unwritten code of honor and morals—the frontiersman's code—which they respected and religiously followed. It was not wrong to sell Indians liquor, although the Government prohibited it; but it was wrong to cheat at cards, to lie, to steal another man's woman, and above all, to take the life of a fellow white man except in strict self-defense.

Healy & Hamilton—the same John Healy who was afterwards the sheriff of Chouteau county, Montana, for so many terms, and the man who has since carved out an immense fortune in Alaskan transportation, trade, and mining—this firm was the first to hit upon a plan whereby they could circumvent the obnoxious marshal. They went over into Canada and built a trading post at the junction of the St. Mary's and Belly rivers, which they later named Fort Whoop-up, as they had an immense trade, sold great quantities of liquor to the Indians, and "generally whooped things up." True, there was always the risk of the marshal catching their northbound liquor-laden teams before they could get safely into Canada; but then, one had to run some chances in any business.

One by one the other traders followed this firm's lead, and located in what is now the southern part of the Territory of Alberta, Canada. Kipp & Thomas built Fort Kipp, at the junction of the Belly and Old Man's rivers, and Fort Standoff up the Belly River some thirty miles. T. C. Power & Bro. also built a post near Fort Kipp, which was managed by a man named Williams. Up on High River, near the foot of the Rockies, were several traders and a number of wolfers and trappers.

For a time trade could not have been better, but along in the fall of 1873 the outlook for a good winter's business was not encouraging. There seemed to be as many buffalo as ever, and plenty of other game and fur, but the Indians—the Blackfeet, Bloods and Sir-eis—had become so badly dissipated that they no longer hunted with their old time vigor and enthusiasm. Having fewer and fewer robes to trade, but an ever-increasing and unquenchable thirst, they had been selling their horses for liquor until some lodges had parted with their last animal. Becoming quite desperate, some of the wilder element of the camps had murdered several wolfers and trappers and plundered their outfits. Something had to be done; a meeting was held by the High River men and an organization formed to suppress the sale of repeating rifles—66 model Winchesters—to the Indians. A well-known firm of traders—I. G. Baker & Co.—recommended this policy, and were the first to sign an agreement pledging themselves to observe the restriction decided upon under

penalty of the confiscation of their goods. Other traders in that vicinity also signed the paper, and then it was brought down to the Belly and Kootenay River country by a deputation of wolfers for the signatures of the remaining traders. Old Harry Taylor—peace to his ashes—was the leader of the crowd. He was better known as "Kah-moos"—The Thief—a name the Blackfeet had given him.

When the agreement was presented at Whoop-up, Healy read it and then handed it back to the deputation. "I shall not sign it," he said quietly. "I am here to trade, and have a large stock of Henry rifles on hand which I shall dispose of to any who want them, Indians or white."

"Johnny," said Taylor, "don't be hasty; this is no joking matter. At our meeting up on High River it was decided that any trader who refused to sign this paper should have his goods confiscated."

Healy smiled, and there were several present who knew what that smile meant. He always smiled grimly when his ire was aroused, albeit the steely glint in his eyes belied the smile.

"Kah-moos," he replied, "when your Is-pit-si cavalry are quite ready, come down and try your confiscation plan; we'll be here to receive you."

And thus it was that the organization got its name: Is-pit-si—e-tuk-tai in Blackfoot—is High River. Healy had dubbed them the "High" cavalry.

Kipp & Thomas, John Weatherwax, and Power & Bros.' trader, Williams, signed the agreement, but the cavalry returned home without the signature of Healy & Hamilton.

One day a number of Blood Indians came into the Power's post to trade. The women were laden with bundles of well tanned prime head and tail buffalo robes, which they unslung from their backs and unrolled with sighs of relief; ten or twelve robes were a heavy burden. Among other things, three of the Indians wished to purchase each a Henry carbine and two hundred rounds of cartridges. Williams was in despair. He dared not sell them, and the thought of losing thirty-six fine robes—a clear profit of something like \$175—was almost unbearable. "Well, well," he cried, walking back and forth and ruffling his hair. "Tell them," he finally said to his interpreter, "that I can't sell them any rifles or cartridges—that none of the traders will do so—so they had better buy something else—whiskey, blankets, grub, anything but guns."

"Very well," one of the Indians replied, when the trader's decision had been made known to them. "If you will not sell us the guns, we will not trade for anything. It is not far down to the next post (Healy & Hamilton's), where we can buy what we want."

John Forgey—"Long" John, one of Williams' employes—thought he saw a way to save the trade. "I didn't sign the agreement," he said to Williams, "so the Is-pit-si cavalry can't harm me. Charge my account with the guns and cartridges, and I'll trade for the robes, and later you can give me credit for the amount."

That seemed to Williams an easy way out of the dilemma; so the Indians got the guns, purchased besides some liquor and a lot of goods, and returned home well satisfied.

In less than a week, however, Williams was visited by another deputation from High River. "We hear," said Kah-moos, "that you have broken your agreement—that you have sold three Henry guns and some cartridges to the Bloods. How is it?"

"You are mistaken," Williams replied. "I have not sold a rifle, nor cartridges, either, to anyone since you were last here."

"But the Bloods have three new guns, which they say they purchased from you. How do you account for that?"

Before Williams could answer, Long John produced the ledger, opened at his account: "You will see," he said, pointing to the particular item, "that I am charged with three carbines and six hundred cartridges. Well, I sold them to the Bloods. I was not included in your agreement; I did not sign it, and I had a right to do so."

The members of the cavalry drew a little apart and discussed the case, and finally informed Williams that they considered him responsible for the actions of his employee. "Therefore," the leader concluded, "we contend that you have forfeited your goods. We will be down again to-morrow evening with our wagons and haul them away. In the meantime, be sure you don't cache anything; if you do, you may expect pretty rough treatment."

Williams was fairly distracted. After the cavalry rode away, he walked up and down the trade room, wringing his hands and bemoaning the fate which had enticed him into such a wild country and among such lawless men. "I have never liked the business," he said to Long John, "and I cannot stand it another hour. You may consider yourself in full charge here, for I am going to saddle my horse and start for Fort Benton at once."

Forgey refused to assume the responsibility, and suggested that if Williams really intended to leave, he had better try to get Healy to take charge until the firm could send someone out from Fort Benton. Williams agreed to this, and losing no time in saddling his horse, he started at once for Fort Benton, via Whoop-up, where he succeeded in getting Healy to take charge of the post. The firm dealt largely with T. C. Power & Bro., and Healy felt under obligations to help them out of a tight place.

Moreover, Healy was longing for a chance to meet the men who seemed to be running the country regardless of law or justice. He tried first, however, to induce Williams to return to his post, pointing out that it was the height of cowardice for a man to so abandon the important position his employers had given him. Williams would not listen to arguments nor reason, and suddenly realizing that he would likely be waylaid by a war party on the trail south, begged to be allowed to remain at Whoop-up until he could join some outfit going in.

"No, sir," Healy replied. "You either return to your place or you hit the trail out of here in five minutes. This post shelters no cowards."

So Williams went on south, and, to every one's surprise, he arrived safely at Fort Benton, not even seeing an Indian on the way. From Benton he took passage in a mackinaw for the "States," and never returned; the frontier was not the place for such as he.

Long John and the interpreter passed a restless evening and night, but early the next morning Healy drove up to the post and in his wagon was one of the Whoop-up guns—a mounted six-pounder brass cannon. There were a number of employes at Fort Whoop-up, but not one of them had accompanied him. Long John wondered what was to be the plan of defense, but he asked no questions as he helped unhitch the team and unload the cannon.

On each side of the trade room was a store room, one of which was still empty, as the winter's trade had but just commenced. Along the back wall of the empty one Healy and John built a bench, full length of the room, and this was the only article of furniture in it; one or two empty boxes, and anything else that would answer for a seat were taken out. The cannon was then heavily charged with a sackful of trade balls on top of the well rammed powder, and run in behind the high counter, and a hole of the proper size and height was cut in the partition, which allowed the gun to be trained so as to command the length of the bench. The hole was then covered with an old coat, carelessly hung over it.

"Sacre!" the interpreter exclaimed. "But it ees ze beautiful scheme; wiz one shot ze Is-pet-se cavalree will be potted, an' as ze dam Pied Noirs say, 'ak' ahk-si in-mot-stan'—eet will one gran' clean up be."

Long John was a youth in those days—a mere boy fresh from a peaceful Nebraska farm, and his eyes fairly bulged when he comprehended Healy's plan. "Mr. Healy, are you going to get those men to sit on that bench and then shoot that sackful of balls into 'em?" he asked.

"I am," Healy replied, "unless I can argue them out of attempting to loot this place. After I get them into the room and seated on the bench you are going to stand by the cannon, and if you hear me say, or begin to say, this sentence—'Gentlemen, since you will not listen to reason, you must take the consequences'—if you hear me begin that, you are to pull the string I have attached to the fuse, and fire the cannon. Do you savey?"

"Yes, sir," John replied, "I savey, and I'll sure pull the string. These here Is-pit-si cavalry are nothing but a gang of robbers, and they ought to be blown up."

"Right you are, boy; they're robbers, all right; yet, to do them justice, we must concede that they believe—really believe—they are doing the best thing they can to insure their safety."

About four o'clock the crowd arrived—twenty of them—some on horseback, some driving four-horse teams. It was easy to see that they were surprised and somewhat taken aback to find Healy in charge of the place, and to learn that Williams had left the country. It was a raw, cloudy day, and Healy invited them into the empty room, where a bright fire was burning in the open chimney-place.

"Well, boys," said he, "even if we do differ about some things, there is no reason why we should not have a little drink together, is there?" and he brought out a keg and a cup, which were passed around. One by one each man poured out what liquor he wanted, solemnly said, "How!" and swallowed it. And gradually, one by one, after warming before the fire-place, they naturally sauntered across the room and sat down on the long bench.

Then Healy began to talk, walking up and down before them, stopping now and then to emphasize a point in his argument. His main contention was that the very firm which had proposed the restriction in trading firearms and cartridges were taking robes and furs for them right along and giving the Indians orders on their southern post for the weapons, and that if an Indian really wanted a gun or cartridges, he did not mind a two hundred mile ride after them. Then he appealed to their pride. "You are all old-timers," he said. "You have roamed these western plains for years, and beat the Indians at their own game when they were as bad, and worse, than they are now, when more and better armed war parties were abroad. And are you going to have it said of you at this late day that you dared not go out to wolf and trap until you had bulldozed the traders and stopped the sale of arms to the Indians?"

"And if you should succeed in enforcing this restriction out here, and confiscate the goods in this post, what would your friends in Fort Benton think of you? Would you have any friends left there? Not one of you but has some time or other gone to the owners of these goods and purchased what you wanted from them on credit; many of you to-day owe the firm for your winter's outfit; they

have been good and liberal, and would you now repay their kindness by robbing them? As a friend, I beg you to consider this matter seriously; you have considered it from your point of view, now look at it from the other side."

He stopped speaking, and for a moment there was silence in the room. The interpreter, who had been standing in the doorway between the two rooms, softly stole out, a scared and trembling Frenchman. Long John stood grimly beside the cannon; his heart was beating furiously, and there was a choking sensation in his throat; he felt dizzy and faint, as he waited to hear the dreaded signal to fire the piece.

Old Kah-moos was the first to break the silence. "Out

FLORIDA COWBOYS.

of consideration to Power & Bro., fellows, I move that we overlook this matter and go home; giving fair warning, however, to those present and absent that we will not overlook another offense of the kind."

The others quickly agreed to this, and the keg again went the rounds, pipes were lit, conversation became general. As the crowd arose to depart, Healy asked them to step into the trade room and look behind the counter; they did so, and what they saw there caused them to look very solemn and thoughtful. They hadn't a word to say as they passed out and prepared to ride and drive away. Finally, however, Kah-moos burst out: "Johnny, old man, if we had refused to drop the matter, would that old cannon really have mowed us down, or was that a bluff you was runnin' in on us?"

"Ask Long John," he replied.

"I was just waitin' to hear him say the word," said John, "and then I was to touch her off."

Kah-moos dug the spurs into his horse, and away the party went. And that was the end of the Is-pit-si cavalry.

O'-MUK-E-TAI.

Florida Water Ways in Summer.

Up North River.

ST. AUGUSTINE, Florida, June 21.—The ordinary tourist thinks of Florida summertime as likely to be too hot for endurance, and this because he finds March so lovely and warm, and thinks to himself and says to everybody he meets, "If it is so warm in March, how hot must it be in June?" So figuring out the future by this rule of three, he hies himself home to frost and mud and all things disagreeable, instead of remaining through the balmy months of spring and early summer, to find the cool sea breeze

AFTER CRABS.

temper the air to a most delightful freshness, and to make sailing and bathing one long delight.

In any of these days take a sailboat, with tent and camping outfit, simple or elaborate as you may choose. You can be perfectly comfortable with the most simple, or you can luxuriate in the most elaborate. Your colored skipper will be both captain, mate, crew and cook, all in one; and you can sail away any fine morning certain of a good time, only to be measured by ones temperament and desires, for there will be no limit to opportunity. After carefully going over the cargo to see that nothing of camp equipage or of provisions or cooking utensils or tackle have been left behind, following more or less closely Hallock's list as to provisions (look up the old book), if you sail up North River, you will leave the

wharf with all sail spread, and soon the city and Fort Marion are left behind. Passing Grass Island as you turn into North River from the Matanzas, you leave at your right a reminder of the olden days in the battery on North Beach, from which Oglethorpe bombarded the fort in 1740. From this point, if you have been careful to time your trip with a favoring tide, it is all plain sailing, and passing Burton's Island you get a glimpse of the site of Fort Moosa, the outpost of old St. Augustine, from whence the alarm of an expected attack was sent to the garrison at the fort. On the other side of the river runs the long, narrow peninsula of the North Beach.

The result of the effort through legislation for the protection of birds of plumage is already apparent in the number of the great blue herons and the white egrets that rise from the marsh as we go sailing by, while many remain standing along the edge at their usual occupation of fish catching, refusing to be disturbed. Overhead the osprey sails back from his trip to the ocean with his dinner of fish in his talons. These birds must have a nice sense of taste, otherwise why should they fly across a river wriggling with fish, and fly sometimes for miles to reach the ocean before swooping down upon their prey? They may be real epicures, and disdain the sometimes muddy flavor of fish caught outside the sea.

So it may be a couple of hours have passed and we have sailed by the old plantation known as "Casa Cola," which, being translated, means the end house, as marking in the old time the limit of settlement, and at Sanchez Point come to where the river divides into two branches, one retaining the name North River, and the other Guano Creek, running nearly parallel to each other for many miles.

In the beautiful woods that cover a large extent of this territory may still be found some of the olive trees that flourished here when this, too, was a plantation of the olden time.

Two miles further sailing along the river, here heavily wooded to the water's edge with live and water oaks and cedar, with here and there a tall pine lifting its head high above its neighbors, we come to Shell Bluff, the house of Mr. Sabbate, sometimes occupied, then for long

CAMP WEBB.

months vacant. The house stands on the summit of a shell heap, one of those ancient dwelling places of which there are so many all along the Florida coast, and which may have been the dwelling place of men five thousand years ago.

The landscape has little changed since then, and standing now on its summit you look to the westward over the river and over the marsh beyond to the pine forest stretching itself away mile after mile. At the edge of the river, just opposite to where you are standing, is the house of the old hunter, Jim Ponce, whom I have seen cantering through the woods with the hounds in full cry after a deer, and his double-barreled muzzleloading gun at full cock lying across his saddle in front of him. He never touched the gun until his reckless pace brought him within shooting distance of the deer, and then apparently one motion stopped his horse and brought the gun to his shoulder, generally with fatal effect so far as the deer was concerned.

After our short and pleasant call on the folks at the Shell Bluff, still having ten miles to go, and anxious to keep on the rising tide, we sail away for the head of the river, where we expect to camp. We are quite careful now, as our skipper is not familiar with this upper part of the river, and banks which are often in the middle of the broad river are to be avoided. Of course, on a rising tide it is not so serious a matter as to run on one with a falling tide. But then there is more or less delay in any event, so a careful lookout is kept from the bow, and nothing more serious happens than the occasional touching bottom by the centerboard, which gives timely warning, and also tells the way out. As we sail away from Sabbate's, Piney Island looms in the distance five miles away, and we know we must sail around it, for it is really a peninsula. With a broad river and a tide still rising, we have little trouble in keeping clear of sandbanks. We make good time to and around Piney Island, and then some miles ahead see the thicket known as Cook's Hammock, and know that a few miles beyond that is the site for the camp.

With a good broad water almost to the head of this arm of the sea known as a river, we pitch our camp as evening shadows fall, and with plenty of wood for both fire and light, cook our evening meal. In such a camp and by such a fire, as nowhere else, can all the luxurious

repast known as "hog and hominy" with coffee, be thoroughly appreciated.

Here, with deep water coming up so near that bathing, fishing, and crabbing and oyster gathering are all well within the effort of even the most pronounced idler, the days of the camp pass, with excursions through wood paths and along old but little worn roads to the site of Fort Diego of the early days of Florida's settlement, and to Indian mounds, the remains of a far earlier habitation.

A punt with a pole gave us the opportunity to explore the river to its very head, and on this excursion we had the opportunity not often given of securing the picture of

SABBATE'S COTTAGE ON THE OLD SHELL BLUFF.

a herd of cattle being driven across the river by a number of cattlemen.

We were poling the punt up the headwaters of the river beyond the camp toward the bridge, when through the woods we saw an occasional horseman, and knew by the pistol-like cracking of the bullwhips that a round-up was close at hand. And sure enough, we soon heard the shouting, mingled with the cracking of the whips, as the cattle came out of the woods and plunged into the river, with the nine horsemen in rear and on either flank to keep them going, for in the deepest part of the river they had to swim. While we poled so as to aid the horsemen, we took several snap shots, one of which is shown with a group of the cattle and the horsemen in the distance.

After the cattle and horsemen had crossed the river, we poled on and passed under the bridge with but a scant space above us, although we bent close to the rail of the boat, and we poled on until we reached the very head of the river, the interlacing branches barring our further progress.

On our return to camp, the first exciting incident of the trip occurred, when Harry, as we approached the shore, in attempting to haul the boat to land by grasping an overhanging branch, and the twig giving way, suddenly disappeared in fifteen feet of water, leaving a hat floating as a reminder of his going down. He, however, reappeared; none the worse for a dipping, and was soon ashore with the rest of us.

Mr. S., to whom we are indebted for most of the pictures which illustrate this article, is an accomplished amateur in photography, and also an adept in making things comfortable about the camp, having been a camper-cut since boyhood; and this leads to just one word of moralizing. Let no one go on a camping trip who does

OUR YACHT AT CAMP LANDING.

not love it, or to whom it may possibly become a bore. Such a one inevitably affects the whole camp. But when everybody, skippers and all, are thoroughly in love with the life while it lasts, then for recreation, in its full sense and significance, there is nothing that can compare with it. It is well to take some literature with you, but it is hardly ever opened, as one finds little time for reading.

And so the days went by, until one morning found us with tent struck and put away on board, a hearty breakfast eaten, the smouldering embers of the camp-fire carefully extinguished, and the tide just at top of the flood, the sail was hoisted, and with a favoring tide we started on our homeward voyage. The wind was light but fair, and we gaily floated along with our westerly breeze growing lighter and lighter, until we reached the neighborhood

of Piney Island, when, the wind dying out, we drifted on a bar at the north of a marsh creek, and Harry and I were obliged to rig ourselves in Seminole costume and jump overboard and push the craft over the bar. Just then the wind shifted, coming out of the southeast, and we were able once more to get over the bar and into the river. We thought our trouble over, and donned our discarded clothing, but were scarcely abreast of Piney Island when we again ran aground, and again hastily assumed the Seminole costume and plunged overboard. Now, all who have tried it know the difference between running on a bank with a rising tide and trying the same involuntary experiment with a falling tide. The tide was rapidly falling, and we worked very quickly and got her off, but concluded to remain in Seminole garb (see Florida Guide Book) until we were sure we had passed the last sandbank likely to catch us. This experience was repeated five times, until, as we reached the familiar waters near Sabbate's shell bluff, we again appeared in civilized attire.

Our stop was brief at this place, so interesting to the archæologist, for from this shell heap an old trail leads across the peninsula to Guano Creek, and to a shell heap there, and then from the other side of that water a trail to two very high sand hills and thence to the ocean. It must also have been almost at this very point of the ocean beach that Ponce de Leon touched before going southward, and entering the harbor of the "Holy Cross," St. Augustine.

We had as one of the party the boy who asks questions, and it is always a good thing to have such a boy along, for a man otherwise is prone to forget those days of his youth when he himself was in the question asking age. The questions that do not occur to the ordinary boy are few, and I for one am glad they ask them, even if sometimes they seem somewhat irrelevant.

Our homeward trip was henceforth uneventful, but head winds delayed us until we met a rising tide to still further delay, so that our homeward trip was about three times as long in time as our outgoing. But we were in no hurry to bring so pleasant a voyage to a close.

We hark back to the nomadic life of our ancestors none too often in this strenuous age. It affords the best of all mental rests, and gives us again of that simpler life lived close to Nature and her heart.

Let us once in a while still listen to the "Call of the Wild." It will do us good. No one felt the force of this more than the editor, who couldn't go, having already stretched his vacation to the utmost, so he said. If this account gives him another twinge, we won't mind.

W.

A Summer in Newfoundland.—III.

(Continued from page 5)

It was a good six hours' tramp to the first pool, between high precipitous walls, over sharp, jagged rocks and moss-covered boulders; but by noon rods were again jointed, while the guides put up the tent, and John boiled the kettle. A Newfoundland never can be healthy or happy without he "biles de kettle" at every favorable opportunity. To him strong, bitter tea is a greater necessity than either bread or pork, and I have known old Jim to walk over forty miles rather than miss this beverage for the short period of five days at the end of a trip.

Lunch over, I smoked my head for a few moments over a moss smudge to dispel the last traces of a black fly, before adjusting the cheese cloth contrivance which fitted down over my cap. "De flies be cross," remarked William, but he had hardly finished the sentence, when a great splash down in the pool sent waves rippling and chasing each other over its surface, and we knew that a good sized salmon had leaped from the water. Dugmore ran for his camera, while I seized my rod, and wading in knee-deep, cast out into the current a small silver-doctor and a medium sized Jock-Scott. Twenty minutes without a rise; then another splash at the opposite end of the pool, and a bright, fresh-run fish leaped five feet clear of the water. I hastily changed my base of operations, and a few moments later he rose to the Jock-Scott—the first rise of the season. It was not the quick, savage rush of a trout or ouananiche, but the broad back and high dorsal fin slowly arched above the surface as he missed my fly by nearly a foot. Strange, is it not, that big salmon have such small bumps of locality? It is, however, a failing common to the species, and time and again I have killed a fish which previously had missed my flies several times by broad margins.

There are two different methods which anglers pursue after a salmon has struck at and missed the cast. One is to keep right on whipping the pool with increasing speed and vigor; another more conservative plan is to wait a bit and give the big fellow a chance to settle down and compose himself after his first failure. For no matter how delicate the leader, no matter how small the hook, or how deftly the latter is dropped upon the water, a heavy salmon will often wait ten or even fifteen minutes, or perhaps all day, before making a second attempt. In my experience the waiting method has proved the more successful; and accordingly I sat impatiently on a rock for a period which seemed fully ten minutes, although it was only four, all the while reproaching myself for striking so hastily at the first rise. For hooking a salmon, especially if the water be swift, is a very different matter from snubbing a trout or black bass. In fact, the former frequently hooks himself with no aid whatever from the angler; and it is very difficult for a trout fisherman to moderate his sudden strike, or refrain from quickly jerking his rod as the great silvery fish rolls over the flies. So, keeping this in mind, I waded again into the stream and cast out from shore. He rose with that same slow motion, and sucking in my fly beneath the surface, hooked himself—this time with a sharp tug at the doctor.

No man on paper ever did full justice to a salmon's powers, to his long rushes, and wild, erratic leaps. It was just forty-six minutes, one after another, of such thrilling movements as Henry Van Dyke so graphically describes in "Fisherman's Luck," with the big ouananiche at Grande Décharge. Dugmore, his face glued to the finder of the big-Graflex, was all around the pool at once, pressing the button at each critical moment as the fish leaped in the air. The latter we could plainly see in the

shallow pool, tail up, head down, slowly working back and forth, to and fro, among the rocks on bottom, vainly searching out some protecting cranny or sharp ledge on which to cut the leader. Every few moments a feeling of dreadful uncertainty would seize me as the fish shook his body rapidly from side to side in his efforts to tear out the hook. Those quick pulsating tugs at the line, known to angling lore as "jigging," are familiar to all salmon fishermen; with me they always produce a momentary feeling of paralysis around the heart. But that little No. 6 silver-doctor held well, and now those well known symptoms of exhaustion marked a fate that was soon to be sealed. His body rolled unsteadily, often belly upward in the water, his sharp dorsal fin cut the surface, and the broad tail flapped weakly enough as I reeled him in, and a moment later Jim's gaff threw him far up among the rocks on shore. It was the first salmon of the season, an even 10-pounder, and the whole party joined in mutual congratulations.

That was a good day, that first afternoon among the upper pools. I killed another slightly smaller in the steady water, and later my friend took two good sized fish in the pool above, while I snapped the camera at him. Another wise old fellow jumped clear of the brook, and up among the stones on shore, only to flounder back and escape, while a sixth, a heavy fish, tore down stream like a runaway locomotive, snapped my leader around a rock, and then rushed back, jumping several times with the hook still fast in his jaw.

Halcyon days were those among the upper pools. Warblers and titmice twittered among the spruces by day, and mosquitoes hummed us to sleep in the tent by night, but salmon were there in the brook only ten yards from camp; not many, 'tis true, for the latter still proved discouragingly low, but our score for the rest of the week was sixteen, and we were satisfied.

Every stream in Newfoundland—or, for that matter, in every land—is constantly changing from year to year, from month to month, even from day to day. The floods and freshets of early spring leave deep and lasting footprints in a river bed, in the sand and gravel of the bottom, in the contour of the beach, even high up on shore among bushes and tree trunks. Rocky points are torn away bodily and piled in confusion, as "gurry," and logs and huge ice cakes go crashing down the swollen torrent. Big boulders mysteriously change their positions from year to year; sandbars are often scooped up entire and deposited perhaps in some favorite pool, where every summer salmon have been lurking for generations past. And what of the salmon? Why, perchance, they have discovered a new and better pool, only a few rods further up, where they will lie each season for generations to come, just as contentedly as in the old home, now covered by an avalanche of sand and stones.

Three or four miles above camp, this is precisely what we found—a new pool in the shape of a circular basin, broad and shallow, scooped from the very river bed itself by the ice of previous spring freshets. It was well stocked with salmon, but so clear and transparent that only an odd one could be induced to strike; and, strange as it may seem, our luck was best during the midday hours. For four consecutive days not a fish rose before ten o'clock in the morning, and then merely in a half-hearted, listless way, only after endless casting and an infinite variety of flies had been tried. Of the latter, I trailed at least a dozen past the nose of one indifferent fish, finally inducing him to take the most unlikely one of all—a professor. At another time, after working for an hour over a reluctant salmon, he finally rose with a great swirl to a little Jock-Scott—the very fly with which I had started. A bright yellow-miller killed a good fish for Dugmore after the standard silver-doctor had been refused at least fifty times; and yet I am sure that not one in a thousand preferred a miller to a doctor or a black-dose or half a dozen others. Strange, is it not, that salmon are so peculiar in their moods and appetites? It almost seemed as if they rose more out of sheer spite than for any other reason; or perhaps it was just to get rid of us—rid of those odd little flies that skipped so boldly and tantalizingly over the glassy surface.

At the lower end of this new pool, called, in honor of its discoverer, William's Pool, was a rocky cove, and in the center of this cove a small fish of perhaps six pounds' weight lurked in the shadow of a flat rock. Every morning he was at his post; regularly he rose with no uncertain intent, and, feeling the prick of the hook, beat a hasty retreat to his rock. This continued for four mornings in succession; but that fish's life seemed to be guarded by a divine providence, for every time he escaped. Once he missed the fly entirely, and remained absolutely indifferent for the rest of the day; twice he was slightly pricked, and yet a fourth time he retired from the fray, leaving me minus a little No. 8 dusty-miller. Each time he appeared as eager as ever for the fly, and seemed to have completely forgotten the experience of the previous day; but finally, just as we were about to leave, I hooked the wily fish. Fast to a No. 8 silver-doctor, with a four-ounce trout rod at the other end, it seemed at least like a thirty-minute proposition, for the grilse was as gamy and acrobatic as any in the river. Small salmon are always more active jumpers than heavy fish, and this one proved no exception to the rule. I counted seven genuine leaps, and as many splashes on the surface, but then, in a final desperate rush, my grilse did something which salmon rarely attempt in the shallower Newfoundland rivers. It was a master move, a well planned strategy worthy of success, and it certainly deserved a fate nobler than that offered by the hot fat of a frying-pan. Leaping a sharp ledge of rock at the outlet of the pool, and then plunging down a slight fall, he wriggled along among the scattered boulders of a shoal, and finally gaining steady water, deliberately swam under a projecting bank, where, of course, the line caught in an overhanging alder and the hook tore loose. The maneuver had succeeded, and my grilse had escaped, for now the cast hung helplessly tangled in the bushes. So I reeled up my line and walked over to the alders for the purpose of detaching the flies; but on peering down, imagine my surprise to see Mr. Grilse calmly lying in the water, with his head poked in under the bank. He was still free, although in hiding, but a moment later Jim's gaff surprised him most unpleasantly.

Half a mile above camp, about thirty fish waited for

rain in the deep, dark waters of the Black Pool. I caught several on different days, but there was one of unusual interest, the largest of all, a veritable patriarch among salmon, that eluded all my efforts. Every day I used to watch him from the top of an overhanging boulder, always at his post lying far down among its black shadows. That fish had evidently run very early in the season, for his back was dark, and his sides a golden brown, while a broad crescent-shaped gash back of the head showed where a spear had struck and failed to kill. But all the wiles known to the gentle art, and all the flies in my book, were tried without success. Neither the feminine brilliancy of a Parmachenee-belle, nor the profound learning of a professor, nor the mystic charm of the infallible Jock-Scott, affected in the slightest degree his stolid indifference and candor. He was an educated fish, a fish possessing the discrimination born of a past experience, and only once, toward sundown, did he condescend to follow my fly, leaving a broad ripple in his wake. But it was merely a playful frolic, or perhaps he was making game of me. So at last, after four days of failure, I determined to try a bait. It was contrary to all angling traditions, and directly opposed to the experience of many experts, who tell us that a salmon will not eat in fresh water, but merely subsists upon his own fat, accumulated in salt water. Dr. Francis Day and other famous anglers have advanced the theory that a salmon rises to the fly merely through impulses of anger or in play. This theory certainly looks very plausible when, upon opening the fish, we usually find its stomach as empty as a pocket; and they always lose several pounds in weight after a few months' visit in fresh water. How can thirty or forty great salmon find sufficient sustenance for two or three weeks or even longer in a small, narrow pool not over four feet deep? Many facts seem to uphold the theory, but nevertheless there is nothing in it that would prevent a hungry fish from seizing a tempting bait if dangled before his nose. At the Grande Décharge, on the headwaters of the Saguenay, the ouananiche, a fish barely distinguishable from the sea salmon, will take a cricket or grasshopper with the utmost relish; and it has long been well known that the salmon of European waters often stoops to a baited hook.

So a small piece of trout was accordingly placed on a plain bare hook, and allowed to drift down with the current below the surface. Whirling around and around among the eddies, it safely passed the nose of my old friend, but a moment later, to my utter astonishment, the dainty morsel was eagerly seized by a 7-pounder, and the hook held. Later that fish paid the penalty of his indiscretion. Again and again I tried the experiment without success; but for once the theory was upset, and one fish in that pool, at least, fed in fresh water.

Since writing the above, the following letter appeared in FOREST AND STREAM, written by Mr. W. F. J. McCormick, of Biscayne Bay, Florida, a sportsman of broad knowledge and experience: "One thing I have learned conclusively and positively, and that is, that *Salmo salar*, the delicate aristocrat of the river, will stoop to bite at the plebeian worm, a piece of fish, or common pork. I took a 12-pound fresh-run fish on a bunch of worms, stood by and saw a 21-pounder killed with the same, and last Sunday I took an 8-pound grilse on a piece of pork. Does not that upset the pet theory of their refusing food in fresh water?" At the time Mr. McCormick was fishing in Newfoundland.

It would be a great pity for the bait-fisherman, with his "plebeian worms" and servile pork, to degrade the noble sport of fly-casting for salmon; and I sincerely hope that in the future no one will be more successful than were we, and that no trout or pork or grub or worm will ever again induce a salmon to rise in fresh water.

It was now high time to be starting for the interior and the falls. My friend had already departed, and was speeding along the rails toward the great land to the southward. The fishing season was nearing its close, for already salmon and grilse were commencing to change from a brilliant silver to a dark golden hue. Even the feathered songsters around camp realized the waning of summer, for their early morning choruses had ceased, and the birds now skulked furtively among the bushes awaiting the passing of the August moult. For truly August is a silent season among the song birds—a season of ill luck and weaknesses; of silent, solitary moping, only too often resulting in sickness or in death. During that brief period there is no surplus vitality for idle song; all their strength and vigor are required, for it is then that the old coat is discarded for a newer dress, another set of quills and pinions to be used on that long southern journey among the perils and dangers of the fall migration. So with some reluctance we left the big salmon still at his post among the shadows of the Black Pool, and shouldering our packs, started off on a three days' journey to the headwaters of the river—and the falls.

The Grand Fall is situated in the most delightful spot in which it has ever been my good fortune to pitch a camp. In the very center of a deep amphitheatre among surrounding hills, confined on all sides by almost perpendicular granite walls, the river winds tortuously through the narrow chasm, and then plunges in a cataract of foam and spray forty feet into a pool below. Here the waters, deep and black, swirl in great eddies between two parallel walls of rock.

About two o'clock on the afternoon of the third day, we wearily climbed the last hill below the falls, struggled through a mile or two of the thickest spruce tangle that ever tried a traveler's patience, and three hours later rested on the high boulders by the river's brink. Yes, salmon were there—a few, at any rate—down in the depths below; for almost immediately a doughty little grilse, springing into the air, launched himself ten feet up into the foam, and then fell back into the pool beneath us. From our elevated position he seemed small and slender, indeed, far too insignificant for such a task, but his failure was only the signal for another and yet another unsuccessfully to try the ascent. It proved too great an effort even for the prowess of a full-grown salmon, and during the next half hour several big fellows were washed down ignominiously among the rocks below whirled backward by tons of falling water. It was a plucky leap out into that torrent, that boiling cauldron of foam and spray, and must have sorely tried even a fish's nerves; but, nothing daunted, many of all sizes

ed to stem the flood, and not one succeeded. Accord-
Jim, no salmon in past times had ever achieved the
ction of ascending to the placid pools above, but
made little difference to the salmon, for all previous
res seemed to have been forgotten, or even inspired
to greater efforts to mount higher and yet higher in
search for better spawning grounds. Those fish
impelled by instincts which are strong—the instincts
thousand years—to stem the current regardless of
sequences, to push constantly onward and upward
ugh the perils of rapid and net and shoal alike, to
out the purest, clearest springs among the far away
sources. The whole scene was one dear to the heart
angler. It reminded me of the Grande Décharge of
St. John, where the mighty floods of the Mistassini,
Rapmouchouan and Peribonca pour down into the
re Saguenay. Only it was pictured on a smaller
less noisily boisterous, but far more refined in its
seclusion; an ideal spot for a solitary fisherman, and
e retreat for a hundred weary salmon.

oroughly tired after our long tramp across the hills,
was accomplished that first afternoon except pitch-
the tent a few yards from the pool, and placing a
e of spruce trunks across the stream some distance
to serve as a rude bridge. A combined dinner and
er was nearly ready; one kettle filled to the brim with
ad just commenced to bubble, while from under the
f another larger one exhaled the savory odors of a
stew. A side of smoked salmon impaled on a
r sizzled a few feet above the blaze, while off at one
the frying-pan, resting on a bed of embers, did its
to brown some slices of corn-meal mush. It was a
l repast for a hungry man, and we had just com-
ed to partake, when a sudden shrill scream echoed
somewhere along the face of the cliff, and a great
launched himself from a projecting crag, and with
ous flappings of his wings soared straight for camp.
circled around and around above our heads, I
distinguish the black cap and glossy blue back of a
b adult goshawk (*Accipiter atricapillus*), that rare,
e bird of falconry. Soon the more powerful female
her mate from another quarter, and together,
ping and darting past our faces, they awoke the
s of the mountains with angry screamings. Rarely
I witnessed such a display of bold daring in a bird,
ard such wild discordant cries. The big, clumsy
s are worried when their nest is approached, but
create a spectacle at very close range. Even the
courageous sparrow hawk, with his shrill *killy*,
killy, keeps at a respectful distance. But on a warm
evening just walk out into the orchard and stand
the old apple tree where the little screech owl has
ood, and you will feel the breath of his wings, and
ance score a scratch or so to boot. He utters no
ing note, no hoarse cries or rasping screams, but he
s swiftly and silently from among the black
ws. One spring evening some years ago a professor
walking contentedly along McCosh walk on the
eton campus with a lighted cigar held between his
when one of these birds suddenly swooped at the
knocking the latter to the pavement, while the
y professor quickened his steps in hasty retreat.
this hypothesis was advanced, and from it a theory
deduced: namely, that the light looked like a fire-
nd consequently that the joke was on the owl, not
e professor. But if they had known that a small
y, not ten yards away, contained four downy nest-
perhaps the laugh might have rung the other way,
erchance the wise old owl chuckled softly to herself.
at pair of goshawks had a nest a short distance
camp. It was concealed in a little niche on the
ndicular face of the cliff, with a sheer drop of a
and feet below it. Of course I did not attempt the
t, as it was impregnable; but I climbed within a
e of hundred feet, and could see two well grown
g perched on the rocks. A day or two later they
a lesson in flying, and from that time until our de-
re from the falls there was hardly a morning when
dult birds did not spend an hour swooping past the
and heaping maledictions upon the heads of the
ge beings who had invaded their domains.

WM. ARTHUR BABSON.

[TO BE CONTINUED.]

The Value of Vacations.

ILADELPHIA, Pa.—*Editor Forest and Stream:* Your
ial in *FOREST AND STREAM* of July 2, entitled, "Rus-
Sage on Vacations," was enjoyed by me with keen
est, and I presume it was equally enjoyed by all
of your readers, for I do not believe that there is
f their number who believes that the true and total
of life consists in an incessant, exclusive struggle
ollars. To become a figure of national eminence as a
stent hoarder of money is not necessarily to become
ample for anyone to follow in the proper ideals of

u mention that, in his article on the "Injustice of
ions," he wrote: "During the eighty-eight years of
areer, I have not once taken a vacation. I have
been an advocate of what some term the 'vacation
' When I was a boy, the practice was not in vogue."
ght be observed that many other practices—such as
millionaire habit—were not in vogue eighty years ago,
ell as several sharp habits of finance which obtain
e present day, but as they rather favor Mr. Sage's
ial interests, he does not denounce them.

e attitude of Mr. Sage in the matter of vacations is
without its pathos. He is an extremely aged man,
ulti-millionaire, possessing wealth far beyond his
even if he lived a life of unbounded royal luxury.
a insatiable craving for money for its own sake, and
abits of mind and body fixed by the efforts of a
ne, he has come to believe sincerely that a vacation
e necessary, and that it is besides an injustice to the
yer whose employes take, or are given, a vacation.

the strictly materialistic and utilitarian point of
of Mr. Sage, he is in error. Let us examine what
vacation habit has directly and indirectly created.
e are in evidence the magnificent summer resorts in
orth, and the magnificent winter resorts of Florida
California and other places. Note the elaborate ar-
ments which the great railroads make to carry sum-

mer tourists, and much of those railroad earnings goes
into Mr. Sage's coffers. Note the mammoth ocean
steamers, known as "floating palaces," which are made
possible by the patronage of the tourists who are afflicted
with the vacation habit, and we have an example of the
world's progress, and a source whence comes a revenue
to cancel coupons stacked up in Mr. Sage's strong boxes.
To build those railroads, those palace cars, those floating
palaces, material was bought and workmen paid, and
therefore the money of those afflicted with the "vacation
habit" was put in circulation and conveyed prosperity and
pleasure to society at large. Moreover, it made possible
the payment of interest on money borrowed, which came
in welcome response to money loaned, which came in
unison with the life work and theme of Mr. Sage.

But there are other considerations than mere business
profits. Observe the color of returned health, the vivacity
of mind, the energy and courage of mind and body which
are a corollary of vigorous physical powers, displayed by
those who have had a proper vacation. After a vacation,
a man is a better workman and renders infinitely better
service to his employer due to consequent better physical
and mental condition, so that the short loss of time is
more than counterbalanced by the months of greater effi-
ciency. All people have not the iron constitution and
endurance of Mr. Sage, nor have all people the relentless
purpose of money-getting which leads one on in business
like to a famished wolf in pursuit of prey.

Throughout the ages, nature has indicated the need of
rest. Even the inanimate land must lie fallow betimes,
else it produces meagerly—that is taking a vaca-
tion. Even in ancient days, and in Scriptural days,
also, the seventh day, besides being devoted to worship,
was designated as a day of rest. It has been the best
judgment of the most enlightened nations that periods of
long exertion should be followed by a period of relaxa-
tion. In modern times the strain on mind and body is
greater than was ever known in the world's history. It is
an age of specialization. Men must know more and work
more than they did when Mr. Sage was a boy; hence the
conditions which were good eighty-eight years ago may
not be good now. Few of us would care now to wear
the hats and shoes of our great grandfathers.

On other matters the world has agreed from time im-
memorial. The school readers without fail have brief
stories of the miser's despicable nature. He is held up as
the superlative of all that is sordid and selfish. The plays
of a people heap contumely on a Shylock. The man
who preys on the industry or the necessities of a people,
living as a parasite on the misfortune of the individual
or the necessities incidental to the formative stages of a
country's progress, has always been detested. A man who
hoards money for its own sake, and who still has money
in amount far beyond his needs, is not a useful citizen.
Money is only of use when in circulation, or when saved
as a reasonable provision for the necessities of the future,
the accidents of life, or its decline.

In my opinion, Mr. Editor, a man whose mind is so
narrow that it is measured exclusively by the size of a
dollar, is not competent to give, on vacations, an opinion
which is worth a fig.

J. H. DARBY.

Mr. Scrooge and Mr. Sage.

From the Bookman for July.

WE have nothing to say editorially about Russell Sage's widely
quoted and discussed paper on "The Injustice of Vacations."
Mr. Sage certainly has a right to his opinions and to express them.
In our mind the only question is, "Has or has not Mr. Sage been
guilty of literary plagiarism?"

From Charles Dickens's "A Christmas Carol."

At length the hour of shutting
up the counting house arrived.
With an ill-will Scrooge dis-
mounted from his stool, and
tacitly admitted the fact to the
expectant clerk in the Tank, who
instantly snuffed his candle out,
and put on his hat.

"You'll want all day to-mor-
row, I suppose?" said Scrooge.

"If quite convenient, sir."

"It's not convenient," said

Scrooge, "and it's not fair. If

I was to stop half a crown for

it, you'd think yourself ill-used,

I'll be bound."

The clerk smiled faintly.

"And yet," said Scrooge, "you

don't think me ill-used when I

pay a day's wages for no work."

The clerk observed that it was

only once a year.

"A poor excuse for picking a

man's pocket every 25th of De-

cember," said Scrooge, button-

ing his great coat to the chin.

From Russell Sage's article in
the Independent.

Let us assume that an em-
ployer and his clerk made an
agreement to exchange just re-
muneration for reasonable ser-
vices, and each one keeps his
part of the agreement. Are they
not then quits? If there is any
obligation, I think it is on the
part of the clerk, who avails of
the credit, skill and organization
of the employer to learn a busi-
ness and advance himself along
a path which has already been
prepared for him. What right
has he, then, to demand or ex-
pect pay for two weeks' time, for
which he renders no equivalent,
not considering the serious in-
convenience to which he often
puts his employer?

Suppose we were to reverse
the conventional order of things,
and, instead of the clerk de-
manding two weeks' pay gratis,
the employer should demand two
weeks' work without pay as a
condition of retaining the clerk
in his employ. What a tremen-
dous howl would go up.

L'Habitat.

SPRINGFIELD, Vt., June 29.—*Editor Forest and Stream:*
Born in the lofty Alps, in that part which bears the name
of Waldensian Valleys, I have been surprised, indeed, at
the beauty of the hills and valleys of Vermont. How I
would like to express my thoughts, especially after having
had the good fortune of spending many good times in that
very cabin which Colonel Brown has so well described,
and of which I would like to bring out what follows.

Colonel Brown gave a fine description of The Habitat,
but he is too modest to speak about the beautiful time
that guests have had there. If he has known how to ren-
der that shack so pretty, so interesting, so beneficial, he
has known, too, how to render it comfortable, not only
for gentlemen, but also for ladies.

There many a one, weary of the long city life, has found
not only rest, but a new spring of poetry and health, and
if we could read the hearts of those who have been there,
we could see not only how pleasant is the situation and
inviting is the cabin, but also how they have a sense of
thankfulness to those who have had so beautiful an
inspiration.

In the record book on the fire-place shelf one may see
how others have enjoyed their outing; and looking around
may realize how much more there is that one may enjoy.
There may be found silent, whispering, smiling, inspiring
Nature in all her beauty. There one may find, as I did,
the best recreation of mind and body; will feel the benefit
of the greatest and always true teacher—Nature.

Beautiful are thy hills, O, Vermont! and charming thy
small mountains; but within thy border other treasures
are hidden—those hearts that are building such retreats
not only for their own benefit, but also to help to make the
life of their fellow men happier.

In The Habitat I have spent many weeks that brought
to my mind my earlier life in my beautiful Alps. Many
times—although they are so different—I have compared
the St. Bernard refuge, built by the genius of Napoleon,
with this cabin. Here there is no dog to dig you out
from the avalanche and offer you the brandy he carries at
his collar; no monk to help you to go on the right side
of the other world; but if the St. Bernard refuge is there
to try to keep man from death, The Habitat is here to
give man health and life in this world. The St. Bernard
refuge is far from civilization, not only by illusion, but
by miles; the Vermont cabin is only three miles from the
hilly and pleasant Springfield, and in the nighttime one
may count many a light shining from the surrounding
farmhouses. The St. Bernard refuge extends its hands
of charity to the exhausted traveler, The Habitat a smil-
ing welcome to any human being that loves the beautiful
and good.

I remember many evenings, tired from a very hard
day's work, taking a walk to the shack for the night to
rest; and I recall one evening reaching there at eleven
o'clock and writing some of my thoughts:

*Oh, douce et simple cabane, tu es le séjour du bonheur
et de l'insouciance, le meilleur rétablissement pour les esprits
fatigués et faibles.*

R. H. ROSTAN.

Natural History.

A Study of Wrens.

EARLY one spring a few years ago two wren boxes
were set up in my rear yard, one on a pole near a large
apple tree, the other in a half decayed peach tree about
three feet from my study window. This was in a town
of northeastern Kansas. Though the house was right
in the midst of the residence portion of the city, it was
surrounded by a spacious yard, with plenty of tall trees,
and a small orchard in the rear. The boxes were pre-
pared early in the spring, so as to be ready for occupancy
when the house wrens should arrive from the South,
whither they had gone to spend the winter.

The doorways of the little apartments were purposely
made small enough to bar out the impudent English
sparrows, and therefore they and the wrens did not at
any time come into serious conflict. The sparrows flew
to the boxes, peered into the narrow doorways, perhaps
tried to gain admission, but in vain, then made off with a
series of resentful chirps, which were meant to express
their candid opinion of anyone who would treat them in
so paganish a way.

The latter part of April brought a pair of house wrens
to the premises—no doubt the same couple that had built
their nest the previous spring in one of the outbuildings.
Only a short time elapsed before they were diligently in-
specting the boxes; first scuttling over the exterior, ex-
amining every part with elaborate care to make sure
there was no trap about them; then slipping into the in-
terior and giving it a like thorough scrutiny. What in-
fluenced their choice I do not know, but presently they
selected the box in the peach tree, and went to work with
might and main to prepare themselves a domicile.

The female was an industrious worker. While her
spouse assisted her at intervals, most of his time had to
be given to song, perhaps for the purpose of cheering
his mate in her arduous toil. Whatever others may think
of it, I like the house wren's little sonatas, which roll
and gurgle in a rich tremolo from his palpitating throat,
causing him to quiver from beak tip to tail tip to produce
them. And then he is so lavish of his minstrelsy, keep-
ing it up from dawn to dusk! The female also sings, and
I must admit that I am unable to distinguish between her
roundels and those of her lord, though, as she is busy
with her housewifely duties, she has not so much time for
singing as he, but simply punctuates her work here and
there with a dash of music. Having placed a twig in its
proper place in the box, she may pause a moment on the
little porch and gurgle a happy tune before she darts
down for another timber.

This leads me to describe the architectural methods of
the little damc of the peach tree box. Madam wren al-
ways wants the cavity in which she erects her cottage
to be well filled up; she does not fancy a great big empty
room for enemies or ghosts to lurk in—at least, that is
the natural interpretation of her conduct.

Therefore, following the vogue of the species, the little
wren proceeded to carry twigs into the box. She found
the twigs on the ground, to which they had fallen from
the trees. The box was all of fourteen feet from the
ground, yet she would often fly almost straight up to the
little porch with a good-sized twig in her beak. How-
ever, her usual method was to fly up to a twig of the
tree, then to another, then to the box. Some of her ex-
ploits on the wing were interesting and a little surprising,
for she would often dart up toward the bottom of the
box, glide around the side, and alight on the top, thus
describing almost or quite a semi-circle; always, too,
with a twig in her bill.

She had a great time getting some of her timbers
through the tiny doorway. Of course they had to be
put in endwise, but some of them were long and crooked,
and in order to fly up with them she had to take them
as near the middle as possible, so that the ends would
balance; then when she would try to go in through the
narrow entrance, the twigs would catch at the sides.
There was always danger, too, of a long and heavy twig
—heavy for her—slipping from her hold on the little
veranda and falling to the ground. In spite of her ut-
most vigilance and skill, a twig would sometimes escape
her, and she would dart down after it like an animated
bullet.

It happened more than once that she was not able to
carry an obstinate twig with her into the box, especially
after the interior had been somewhat filled up; in which
case she would force one end in a short distance, then go
in herself and tug at the stick until it was pulled to its
desired place in the mound. If ever a bird made a slave

of herself in building a domicile, this little wren did, though, of course, it was what we would call "voluntary slavery." You may be sure her position in the industrial world was no sinecure. But she was cheery in it all, and would often stop a moment on her little portico and gurgle her sweet and rolling ditty.

There was work to be done on the inside of the box, too. Every twig had to be placed just right, just to suit the finical taste of the little housekeeper; for if you will lift the lid of a wren's box after the little ones have flown, you will find that the twigs are plaited and woven together in a wonderful way, to make a platform on which to build the nest of grass and down on the top.

It is too bad to have to report that all the little dame's sedulous toil had to go for naught—but such was the case, and for this reason: After she had carried in twigs for several days and was almost ready to begin the building of the nest proper, another female wren arrived on the scene, and, scorning the empty box by the apple tree, laid covetous eyes on the box already occupied by wren No. 1. Though all house wrens are almost the same size, the newcomer looked to be slightly larger than her predecessor. Then there was war in Wrenville for a while. The first wren made a gallant fight for her rights, but in spite of all she could do, the intruder would get into the box and play havoc with her timbers, scattering them with a vengeance that was amusing to see.

At such indignities wren No. 1 would fairly quiver with rage, darting about among the twigs of the tree or scuttling over the outside of the box, not daring to enter the doorway while her enemy was within. Strange to say, all her scolding was done by singing, a petulant quality being infused into the tones. Sometimes she would venture to the portico and peep into the door, but was invariably driven away by her masterful foe.

The contest was kept up for several days; then the first wren decided to give up the useless struggle, as her enemy was stronger than she, and content herself with second or Hobson's choice—that is, the box by the apple tree, which she proceeded to fill up with twigs.

And what about the interloper, wren No. 2? Well, the work done by her predecessor was not at all to her mind; she proceeded forthwith to throw out every twig, carrying it to the door and tossing it contemptuously to the ground. The box emptied of all its offensive material, she went to work at once to fill it up with twigs according to her own ideas, no doubt using many of the timbers that she had previously ejected with so much show of scorn.

Then an armistice was declared in wren-dom. So far as I could see, the wrens did not interfere with each other's household affairs, though there was no evidence of a neighborly feeling. Each succeeded in bringing out a brood of brown and barred copies of herself. But what about the mates of the two rival housekeepers? They were never seen in the neighborhood after the quarrel began—at least, not by myself. It was odd, too. Had they killed each other in the first battle? or had they both been caught by a predatory foe? or were they simply cowards and made off when they saw that fighting was the order of the day? Echo does not deign a reply.

A few general facts relative to the natural history of the house wren may prove of some interest at this point. Mr. Frank M. Chapman says that the name house wren has been thought to be a misnomer for our little friend, because these birds are found in the deep forests of the South, many miles from human habitations, during the winter. But the same is true of many other migratory birds which seek human society in their summer homes in the North, while the winter season in the South sees them in out-of-the-way haunts, where they are the impersonation of wildness itself.

Besides, Mr. Chapman has this to say of our wren: "He is just as much of a house wren in the South as in the North; you will find a pair in possession of every suitable dwelling. The difficulty is that in the winter there are more house wrens than there are houses; and, being of a somewhat irritable disposition, the house wren will not share his quarters with others of his kind. Late comers, therefore, who cannot get a snug nook about a house or outbuilding, are forced to resort to the woods.

"In summer, when they are spread over a much greater area, house wrens are very particular in their choice of haunts, and for this reason are locally distributed. Having selected a nesting site, they become much attached to it, and return to the same place year after year. It may be a bird-box, a crevice in a building, a hollow in an apple tree, or a hole in a fence rail; wherever it is, it is theirs, and they will fight for it against all comers."

The writer has gathered a few facts relative to the range of the house wren. In northeastern Kansas these wrens were so common that almost every country home had its pair, and many a place in the towns and cities was similarly favored, especially in the suburbs. In a rambling tour in Arkansas and Indian Territory I found none of these birds in the latter part of April and the first week of May, and the same was true at Neosho, Kansas; but when I went north to Hume, Mo., a village some forty or fifty miles south of Kansas City, I found the house wrens plentiful, taking the place of Bewick's wrens, which were seen in many places in the more southerly regions visited. The last-named birds were never seen by me in northeastern Kansas during a residence of five years and a half in that part of the State.

Note again: In the neighborhood of Springfield, O., where I lived for a number of years, I saw the house wren only a few times, and then in an old orchard, and never close to a human dwelling; but a pair of the sweet-voiced Bewick's wrens were to be seen near almost every country and suburban home. At my present home in northeastern Ohio—Canal Dover—neither the house wren nor his long-tailed congener is to be found, but the Carolina wren is the house wren here. His song can be heard from the middle of April to the first of August, and even later, in the residence portion of the town, where he and his mate rear their young.

Nor is that all. On the 12th of April, 1903, Bewick's wren was singing in a village of northern Indiana, not more than six or eight miles from the Michigan line, and on June 25 and 26 the house wrens were singing in Elkhart, Ind., which was about fourteen miles from the village just referred to. Both of these Indiana towns are considerably further north than my present home in Ohio, and it strikes me as strange that the summer range

of the house wren and Bewick's should be so much more northerly in the Hoosier State than in the Buckeye State. While I am not envious of my neighbors, it would be pleasant to have these agreeable birds for summer companions at my present home. Is it not odd, too, that Bewick's wren is not found in northeastern Kansas in the summer season, while in Indiana it goes as far north as the extreme northern part of the State? The northern boundary line of its summer range must be an exceedingly wavering one.

Returning to the house wren, it has been said that its name is a misnomer. So it is, to some extent; for, while this little bird is very partial to houses, I have more than once found it breeding in the woods in Kansas, and sometimes quite a distance from human dwellings. One of these woodland tenants had selected a hole in the under side of a dead limb for its nest. Like its urban relatives, it filled up the interior of the hollow with dead twigs, which were far from easy to handle in the circumstances, for whenever the little builder would fly to the branch below its doorway with a twig, it was compelled to wheel half way around as it flew up, catch itself with its claws at the under side of the log, and manipulate the twig until it could push it in endwise. Many a timber was recalcitrant, but the little architect went on the good old-fashioned principle, "If at first you don't succeed, try, try again." The western house wren, which I studied in Colorado, has the same inclination to live a secluded sylvan life when the mood seizes it.

It is fun to find the most acute and scientific bird students tripping now and then. No doubt some of our own mistakes are just as amusing to them. One of the best and most up-to-date scientific manuals published in this country declares that the Carolina wren does not care for the home of man; that "his wild nature demands the freedom of the forests." My observations lead me to differ from this statement, for in Missouri, Kansas, and eastern Ohio, I have more than once found him nesting in cosy nooks and corners about country homes, and even in somewhat thickly tenanted portions of town. While this is true of some individuals, others seek habitats in the wildest haunts they can find, proving that tastes differ in the wren world as well as in the human world.

LEANDER S. KEYSER.

Destruction of Birds by Storms.

REFERENCE has frequently been made to the cold storms of the winter of 1898 and 1899, which, extending as far south as South Carolina and Georgia, reached the winter home of many migrating birds and destroyed them in vast numbers. Such is one of many causes which may destroy bird life. It is the testimony of all field ornithologists that comparatively few migrating warblers were seen in New England in the spring of 1903 or of 1904. What the cause of the scarcity may be, no one seems to know.

The Fifty-first Annual Report of the Massachusetts State Board of Agriculture contains an extremely interesting paper on the destruction of birds by the elements in 1903 and 1904, by Mr. Edward Howe Forbush, ornithologist to the State Board of Agriculture. Mr. Forbush has gathered by correspondence and otherwise an amount of information concerning the weather conditions affecting bird life which is well worth consideration.

After the middle of April, 1903, but little rain of any importance fell until the 7th of June. "In the woods, meantime, the ground and its covering had become so dry that brush and forest fires which had broken out in many parts of New England spread rapidly, and in many cases escaped beyond control. They devastated large areas of wood and timber land, destroying also many isolated farmhouses and hamlets. * * * The amount of smoke and fine ashes suspended in the atmosphere caused so-called yellow days from June 3 to 7. The smoke was at times so dense in all the New England States as to obscure the stars at night, and during the day the sun appeared like a red ball in a yellow sky. The wind movement was light, and smoke hung like a pall over the country, while the odor of burning wood filled the air. Vast numbers of birds' nests and eggs and young must have been destroyed in these fires."

Beginning with June 8, however, the weather became cloudy and rainy, and so continued until the end of the month. During a part of this time the temperature was very low—under 50 degrees—and on only four days did it rise above 70 degrees. With this cold and rain there were high winds; branches were broken from trees, and birds' nests with eggs or young destroyed.

Following the heavy rains came floods; the Concord meadows were overflowed, as were some of the meadows of the Connecticut. The overflowing of the land, with the continuous rain and cold, removed the supply of insect food on which so many birds depend. All birds breeding on or near the ground in low land had their nests swept away, the young birds drowned, and their eggs destroyed. Red-winged blackbirds, bitterns, rails, and swamp sparrows, were among the chief sufferers. Undoubtedly large numbers of adult birds died from lack of food, the cold, and the pelting of the rain.

Circulars of inquiry into the damage were sent out to many correspondents, and the replies received were very interesting. One of the observers, Mr. Bailey, stated that the storms June 12 destroyed nearly all the nests of vireos, Baltimore orioles, and chipping sparrows within a mile of his home; while Mr. C. A. Reed declared that out of 21 nests that he had under observation, only one escaped destruction.

The loss of swallows, martins, and swifts in portions of Massachusetts was very great. In some localities the chimney swift appears to have been exterminated; while in others, the martins were almost all destroyed. From one great chimney, or stack, occupied by the swifts as a roosting place, three wheelbarrow loads of dead birds were removed after the storm of June 21. Mr. J. A. Farley reports the extermination of a colony of martins that he had established, and other similar cases are mentioned, the birds in many cases being much emaciated, and appearing to have starved to death. Many additional instances are cited with relation to all our common birds.

Following this unprecedented summer, came the bitter winter. Of the birds which winter in the north, those which seemed to have the easiest time were perhaps the

woodpeckers. Many people fed the birds, and so helped them through, but that there was a very unusual mortality due to the intense cold and the heavy snowfall, cannot be doubted. Mr. Forbush suggests the rearing of bird-like bluebirds and martins for the purpose of re-establishing colonies that have been extinguished. He calls attention also to the desirability of providing winter food and shelter for the birds, and points out how this may be done. Efforts in this direction are well worth making.

Do Foxes Climb Trees?

MICHIGAN CITY, Indiana.—*Editor Forest and Stream:* This conundrum is especially intended for your Southern readers, because I have the assurance of a Southern guide that they do "down in Alabama."

I have seen dogs go up the trunk of a leaning tree, a Wm. Wells, of Green River, Wyoming, has some photographs showing dog and mountain lion face to face in the branches of a tree. In this case the tree had branches close to the ground, and the dog had scrambled up among them after his game until he found himself twenty feet or more from the ground.

I suggested to the above mentioned guide that probably the foxes he spoke of climbed trees in much the same manner, but he repudiated the necessity of any such aid, and said the foxes on that flat coast sometimes climb straight, limbless trunks. He had seen one in a sapling not more than four inches in diameter, and this feet from the ground, and had killed it. Asking how the fox climbed, not being built for the purpose, he said it lugged the trunk between the fore legs, and digging its claws of the hind feet into the bark, scrambled up.

R. M. and I were with this guide for several days in the month of March just past, camping on a nameless creek a few miles from the Gulf between Mobile and Pensacola, and he seemed to be a man who wished to tell only facts. He had been "North" once, as far as Lexington, Kentucky. Our amusement was fishing for bass, and to my surprise we caught both large and small-mouth. The guide had assured me that they had small-mouth bass there, but as I had always read that only large-mouth were found in Southern waters, I had not believed him, supposing he referred to some other fish. Besides, we caught "speckled trout," which are not trout at all, but weakfish of Northern waters, I am told, and "snappers" distinguished by a couple of tusks in the upper jaw, and large sunfish or "brim."

The guide killed a snake which he called a red-bellied moccasin, and said it was very poisonous. Can any of your readers tell me its true name? Could it have been a copperhead? It had a very blunt tail, a copper-colored belly, and markings on the back something like a rattlesnake.

There is one more question I have been intending to ask FOREST AND STREAM for two or three years—What was the route exactly of the overland stage coaches from the Platte to Salt Lake in the days immediately preceding the completion of the Union Pacific Railway? March, 1868, I went from Omaha to Cheyenne by rail, and there took a stagecoach for California, where I then lived. It was a pretty rough trip, and I have a vivid recollection of part of it, but I kept no notes, the names of places. Fort Bridger was on our route, and I remember that very well, but I believe there was no other settlement, except the company's stage station from Cheyenne to Salt Lake. I remember Rock Springs station, for the Indians drove off some stock there one hour after we left, as we learned by telegraph at the next station.

Can any one of your readers refer me to a book which gives a map of the old northern overland stage route, can anyone outline by the present counties of Wyoming about the route we took?

LEXDEN.

[Gray foxes (*Urocyon cinereo-argentatus*) commonly climb trees. Frequent instances of this habit have been published in FOREST AND STREAM.]

The old Oregon trail started from Independence, Mo., crossed the Kaw, went northwest until it struck the Platte, not far from Grand Island, followed up the Platte, up the North Fork, up the Sweetwater through South Pass, and then southwest to Fort Bridger. The later California trail went southwest from Fort Bridger to Salt Lake City, Ogden, westerly to Humboldt River to Humboldt Lake, and west across the Sierras, striking the Sacramento River about where the American River enters it. The modern (1868) stage road from Cheyenne west, probably followed substantially the surveyed line of the Union Pacific Railroad, through Fort Sand (Laramie City), Rawlins, Green River, and Fort Bridger.]

Rare North Carolina Birds.

DURING a recent ornithological trip in North Carolina Mr. T. Gilbert Pearson, well known as the secretary of the Audubon Society of North Carolina, made some interesting observations on water birds. Among other things, he found the American egret and the snowy heron breeding in limited numbers in the eastern portion of the State, and had the good fortune to find three water thrushes (*Anhinga anhinga*), this being the second record of their occurrence in North Carolina. Mr. Pearson made the first record for this species in that State six years ago this summer, when he was fortunate enough to secure a male bird, which flew from its nest of four eggs in a cypress tree on the margin of a lake.

A Dog's Grief.

BOSTON, Mass.—*Editor Forest and Stream:* As a contribution to the list of recorded instances of grief in other emotions—in animals, let me give a single case:

When I was fourteen years old, our family removed from my birthplace in New Hampshire to Illinois. I had no brother, but I had had for years one faithful and passionately loved companion—my dog. We had grown together and had been well-nigh inseparable. The illness of several members of the family and the fact that the dog, which was quite large, had not been trained to familiarity of railway cars, or even to ride in a carriage made it impossible for him to be taken with us.

will not attempt any description of the almost heart-breaking sorrow of that parting. It was the greatest grief of my life up to that time, and remains in my memory as something most pathetic and pitiful.

It is beyond question that after we had gone, grief for my family very nearly killed my loving and faithful dog.

Day after day he would go out to the top of the hill to my old home and lie all day looking down the road which we had disappeared—waiting and watching for me—and only at nightfall coming back to the house, and creep with a groan under a sofa, whence no one could see him. He refused food, and lost flesh to such an extent that the friendly people who occupied the house and who had his suffering thought he would surely die. After months he left the old home to live with a boy in the neighborhood who had been my playmate, and who, doubtless, most suggested to my poor Watch his young master. My devoted dog "was not capable of mental pain," as I was not, and no one is.

C. H. AMES.

Squirrels and Mulberries.

WHILE on my way with a party to the Fair, as we were strolling along one of the avenues in Forest Park, I noticed ahead of us in a large mulberry tree a great commotion. The branches were alive with moving objects. I saw it was too early for robins, wax-wings, and other fruit-loving birds to have begun to flock, and what those moving objects were that made things so lively among the branches was a mystery to me, until I got near the tree, and then the whole matter was explained. Squirrels! Under the tree were many of the little fluffy tails gorging themselves upon the ripe fruit dislodged by the squirrels the limbs, and as the sweet morsels fell to the earth they were quickly rescued from between the grass roots. I thought the squirrels upon the ground were larger and older than those up the tree, repeated trips at various times to this tree educating them to the fact that one could fare quite as well without doing any climbing and scaling.

It was an interesting sight, and we had the machine stopped still to enable us to enjoy it. I don't know when I have seen birds thicker in a cherry tree than were those squirrels. And I tried to imagine what a clearing of the branches there would have been had a strenuous cat essayed to climb that tree! There would have been some tall

scrambling, and we no doubt would have been obliged to testify that gray squirrels can fly—when they have to.

CHARLES CRISTADORO.

The Yellowstone Geysers.

A RESURVEY of thermal activity after a five-years' absence, convinces the writer that no appreciable diminution has taken place, either in the volume of hot water discharged or the force and energy displayed. Naturally with all this surface evidence of underground disturbance, the question is not infrequently asked if earthquakes occur in the Park, and since the catastrophes of Martinique and St. Vincent, such inquiries are made even more often than before. Earthquake shocks have been reported, but they are probably due to slight detonations near the surface, caused by the condensation of steam upon coming in contact with cool waters in underground chambers or channels, the explosions being heard for a distance of a mile or two, accompanied by more or less of a tremor. Within recent times there is no evidence of an earthquake in the sense of any real movement of the earth's crust, other than that noted at Silver Gate, which bears proof of considerable antiquity. The reason for this absence of earthquakes is to be found in the presence of so many natural safety valves, furnishing sufficient vents for pent-up steam.—Arnold Hague in Scribner's.

Eagle, Robin, Pelican.

BREWER, Maine.—*Editor Forest and Stream:* A notice of a book on natural history which the publishers advertise is designed as a supplementary school reader for the fifth and sixth grades, contains the following:

"The eagle, Mr. Pearson tells us, can easily cover a distance of one hundred miles an hour. This statement of an eagle's speed of wing is a specimen of the many remarkable facts brought to light in this volume."

"In dry seasons, when robins cannot find ready-made mud to daub their nests with, they have been known to carry water in their beaks to a road, and there mix the mud for themselves."

"Into the pouch beneath the lower part of a brown pelican's bill the author once poured fifteen quarts of water, and it held them all."

If you think it worth while, will you ask the opinion of your subscribers regarding the accuracy of these state-

ments. As to robins carrying water to the road to mix mud, if they ever carried anything, they would carry the dirt to the water. But I have never seen any instance of their needing to do either.

MANLY HARDY.

Cat's Queer Nursing.

Editor Forest and Stream:

I have been much interested in the accounts of queer eating habits of certain cats. I have "had the pleasure of the acquaintance" of several cats with peculiar traits and habits. Our present house cat, and the pet of my children, is one of them. She has entire confidence in human beings; her confidence has never been abused, and she seems absolutely without fear of man. She was taken from her mother when a very small kitten, and fed and cared for by my children.

From the first she seemed to us to remember the act of nursing, and to want to draw nourishment in the way natural to a young kitten. She likes nothing better than to lie upon soft cloth and to gather a little bunch of it and suck it precisely as in the act of nursing—pressing the cloth with alternate movements of the fore feet, purring, and showing every evidence of earnest effort and expectation of reward. This she will do for long periods, and as sedulously now as when a little kitten. Every one remarks the seemingly pathetic character of the performance. Can any explanation of it be suggested?

C. H. AMES.

Currituckers say Ducks Smell.

CURRITUCK, N. C.—*Editor Forest and Stream:* If you will accept at this late date some testimony to back up Mr. Cristadoro's duck smelling story, I have it to submit, on the authority of a score or so of old Currituck duck shooters.

It is a well-known fact at Currituck that mallards, black ducks, sprig-tails, green and blue-wing teal, gadwalls, spoonbills, and all kinds of ducks that do not dive for their food, can smell, and seem perfectly to distinguish the scent of a human being from other animals. The fact is that it is next to impossible to get any of these birds to come to decoys if the decoys are placed directly to leeward of one's blind or point. No good hunter in our sound ever thinks of doing so, if it is possible to avoid it. On the other hand, canvasbacks, redheads, blackheads, and other kinds of divers do not seem to possess this power.

MORE ANON.

Protection for Wildfowl.

PHILADELPHIA, Pa., June 20.—*Editor Forest and Stream:* FOREST AND STREAM has already done so much for game preserving by insisting upon the principle "No game of game;" the United States Government has done much in the way of preserving the large game animals in the Yellowstone Park, and establishing game refuges in different parts of the West; and we have seen such success attend the efforts in New England to preserve quail, that I am anxious that something should be done for my game—the quail, wildfowl, plover, snipe, and other birds. I am particularly interested in the preservation of quail, but we will let that question pass for the present, because I think they will have to be taken care of by the different State governments.

It seems to have been found comparatively easy for the United States Government to undertake the preservation of the large animals—deer, buffalo, and elk—probably because they attract attention from the general public, are opposed to be wonderful and valuable, and are often the subjects of books and newspaper articles of romantic hunting adventures which amuse the ordinary reader. It is to my mind—and I think to most mature and experienced sportsmen—the game birds—quail, ducks, plover, snipe—are in many ways more important, afford more genuine sport to a larger number of people, and, if reared in numbers, would contribute more to the general health and happiness as well as to the wealth of every community. Even if the large animals were increased to the greatest number possible there would still be comparatively few who could afford to hunt them, and the number allowed to be killed would be considerably restricted. Game birds, moreover, can be preserved and multiplied in settled or other regions unsuited to the large animals.

I am not, of course, opposed to preserving the large animals. I am heartily in favor of it. Let us develop the animal and bird life of nature in every form. All I am attempting in writing this letter is to see if the interest and effort which has been so successful with the animals can be extended to the birds.

Little or nothing has been done to preserve the wildfowl, and I shall speak of these alone, because the methods that will preserve them apply equally well to the other birds. I am somewhat familiar with the duck-shooting resorts along the coast from New Jersey to North Carolina, and am free to say that any attempts at preservation have heretofore been a farce, and some of

them are worse than useless. The laws are seldom, if ever, enforced, and the few that are enforced are enforced in a way to do more harm than good.

I am aware that in some localities—notably on the coast of North Carolina—there has been a certain kind of very successful preserving. A club, owning a large tract of marsh, will appoint private wardens for that marsh during the season and carry out what is certainly a perfect instance of game preservation. That is to say, the marshes are faithfully guarded; no one but members of the club will fire a shot there during the season, and a hundred or a hundred and fifty bushels of corn will be scattered in the marsh to feed the ducks. The ducks being thus undisturbed, will resort to the marsh in great numbers, and the members of the club will have excellent shooting. I know of several clubs of this sort where two or three members have killed over a hundred ducks in a day, and I know of one club where the number killed by only about a dozen members in one season amount to 5,009.

But I do not call this real game preservation. It is simply building an ingenious trap to bring the few remaining ducks into a small, quiet space, make them tame, and slaughter them wholesale. The whole stretch of the Atlantic seaboard, the lakes, rivers, and other duck resorts of the far West, are left unpreserved, and shooting goes on indiscriminately. There is very little use in isolated duck preserving, either by individuals or by a single State.

Of what use would it be if Virginia alone really executed good game laws and preserved the ducks within her borders, while the indiscriminate shooting went on in all other States throughout the Union? The citizens of Virginia would say that their State was simply making a fool of itself and gaining nothing by it; and as a matter of fact, that is what the people in different localities always feel, namely, that there is no use in their executing their own laws and preserving wildfowl, so long as indiscriminate shooting is carried on throughout the rest of the country.

I have lost all faith in any preservation of the wildfowl by action in any one State. If we could get them all to agree to execute laws at the same time, something might be accomplished; but to attain such an agreement among the fifteen or twenty States which practically control the duck region, will be quite difficult; and yet we must solve that difficulty or turn the whole subject over to the general Government. The conditions of State government are all against wildfowl preservation. The State politi-

cians and the State officials are afraid of the classes who are interested in duck slaughter and the sale of ducks. The laws are never executed, and it is often difficult to get even good laws on the statute books.

North Carolina has been able to pass rather stringent laws regulating duck shooting by non-resident sportsmen who come into the State. But she has not been able to get on her statute books any laws restricting the shooting by her own native market-gunners. If I go to North Carolina to shoot, I am restricted to certain days in the week, and I can shoot only from blinds where my chances are extremely limited. But the native market-gunner can shoot from a battery with 250 or 300 decoys, with the best chances in his favor, and ship all of his game out of the State.

North Carolina has fortunately succeeded in passing a law preventing the shipping of quail out of the State, but so strong was the market-gunning interest that they did not dare to put on their statute books a law prohibiting the shipping of wildfowl out of the State; and everyone knows that if such a law were passed it could not be enforced.

It seems as if we would never be able to do anything to check the destruction which will soon exterminate all the wildfowl, unless we get the matter taken up by the United States Government, regulated by an act of Congress, which will be uniform throughout the whole country, and enforced by United States marshals and officials who are not afraid to execute laws, and have the full force of the general Government behind them.

I regret to say, however, that if there were now an act of Congress regulating the preservation of wildfowl throughout the United States, it would in all probability be held unconstitutional by the courts except in certain districts, like the Yellowstone Park, belonging to the National Government. Possibly eminent counsel might devise legislation of this sort that would not be unconstitutional, but at present I see no way of doing it. An amendment to the Constitution giving Congress jurisdiction for the preservation of wildfowl, or certain classes of game, will probably be necessary to accomplish our purpose. An amendment to the Constitution is difficult to obtain, but by no means impossible. We have obtained fifteen of them in the course of our history, and can obtain one more if we go about it in the right way.

We must make up our minds which is the better course—to obtain an amendment and Congressional legislation which would probably settle the question permanently, or obtain uniform laws and uniform execution of them in

twenty different States. In either case, we must have a large organization of sportsmen with a salaried secretary or other official, to work for us all the year round, and a good supply of money for expenses.

I suggest that all of the sportsmen in the country, together with other lovers of nature, members of Audubon Societies, and every individual that can be persuaded to come to our assistance, be organized into a great league or association, with small annual dues of from two to five dollars, according to the numbers we can obtain. We may be able to obtain such numbers that two dollars, or even one dollar, a year would be enough. We must then decide which course we shall pursue, the amendment or uniform State legislation. Having settled that question, we could hold annual meetings and distribute literature all over the country, and agitate the question in every newspaper in every county, and have members using their influence in every corner of the United States.

If we once got control of the situation, with uniform action throughout the great duck-shooting regions, we could, I think, very soon restore the wildfowl to the condition they were in sixty or seventy years ago. We could in the beginning declare every other year an off year, with no shooting at all, and I believe this would, in a very short time, produce an increase that would astonish everybody. We would soon not need any off years, but could shoot every year, under proper restrictions.

SYDNEY G. FISHER.

Don't Kill the Hedgehog.

ONE day in the autumn a fawn was with its mother enjoying a good feed of beechnuts, which were thick upon the ground. "Oh," said the fawn, as he ran his nose against a hedgehog quill that lay among the fallen leaves, "I do wish those fellows were not so careless in discarding their outer garments, and I for one am glad that my coat is not as coarse as theirs, stupid things that they are."

"Softly, softly, said the mother deer, "you should not speak so of one who is the best friend we have in all the forest. They help us to many a meal when starvation stares us in the face. If it were not for his rough coat, he would have but little protection against the pack of hounds that you remember live down by the edge of the clearing."

But the smarting of the fawn's nose put him in no mood to see much good in having a neighbor like the hedgehog.

It was not long before winter set in, the snow became deep, and day after day the poor deer had to travel over the same route from one end of the swamp to the other, until there was not another branch or bough that they could reach. They had become so weak they could not break new roads through the deep snow to find other feeding grounds. Then there came a day when the wind blew from the east, and that evening the rain came down in torrents; but before morning the thaw had turned to a cold which caused a hard crust to form over the deep snow. "Now," said the mother deer, "is our time to call on neighbor hedgehog, and see how he and his family have put in the winter."

Away up by the granite ledge they found that their neighbor had managed to keep a good path from his den out to the several hemlocks that stood in his front yard. They found him at work away up in the top of a tall hemlock, out on a limb as far as his weight would allow. Here he was, as busy as he could be, cutting off the tender boughs with his teeth and letting them drop to the ground; then he would descend and enjoy eating them; but he was always sure to cut off enough so that his neigh-

bors could have a feast as well as himself. Every day the deer made a visit to the hedgehog den for a feed, and he, being an industrious fellow, always had the table well supplied, and helped to keep the wolf from the door of his neighbor until spring.

That is why I don't kill hedgehogs.

BYRON E. COOL.

Adirondack Deer and Forests.

Editor Forest and Stream:

The note this week on Adirondack deer prompts me to send the inclosed letter from Frank Chase, an experienced and reliable guide, who has spent his whole life of sixty-five years in the woods. He wrote about April 1 from Newcomb, concerning the deer and the forests, and the relation of one to the other, in the Adirondacks.

J. B. PELLETT.

"My experience this winter in the woods has taught me that the deer where I have been trapping (and I have been a good many hundred miles on snowshoes) are all right. I have found only one dead one. That was a little stunted fawn. Some scamp had killed his mother when he was very young, and he had grown but little, if any. There was a crust then, and the snow being so deep, he could not get around to get food enough, so got weak and perished on one of the coldest days. But that is only one case, and it is very evident that if his mother had been left to nurse him for two or three months he would have had a constitution to carry him through the winter.

"Lumbering is a curse to the Adirondacks. It is opening up the forest so that the poor deer and other animals find little protection from the cold wintry winds and deep snows. It seems like desecration. There may be places where the forests are so devastated by lumbering that the deer congregate at the most sheltered place they can find to winter, and after eating everything within reach that is good for them to eat, are obliged to eat balsam and cedar, which they will not eat unless they are obliged to. This weakens them greatly, and perhaps there may be some places where deer have succumbed to the cold in that way. I don't believe there is any epidemic among them. If I could see some of those deer and the ground and surroundings where they were found dead, it would not take me long to trace out the cause.

"Deer dig down to the ground to get a little moss or grass or something of that sort, until the snow gets so deep or a crust prevents them. We don't usually have a crust that will bear up a deer until some times late in February. I have seen many deer wallowing with the snow clear up half way on their sides. Forty years ago they did not lumber as they do now. They only cut the spruce and other soft timber down to ten inches and over. The result was that in a few years you could hardly tell that it had been lumbered. The young trees that were left soon grew up large and thrifty; the old tops rotted down, so that the only indication left that it had been lumbered would be occasionally an old stump that a person might sometimes mistake for a deer. Now it is cut and slash everything as big as a man's arm. What isn't cut down is knocked down by the other trees falling. After it is opened up so, little cherries and underbrush spring up thicker than hair on a dog. This generation will not see it again in its original beauty, and I am not certain that the next will. Thus I see the beautiful forest that I love so well despoiled by the inroads of what some people call energy, progress, and civilization."

FRANK CHASE.

A Good Told Story.

SHERIFF COOK, of Tucson, Ariz., has in his possession a weapon which was probably used in the making of history in Arizona in the days of the '60s and '70s. It is a revolver of an old model Colt, and was found on the between Sentinel and Agua Caliente a few days ago. There were found, rudely engraved on the metal of the letters, "K. W." Six notches were filed on the side of the barrel. The conclusion was reached that the gun was a part of the armory of King Woolsey, whose stronghold at Agua Caliente was one of the best known places in territory. The old weapon was shown to Justice Burr who said that it recalled to him an incident in a tour of party of "tenderfeet" across the continent. There was a breakdown of a Southern Pacific train near Sentinel, there was no prospect of the train moving for several hours. The tourists exhausted all the means of amusement at their hands, and finally one proposed shooting a target. Half a dozen revolvers were collected, several empty soda, beer and other bottles, which were found lying around the station. The marksmen established a range at a distance from the train and popped away at the bottles for an hour or two. One of the tourists, but only one, succeeded in hitting a bottle now then, and he was recognized as the Dr. Carver of party.

An old man with flowing whiskers, attracted by the charge of firearms, rode up and sat on his horse observing the target practice. Whenever the "champion" took the old man would give a grunt expressive of contempt. Finally the champion turned to him and said, "Maybe you think you can shoot?" The old man, nothing, but, dismounting, he picked up a bottle, fastened a string about the bottom of it in such a manner that the bottle would hang inverted. The old man tied the string to the limb of a mesquite. He next took the cork of the bottle, and when the bottle had become stationary measured with his eyes a spot directly under the mouth of it. He placed a flat stone there, and put the cork of the bottle upside down, directly under the mouth of the bottle. Then the old man set the bottle swinging, and, walking away 30 yards, he estimated the position of the bottle made a calculation of the momentum. He drew a revolver and fired. The bottle fell, and one of the tourists and picked it up, corked.—Springfield Republican.

Trophies from Canada.

EAST HAMPTON, N. Y.—E. B. Muchmore has, displayed in his father's store, the mounted heads of a caribou a moose, which he shot last fall in Canada. They are prettiest heads that have been seen in the place, that of moose being an especially fine specimen. A tape stretched from the tips of the antlers marks 51 inches; it has twenty-nine points. The caribou head has thirty-five points.

Arrested for Boarding Wild Birds.

CHARGED with having live wild birds in her possession out of season, in violation of the State game laws, Mrs. Christiana Unger was arrested in New York city last week by State Game Warden John E. Overton. In conversation Mrs. Unger said she was having a hard struggle to keep from starvation, when a man from the West asked her to board the birds. Magistrate Whitman held her for trial.

The Chain Broken! On the Cars!

THE breaking of the chain is synonymous with the closing down of the lid of your desk. There's the rub. But once closed and on the cars with your face pointed toward camp and canoe, and all is well. Expectancy and anticipation fill your mind and crowd out business cares.

So turning things over to my son (and blessed is the man who has a son who can share the load), here I am flitting over the rails, bound north for Kobekiana Camp, with my rod-case stuffed with rods that have remained idle and unused for many moons on the attic shelf.

I am alone because old man Bassford has failed me at the last moment, and instead of alternately listening to his yarns and holding my sides, I am whiling away the time writing these few lines. I have just finished reading my beloved FOREST AND STREAM, and find that Mr. McCandless has taken the wind from my sails in describing the robber thrush levying toll from the industrious robin. I saw the sparrows holding up the robins in this same identical way, and had intended to "remark" on same in your columns.

Well, as the minutes pass by, I feel that I am nearing the end of the trail, and there is where the fisherman expects to "find things."

In the seat beside me is my weatherbeaten rod-case, plastered up with Maine stickers that awaken in my mind memories of days that are gone—days of thirty years ago, when I tramped the woods and enjoyed my first trout fishing. It shows wear and tear, and I am sorry to

say the shelf marks are too much in evidence upon its weatherbeaten surface.

I am carried back to my first heavy trout. I am out on old Moxie Pond, above the forks of the Kennebec. The boys have gone up stream, and I have taken the boat and gone out to try by myself. I make a cast—the fly disappears without a ripple—a tug, and snap! goes my split bamboo at the second joint below the tip; a clean break, and the line and tip fall upon the water. With a sigh I recover the line, pulling it in by hand, only to find that the fly was "sot," and the fish was still fast. I pull in hand over hand, as one would do when fishing with a hand-line for bluefish, and fortune favors me, for I land a fine 3-pound trout at my feet in the boat. I look at the break, and find the wood damp and spongy, and then I remember that my rod stood next a tree during the night, and that it rained great guns, nearly washing us out of our lean-to, and I reason to myself that bamboo rods were not made to stand all night in the rain and do good work the next day.

I pull up anchor and row back to camp, and with jack-knife and waxed silk I make repairs, using a supporting sliver of wood on each side of the break. It is not a neat looking job, but I figure it will hold, and I go out again for the mate of my first trout, and cast and strike, and although the rod, as it bends under the strain, is not akin to Hogarth's line of beauty, yet it holds. The fish is gamy to the last, and as the fight goes on I begin to lose confidence in my splice, and wonder if it will last. It does, and as I slip the net under the trout I draw a

long breath of relief. And I land another, and as I the camp-fire glimmer on the shore I quit and pull the shore and supper. That experience taught me to keep my rods out of the wet at night, and to take more than one rod on an extended trip.

Then again I am up on Greenwood Lake after bass. It is late in the season and cold. The guide snaps his fingers after drawing them from the minnow bucket, baiting the hook. We are fishing up and down the lake rock in front of the club house landing. The bass is hungry, and after my third or fourth fish, my reel becomes useless. The best I can do is to borrow a brass sinker—one of the kind that goes with rod, line, hooks, and sinker in a department store—all for 75 cents. But I port in a storm, and I fish on under difficulties, and I bass after bass. And I learn the lesson to not only take an extra rod, but reel as well.

I am going where there are bass—large-mouth, white-eyed pike, and maskinongé. I have not as yet reconciled my way of thinking of the large-mouth bass as well Dr. Henshall regards him. I have taken him only in warm lakes, and found him so slow and unresisting that I was cured of any desire to fish for him. But in the north country, where the water is cold and clear, I told he conducts himself differently, putting up a fine class fight. We shall see. I am told of a lake near camp alive with bass; not of a large size, however, greedy for a fly, and full of ginger. I am assured that three or four flies mean a rise to each fly. That with four-ounce rod there's fun galore. And before I le-

home I hunt for a four-ounce rod that I know I have among all the rest—and it is gone! Loaned and never returned.

Why will people borrow rods, and why will the owners of the rods loan them out? There are two things a man never should loan—his wife and his rod.

But what can a man do—sometimes? A neighbor calls and asks for a rod. He knows you have them, and he is not enough of a fisherman to understand how a man feels about loaning a rod. Well, you succumb. And the rod comes back. You look it over and find that the friendly services of a doorjamb has been brought into play to dis-joint the rod, and your ferrules are crushed. *Sacre bleu!* you say to yourself, and you send your rod to the repair-man. Then you resolve to become diplomatic, and invest in a fourth dozen split bamboo rods—"Three-jointed, hand-made, highest quality, to-day 79 cents each"—and these be your loaning rods in future.

The train is speeding along the headwaters of the Mississippi. We are nearing the land where white pine is king. Booms and dams are in evidence in the infantile Father of the Waters, and train loads of logs are being emptied into the streams to float down to Minneapolis. The lumber jack with his canvas turkey is in evidence—as is his inseparable companion, a great flask of whiskey hidden in some capacious pocket netherly situated about his person. A crowded lumber jack filled car makes you think of the Kentucky audience when asked by the slight-of-hand performer if any man present had a pint bottle of whiskey about him. For a second there was no response, when a spectator asked: "Wouldn't a quart bottle do?" An affirmative answer resulted in the instantaneous production—held high in the air—of a quart bottle to every man. So with the lumber jack.

Poor devils! They work and toil and slave at the hardest kind of work all winter, chopping and sawing waist-deep in snow and with the mercury at thirty below, and yet sweating in their shirt sleeves sometimes; to bed

fish at so much per diem are not very satisfactory; the salmon in them are generally few and far between. And so I have dropped the more noble fish and am getting all the sport I can out of black bass, striped bass, and squeteague."

"Squeteague!" I exclaimed, "that is rather a come down for you."

"Well, I don't compare the two fish," he replied, "but really there's a lot of sport to be had with weakfish, as they are commonly called, if they are of good size and biting freely."

My old friend was right, for one may obtain quite exciting sport with those gamy fish, and they are so get-at-able in numerous localities they may be justly called the most popular of all the salt-water game fishes. Good fishing localities we have all along the New Jersey coast, around Long and Staten Islands, and in the Sound along the shore almost everywhere up to Narragansett Bay and on to Cape Cod are numerous good feeding grounds on which the fish may be taken. New York anglers follow it enthusiastically from its first appearance in May until it leaves for the south in November. Around Staten Island it is taken in considerable numbers, and in many localities, such as, for example, Tottenville, Prince's Bay, Annandale, Richmond Valley, Rossville, South and Midland Beaches, at which last named place good fishing may now be had from the long pier, a boat being unnecessary at that point.

Habits of the Squeteague.

Although it is a common game fish all along the Atlantic Coast from Cape Cod to the Chesapeake, and even further south, its favorite localities seem to be Vineyard Sound, Narragansett and Buzzard's Bays, where the largest and most gamy specimens are now taken. While the average weight in a day's catch around Staten Island will not greatly exceed a pound, it would be considerably larger in fish taken in Vineyard Sound, such

by many that this rig is the best, because it permits free play to the hooks. Feathered trolls * * * made strong with stout hooks and heavy, strong gimp, or wire snells, would be most killing among such coast fish as the Spanish mackerel, bluefish, and squeteague."

Phantom Minnows.

In my tackle kit are several phantom minnows which were imported a number of years ago from England; they are of precisely the same size and pattern as those which are used in trolling for salmon trout in some of the Irish lochs; they are made of thin aluminum, nickel or silver-plated, and differ from the ordinary phantom that is sold in this country in that they revolve more freely, and the hooks are so arranged above and below the minnow that they very rarely foul, and if a fish strikes, it never misses a hook. I tried them with the landlocked salmon in the deep water of Grand Lake, one of the Schoodic chain in Maine, and found them singularly successful. Subsequently I pitted them against squeteague in trolling in Vineyard Sound, and the avidity with which the fish seized them was astonishing. They revolved quite rapidly, even when the boat was moving at a slow rate of speed, and owing to their texture they were always as bright and silvery as a small herring. I do not know whether that make of minnow is now sold in our tackle stores, but if it is not, it would be good policy for the dealers to import some and keep them in stock, for they are greatly to be preferred to the soft, destructible ones that are commonly sold, which are continually fouling, and which will not revolve at a fair rate of speed unless the boat moves quite swiftly through the water.

Peculiarities of the Weakfish.

I have stated that, as a rule, the young flood tide up to three-quarters of the full is the best water for squeteague angling; of course those hand-line fishermen who anchor

THE SQUETEAGUE OR WEAKFISH.—From "Fishing Industries."

at dark, and up at the crow of the cock, and with his money coming to him when the break up of winter comes, he goes out into the world. One glass—the first glass—of whiskey is his undoing, and when he sobers up he is lucky to have the clothes on his back. But he has had a "good time," and he can earn more money, and he starts in at odd jobs until the snow falls, and he can go into camp once more.

We are making Brainerd when we stop for lunch, and then continue up to Pine River, where we take a stage and ride for twenty miles through the pine forests.

Already the fresh air blowing down from the pines gives one the appetite of youthful days—which is a very good sign that we can't arrive at Brainerd any too quickly for us now.

The headache and the chunk of lead at the base of my cranium already begin to leave me, and I feel it in my bones that a week from now I will return to my desk bronzed up and with energy and capacity for work of a trained athlete. And with everything pleasing in front of me, I'll close this letter.

CHARLES CRISTADORO.

Fish Chat.

The Lively Squeteague.

"SALMON angling is royal sport," said an old friend to me a short time ago, "but I have been obliged to give it up, and for several reasons. In the first place, I'm too old; it's all right for the younger men, but when one reaches his seventieth birthday he can't do it; the spirit is willing, but the flesh is mighty weak. Fancy me racing down a river fast to a salmon who has taken it into his head to run from one pool to another, perhaps a half mile or more away. I don't think you could imagine me displaying such nimbleness and endurance as would be needed. I couldn't climb over the rocks and boulders half fast enough. I could fight a salmon in a good deep pool, all right, if I were in a canoe, or had a reasonably smooth shore to keep my footing on, but when it comes to the rough work I can't do it. Another reason why I have had to give up following old *Salmo salar* is because all the good rivers are leased, and at high prices, too; I used to have a one-third interest in a New Brunswick river—had it, in fact, for ten years—but when the lease finally ran out, we let it slide, for the reason that the netters around the mouth of the river got about all the fish. We did not, along the last part of it, kill enough to supply camp needs; lessees of rivers ought to be better protected than they are.

"Of course, one can always get on a salmon river somehow by paying for the privilege, and there are still a few streams that are open to the general angler, but my experience has been that those rivers on which you can

small ones as those which are common further south being rarely seen.

Methods of Angling.

Now, I suppose that every squeteague angler believes that his own method is the best, but that some must be better than others is shown by the fact that while the anglers in one boat may obtain from forty to sixty in a day's catch, those in another boat not thirty or even twenty rods distant consider themselves lucky if they get a dozen fish. Squeteague, like other game fish, have their caprices, and "there are days when they will and others when they won't" accept the bait, and in order to be really successful with them, the angler must study their peculiarities, not only in different seasons of the year, but also in different conditions of the weather and tides. We may set it down as a rule that for weakfish the young and half flood tides are the best in most localities, and the last half of the ebb tides are the poorest, but even that rule is governed by circumstances. There are localities, such as, for example, near the Orchard Shoal Light, about four miles off Staten Island, where the water, which is from fifteen to twenty feet in depth, rushes along in both flood and ebb tides almost with the speed of a salmon stream, which seems to be a favorite locality for good-sized squeteague, and they are there almost always ready to bite well in all conditions of the tide.

Baits.

One may anchor his boat there at the edge of a reef, and he will find that almost any bait goes; shrimp, flood worms, sand worms, a piece of quahog or clam or menhaden, and from the first of July on a bait of sheddar crab will prove a most captivating lure. The angler will also find that a No. 4 fluted spinner—Skinner's preferred—will do good work, the strong current carrying the spoon rapidly away from the boat, and causing it to revolve quickly. In such a locality I have found that the phantom minnow proved a very attractive lure, and even good success was had with an old Buell's spoon. In fact, as the squeteague is chiefly a surface-feeding fish and is almost always ready to seize anything in motion, nearly any trolling bait will answer to bring it to the landing net.

How to Rig Spinners.

Ordinarily in using the spinning bait, I have rarely employed a sinker for squeteague, but no matter what it was, I have found that at least two swivels were necessary to prevent fouling the hooks and kinking the line, and in addition to the use of these have availed myself in my more recent fishing of the hint given by Genio C. Scott in his "Fishing in American Waters," in which he says, in describing a spoon bait: "It is so arranged that different fly-hooks may be looped on by their wires at the joint" [above which the spoon revolves]; "it is supposed

their boats and throw out their lines, which are baited with pieces of clams, crabs, etc., do not pay very much attention to the tide. They have out sometimes three or four lines, and their catch is made up of blackfish or tautog, scup or porgies, sea bass and squeteague; they are not weakfish anglers pure and simple, and the niceties of the fishing are entirely ignored by them. But the angler who is out for squeteague with rod, reel, and light tackle, is obliged to study the conditions of the tide or he gets no fish.

I have found this to be the case in many localities in Buzzard's Bay; if I could reach my favorite fishing grounds just before the turn of the tide, my success was almost always assured. The fish were then hungry, and bit ravenously at anything in motion, and if my supply of shrimp ran short when the fish were biting freely, I found that a strip cut from the belly of one of my squeteague and tied to the shank of the hook à la striped bass bait, was quite successful as a lure. Ordinarily, however, one has his best success in Buzzard's Bay and Vineyard Sound, at any rate, by "chumming" with shrimp, and a goodly supply of these little crustaceans is necessary. While I have always made it a point to chum sparingly, I have, in order to keep the squeteague about my boat, used up my stock of nearly two quarts of shrimp, and been obliged to throw out as successors to them small handfuls of salt-water minnows or "mummy chows," as they are commonly called in those waters.

Exciting Sport.

I shall never forget the glorious sport I had at squeteague fishing on July 4, 1901. Our yacht was anchored just off a headland, two or three miles from Wareham, a locality which was, I believe, a favorite one with ex-President Cleveland, who was, and I think is still, an ardent follower of this gamy fish. We arrived on our fishing grounds at exactly the right moment, the young tide having just begun to move in. As soon as our tackle was rigged and hooks baited with a couple of shrimp, our skipper began chumming, throwing the shrimp not too sparingly on both sides of the boat, but at a good casting distance from it in order that the little crustaceans might not swim back to its protecting shelter, which they are very often inclined to do, they seeming to know instinctively that if they can get near the boat they will not be molested by their destroyers, the weakfish.

I always prefer to kill my fish on light tackle, the sport I obtain with it seems to me to be more genuine and exciting than that which is obtained with heavier. My rod on this occasion was a quite light split bamboo, an ordinary trout rod, in fact; but my reel contained 75 yards of new and rather heavy line, for your squeteague often makes quite long runs, and I wanted to be prepared for any emergency. My casting-line was a short salmon

leader, and I used a rather stout sroat hook, and with a single swan shot only for a sinker, as I intended to do my fishing near the surface. My two companions used heavier sinkers and floats, which they permitted to run astern of the boat with the tide, twenty or thirty yards. Whenever our skipper cast wide his chum, I dropped my bait among the shrimp as they fell into the water, and it was not long before I was fast to an elegant fish.

The squeteague is usually called a weakfish, but a four or five-pound "yellow fin" is far from being a weakling, and the fish that I had hooked was no exception to the rule, for his runs were gamy, his leaps above the surface of the water were of frequent occurrence, and the fight he gave me, although of not long duration, was as plucky as I could have desired. And what a beauty he was as he was lifted by the landing net into the boat! His gray-spotted sides, which were coated with a silvery sheen, were beautifully iridescent, and his abdomen, pectoral, ventral, and anal fins were of a golden yellow.

"Good!" exclaimed my friends, as the skipper held my prize aloft, "first fish for you," and it almost seemed as if I detected in their congratulations a slight tone of envy.

"You are fishing too deep," I replied, "you'll get nothing down there but scup and sculpin," and even as I spoke each of my friends pulled up one of the last named exceedingly unpopular fish. Fresh chum was then thrown broadcast, and it was not long before I was fast to another beautiful yellow-fin; and I had taken my fourth squeteague before my friends discarded their floats and heavy sinkers, and imitated me at surface fishing, when their luck turned, and both of them until the tide turned caught their fair share of fish.

The squeteague seemed to be "on their feed" that day, for they took our bait freely; they were all of good size, and very gamy, and we lost but few of the fish we hooked, which is not generally the case among anglers, for the weakfish has an exceedingly tender mouth, and unless it is handled carefully it is apt to eject the hook during one of its wild runs or leaps.

Squeteague no Match for Bluefish.

It is a matter of common observation that where bluefish are abundant, squeteague are scarce, and for the reason that they cannot withstand the murderous onslaughts of their savage neighbors. The squeteague is in itself a very rapacious fish; it never spares a smaller fish, and often eats to repletion, but before the attacks of bluefish it is as helpless as a mackerel or alewife, and when a school of them are overtaken by the marauders they are cut up without mercy.

Weakfish and striped bass of the same size will live in amity side by side, and one may capture both species with the same bait and from one boat; but nothing will fraternize with the bluefish, and he treats every other species with the same degree of ferocity, even devouring the humble scup, small flounders, and other bottom fish in the spring when more tempting food is not obtainable.

EDWARD A. SAMUELS.

Fish Scales as a Test of Age.

SCALES of ordinary fishes, when examined under a lense or microscope, are seen to present a number of fine concentric lines arranged round a central nucleus, the form assumed by these lines being in some cases subcircular, and in others more or less irregularly ellipsoidal. Such lines evidently indicate intervals of growth. More minute examination will reveal the existence of a small number of more pronounced lines, or rings, as they may be termed, which often include from thirty to forty of the finer lines. A German investigator, Dr. Hoffbauer, basing his observations on carp of which the ages were more or less exactly known, found that the number of these pronounced rings in the scales gave an exact index of the age of the fishes from which they were taken, these rings marking, in fact, the limits of the annual growth of the scales. Taking these data as a basis, Mr. J. S. Thomson, of the Marine Biological Station at Plymouth, has for some time been conducting observations and experiments, with a view to ascertain whether the same law does not hold good for marine fishes, the various representatives of the cod family (*Gadidae*) being selected for examination. The results of these observations are published in the April issue of the Journal of the Marine Biological Association, and are of great interest and importance, more especially from an economic point of view. The memoir is of a very elaborate nature, containing tables of measurements of thousands of scales of these fishes and the number of lines and rings they display, and being illustrated by figures of magnified specimens.

After referring to the probability that a law which is found to be constant in the case of fresh-water fishes would also probably obtain in marine groups, the author remarks that, even after allowing for variation, the statistics he has brought together afford strong cumulative proof that in the members of the cod tribe the growth of the scales is cyclical, or periodic, and that the pronounced rings formed in these structures are annual. It appears to be undoubted that the scales show a larger surface growth and a wider separation of the lines in summer than in winter, this being in all probability due to a difference in the general condition of the fish and its surroundings at the two seasons. An examination of three or four perfect scales taken from the median region of the flanks, near the lateral line, where their characteristic features are best displayed, will, it is submitted, in ninety-eight cases out of every hundred, be sufficient to afford a very close approximation of the age of the fish. In fishes of more than four or five years old the percentage of correct estimates would be somewhat less than that given above, but this is, fortunately, of but little importance, seeing that for economic purposes the chief requisite is to be able to ascertain the age of younger fish. Corroboration of the truth of Mr. Thomson's hypothesis is afforded by the fact that his results agree very closely with those obtained by workers who have calculated the age of fishes from totally different standpoints. Owing to the life conditions of fish kept in tanks and aquariums being so totally different from those existing in nature,

it is impossible to verify the hypothesis by observations on captive specimens, but it is suggested that much might be done by careful observations of the scales of marked fish before they are returned to the ocean.—London Field.

Fish and Fishing.

Good Fishing at the Grand Discharge.

THERE has been a great improvement during the last few days in the ouananiche fishing at the Grand Discharge of Lake St. John. When the first anglers of the season arrived there, two or three weeks ago, they found the water unusually high for the middle of June. Nevertheless there was reasonable sport even then, as was discovered by Mr. B. L. D'Aubigné, of London, England, who enjoyed his first experience with the ouananiche there, in company with Mr. Geo. E. Hart, of Waterbury, an old-time friend of the fresh-water salmon of Lake St. John. Mr. D'Aubigné has fished many of the salmon and sea trout waters of the United Kingdom, and, like Colonel Haggard, finds little, if any, differences between the ouananiche and the Scotch sea trout. Among other sportsmen who have just paid their first visit to Lake St. John waters, are Mr. H. A. DuVillard, of Providence, R. I.; Dr. A. Greenwood, of Boston; Mr. and Mrs. A. P. Ward, of San Antonio, Texas; Mr. A. C. Chase, of Syracuse, N. Y., and his son, Mr. W. B. Chase, of New York. The Messrs. Chase and Dr. Greenwood were among the earliest anglers of the season at the Grand Discharge. They found that the fish preferred rather large flies, and most of the members of the party enjoyed the exhilarating sport of playing a brace of ouananiche together on more than one occasion. Mr. Ward, who has done a great deal of angling for coarse sea and other fish is a strong advocate of the automatic reel, like the late Mr. Eugene McCarthy. Mr. D'Aubigné and Mr. DuVillard, on the other hand—both experienced anglers—quite scout the idea of its use, and point to the success of the great majority of ouananiche fishermen in killing their fish without any automatic aid, as proof that the skill which can thus land the leaping ouananiche may well dispense with the use of the automatic reel in the fight with other fish. The majority of the fish thus far killed this season in the Discharge run from about 1½ to 3½ pounds, but of course many larger ones have also been taken. Both the number of anglers at the Island House and the size of the catches have shown quite an increase during the last few days, the water having about resumed its ordinary summer level.

The reports from the salmon rivers are not quite so satisfactory, the run of the fish having been much later than was expected. Some of the streams, it is true, have not yet been heard from; others report that few fish except kelt have yet been seen in the rivers. There is no reason to imagine, however, that this means anything more than that the season will be later than usual. Senator Aldrich and Mr. Henry R. Reid passed through here the other day on their way to join Messrs. Ivers W. Adams and Dr. Heber Bishop on the Moisie, and Mr. Louis Cabot, of Boston, has gone down to the Grand River on the south shore.

When Anglers Foregather.

It is a far cry from Lake St. John to Santa Catalina, but the picturesque character of some of the fishing scenes about the latter locality were related a few evenings ago to a party of anglers sitting around the log fire in the big open grate of the Hotel Roberval in so vivid a manner by a gentleman who has had considerable experience there, that one could almost fancy himself upon the spot. From the time that Peter and his fellow fishermen drew in so heavy a draught of fishes that the net broke, down through the babblings of Walton and his traveling companions in the inn beneath the friendly shade of the thatched cottage, and up to our own time, the discussion of fish and fishing—vulgarily called the swapping of fish stories—has very naturally formed the subject of discussion wherever fishermen most do congregate. We were extremely fortunate at Lake St. John the other evening in having with us gentlemen who had fished in almost every quarter of the world, and what is more, who had eyes and knew how to use them, and the happy faculty of cleverly describing what they had seen. We were all very much interested in Mr. H. A. DuVillard's story of the fishing at Santa Catalina, for that capital understudy of the tuna, the albicore. Though the majority of the fish taken run from 25 to 30 pounds each in weight, he had seen five tons of the fish taken in half a day by a fleet of less than twenty boats. The hooks are baited, as a rule, with a large pickled sardine, and there are usually two lines from each boat. The fish are frequently as close together as the members of a school of mackerel, and with five boats out together, with two lines from each, Mr. DuVillard has seen each of the ten fishermen fast to a fish at the same time.

There is no great demand for the flesh of the albicore, ashore, but it is eagerly sought off Catalina by the sea lions which swarm about in schools of 150 or 200. When one of the albicore is thrown to the sea lions, they will often tear a piece out of its body before it reaches the water. The particular herd described by Mr. DuVillard was under the rule of one of its number, known to all the frequenters of the place at the time as "Big Ben." When Big Ben pressed his claims for a particular fish, none dare say him nay. Over the sea lions and their prey floated a flock of gulls, some of which in their strenuous struggles for food had their wings broken by the sea lions from whom they had endeavored to snatch a portion of their prey. The scene of such sanguinary combats is frequently reddened with blood. Yet in the thickest of the terrible struggle, divers, of the loon family, confident of their own alertness, may be seen cleaving the water and safely rising from it again with whatever fish food they may have succeeded in capturing.

A description of the albicore led to the very reasonable suggestion from another of the party that the fish must be almost, if not quite, identical with the striped bonito which he had captured with rod and line off the shores of Japan, and so, presently, we were carried around in imagination to the scene of mahseer fishing in India, and listened spellbound to an account of the first wild rushes of the largest of the carp family, to which the run of a salmon

can bear no comparison. It is quite a remarkable fact that though the mahseer, differing herein from most predatory fish, has no teeth at all in its soft, leathery mouth, yet the great muscular power of jaw with which it is furnished in lieu thereof enables it to exercise such a violent power of compression that its prey is stunned and squeezed lifeless at the moment of capture, and a spoon-bait, the size and thickness of an ordinary dessert spoon, is crumpled up by it like a piece of paper.

Spoon-bait and minnow fishing for salmon in Irish and Scotch rivers formed the topic of another story, and an English angler present refused to be convinced that the Canadian salmon, which is identically the same variety as that of British coastal streams, would not also take bait if it were properly offered him. It is considered to be a pretty well established fact in North America that *Salmo salar* will not take any kind of live bait in fresh water, yet none of the salmon fishermen present were in a position to assure the visitor that live bait had ever, to their knowledge, been carefully tried on Canadian salmon streams, and, as already recorded in these columns, Mr. W. F. McCormick is authority for the statement that he has caught the Atlantic salmon with worms in one of the rivers flowing into Hamilton Inlet.

Death of the Hon. G. W. Stephens.

Another old angler has crossed the River of Death near his fishing grounds. The Hon. George Washington Stephens was one of the foremost friends of fish and game protection in the Dominion of Canada. A wealthy real estate owner of Montreal, he had been a member of the Provincial Government, and breathed his last a few days ago, while driving out to his fishing camp at Lake au Clair, adjoining the preserves of Chas. S. Simpson, of New York, and of the St. Bernard Fish and Game Club. Mr. Stephens was well known to a number of American anglers who fish in Canada.

The Value of Salmon Fishing.

A friend of mine who is thoroughly well acquainted with the Restigouche River and its tributaries, and knows something about the prices paid for fishing rights, hazards the opinion that half a million of dollars would not suffice to buy up the salmon fishing of those famous waters. And yet well within the memory of men who still go a-fishing, the whole of these fishing rights were leased for \$150 a year. The increase in the value of salmon fishing waters in recent years has been something phenomenal. The shares of the Restigouche Salmon Club, which were originally \$1,000 each, are now worth at least \$10,000 apiece. The rod and line fishing of the Cascapedia was leased some ten or twelve years ago for \$100 a year. Now the annual rental is \$7,500. Hundreds of thousands of dollars have been paid out by the Restigouche Salmon Club for fishing rights, in addition to those which it leases from the Government. It was in 1880 that the Restigouche Salmon Club purchased the property at Metapedia upon which its club house is situated. It cost \$31,000, and has a frontage of about a mile upon the Restigouche and the same upon the Metapedia, which here flows into it. A few years later they paid \$10,000 for a frontage of two additional miles upon the river, and then \$12,000 for a property on the New Brunswick side of the river, adjoining the Fraser or Metapedia property, which property had been secured as recently as 1884, for \$4,000, by Dr. Baxter, late chief medical purveyor of the United States Army. At different times since 1885 the club has acquired frontages on the Metapedia for about a mile on each side of the river, paying therefor about \$3,500. They paid \$25,000 in 1891 for Lord Mountstephens' property at the junction of the Metapedia and Causapsacal rivers. Four years later they paid \$35,000 for the Indian House property, which had cost the Messrs. S. and J. Wilmot, in 1880, only \$1,500, or an increase in value of some 2,300 per cent. in fifteen years. That this was by no means an isolated case, is shown by the fact that in 1894 they paid \$25,000 for the Patapedia pools, which had been purchased from the resident proprietors in 1882 for \$2,000. It may further be mentioned that Mr. McAndrew purchased fishing rights on the Restigouche, 17 miles from Metapedia, in 1883 for \$5,000, which he sold in 1896 for \$35,000 to the late Mr. Robert Goelt. The Sweeney and Sage properties at the mouth of the Upsalquitch were originally purchased from resident proprietors for about \$5,000, between 1880 and 1885. The Sweeney lots were sold in 1895 to Mr. Payne, of Cleveland, for \$35,000, and the late Mr. Sage obtained \$7,000 for only a part of his property from Mr. Clyde, of New York. It is freely stated that the Kedgwick pools and the waters immediately below them, which were bought a few years ago for \$7,000, would not now be sold for \$70,000, even if the offer was made.

There may be some speculations which pay better than some of these in salmon fishing rights have done, but if there are, I know nothing about them.

E. T. D. CHAMBERS.

Burning of "Hollands."

BLUE MOUNTAIN LAKE, July 2.—Fire! Fire! F-i-r-e! This was the awful cry about 6 o'clock last night. A glance sufficed to locate the fire. A huge column of smoke was pouring forth and flames were already bursting from the roof of the long-time popular sportsmen's resort known as "Holland's." In a few minutes nearly every man in town was on the spot, and doing his best. Hotel guests and summer cottagers vied with residents and employees; but it was evident from the first that the hotel was doomed, and attention was given to saving as much furniture as possible. The flames made such rapid progress that the roof soon fell in, and speedily one floor followed another to the ground. Desperate efforts were made to save the adjacent hotel cottages, but they all went. No private property was burned. The hotel belonged to the Blue Mountain Lake Hotel Company, but as "Holland's" had won its popularity with generations of sportsmen and tourists, and hosts of these will learn of its destruction with unfeigned regret. That no one was injured is cause for thankfulness. But one suggestion forces itself to the front, namely, that every large summer hotel—no matter how far in the wilderness—should have an abundant supply of water available for fighting fire, a good equipment of ladders, buckets, and other fire apparatus, and well arranged fire escapes. Why should not these, as well as less important matters, be regulated by law?

JUVENAL.

Massachusetts Fish and Game.

Just Recognition of Merit.

Boston, July 2.—*Editor Forest and Stream:* In my last letter I mentioned the gift of the Emperor of Japan to the chairman of the Massachusetts Commission. I have now to add other evidences of the great appreciation of Capt. Collins' work among those cognizant of it in foreign countries. Dr. Erenbaum, the celebrated biologist at Heligoland, Germany, on his way home from St. Louis, took a run on from New York for the sole purpose of paying his respects to the Captain. Among other distinguished visitors from abroad are Hon. Harrison Mudd, ex-Mayor of Grimsby, England, and Mr. Wm. Grant, member of the municipal government and a prominent citizen of that place; also Mr. T. Robinson, wife and daughter, of the same town, who were on their way to British Columbia to visit their married daughter. While it is well known that the work Chairman Collins had performed years ago in connection with the United States Commission was such as to make him generally known among those connected officially with the fisheries departments of European nations, the very elaborate and valuable reports of the Massachusetts Commission prepared by him each year since he became chairman of our State board, have been of such a character as to excite widespread interest and admiration. One marked feature of his last report is the pronounced fairness with which it deals with the results of the efforts of the board in fish-culture.

There is always a temptation before public servants in setting forth the results of their labors for the public good to claim too much, but in this instance, while showing by statistics some gain on previous years, the Captain confesses to a degree of disappointment with what has been accomplished. I will quote briefly from the report. On page 12 he says: "The results" [in raising fingerlings] "at the Hadley station has again been most disappointing;" and "it seemed impracticable to do more than was done in 1902" at the Sutton station. On page 18 he speaks of the hatcheries at Winchester and Adams "as only what may be called developing stations, where fish eggs may be taken in the eyed stage, hatched out and reared to the stage for distribution as fry." He expresses the opinion that these stations are not capable of being put to any other use than as "distributing points" for fry. To sum up in a single sentence, there remains only the hatchery at Sutton for the rearing of fingerling trout.

To all who have made a study of the subject, it has been known for years that the facilities for doing extensive work at Winchester were wholly inadequate, and now the stations at Hadley and Adams are brought under the ban of condemnation by the commissioners themselves, so far as pertains to the raising of fingerlings. Who is to blame for the selection of these localities? It is charitable to say those responsible only erred in judgment. At all events, we will "let the dead past bury its dead," and turn our eyes toward the future.

The courage and frankness with which the Captain states the actual conditions is worthy of high commendation. "Meantime," he says, "the hope is cherished that additional and adequate means for rearing fingerlings, which at least may supply what is lacking at Hadley, Adams, and Winchester, will ultimately be available to the Commission; * * * the necessity of meeting the public demand is too apparent to admit of question. To those who desire to see our streams abound in the gamiest and most beautiful of all fish, let me say there is work for you to do. That there are many localities where the waters are adapted to the rearing of fingerlings is a matter of absolute knowledge to the writer, and he believes there are within the limits of the State hundreds of such places which he has never seen." I venture the opinion, from a careful inspection of county and township maps, that it is feasible to so stock our streams and so facilitate the passage of fish to their spawning beds, as to multiply their numbers in the next five years more than ten fold. A law has been enacted the past winter giving the Commission authority to compel the building of fishways where they deem them necessary, and, thanks to Chairman Collins, the polluting of streams by sawdust has (almost) been brought to an end. There is much more in the portion of the report here referred to, the perusal of which will repay all trout fishermen.

New State Forester.

Boston, July 3.—Mr. Alfred Akerman was appointed by Governor Bates on Thursday to take charge of the forestry work of the State under the law passed last winter establishing that department. The appointee was graduated at the Georgia State University, studied forestry in Germany and at Yale, and has had experience in the employ of the United States Bureau of Forestry. For the past year he has been Assistant Professor of Forestry in the Yale School. It is understood that the friends of Mr. T. J. Borst, including several officers of the State Forestry Association, are much disappointed because of his failing to receive the appointment. Mr. Borst has been doing forestry work in the State with funds raised by leading members of the State Association for several years. The salary of the position is \$2,000, and the appropriation for carrying on the work the present year is \$5,000.

Good bluefishing is reported in Buzzard's Bay, and ex-President Cleveland has arrived to put in a week with Mr. Jefferson, who is rusticating at his Buttermilk Bay home, known as the Crow's Nest. Mr. Cleveland's family have taken possession of his new summer place at Sandwich, New Hampshire.

At Onset, Captain Edward Robinson one day this week brought in a bluefish that lacked but a few ounces of 16 pounds, said to be the largest that has been taken there for several years.

The residents of Barnstable are keeping a sharp lookout for seiners in the waters of Vineyard Sound.

Visitors at Cottage City are also having sport with the bluefish. Captain W. B. Dawson, with a party on board his launch, The Owl, took 20 handsome fish off Cape Pogue on Tuesday.

Of Massachusetts anglers who have been having fine sport in Maine, "their name is legion." For more than two weeks fly-fishing has been good. Mr. A. D. Thayer,

of Franklin, had his usual good luck at Kineo, from which place he has recently returned. Mr. E. S. Farmer, of Arlington, has been accustomed to pass much of the month of June on Maine lakes for several years. He recently had a long and hard fought battle with an 8-pound salmon at Moosehead, which lasted over two hours, and in which the boat was towed by the fish a distance of two miles. He found on landing him that he was hooked foul just behind the left gill. If any of your readers have had a similar experience they know what it means. At the close of the fight Mr. Farmer acknowledged the was just "done up."

Fishing at the Rangelcy Lakes for the past two weeks and more has been reported excellent, and among those who have taken several large fish is Mr. Cyrus A. Taft, of Whitinsville, well known to your numerous Massachusetts readers, and one of the men who always does his part in promoting the interests of sportsmen. He purchased three dozen quail which he liberated this spring in the vicinity of his town. He also took pains before leaving in the early winter for California to make provision for feeding the birds in his absence. I have a photograph of an ingenious arrangement of his for doing this which I hope to see reproduced in your paper for the benefit of others who are interested in works of charity and mercy toward the feathered creation.

Few anglers of either sex have won greater distinction in angling annals than that recently achieved by a Boston lady, Mrs. N. F. Cowles, who in one hour's fishing took an 8½-pound trout and an 8¼-pound salmon. Several other Boston ladies have had phenomenal success. Evidently men who practice the "gentle art" must look to their laurels.

Chairman Collins started yesterday morning for Kineo to speak before the Maine Sportsmen's Association, which convenes on Monday next.

CENTRAL.

In Colorado Streams.

DENVER, Colo., June 27.—Colorado weather has been so backward that it can be said the fishing season has only begun to open. Streams have been high, bank-full and muddy, and trout have been taking little else but worms. Last week, however, the willow-fly appeared upon the big waters of the Gunnison, and there has been something doing there since. Parson Thomas A. Uzzell, of Denver, came home with a week's catch last Saturday that averaged forty a day. Many of these were rainbows—if indeed they are rainbows—ranging from 2 to 4½ pounds each. He had very few that measured less than 12 inches. Parson Uzzell says the waters were almost "just right," and that the big fellows were about equally divided in their choice between the artificial fly and the willow-fly, now abundant upon the waters. Others in his party who enjoyed somewhat of the same sort of luck, were Harry Davis, W. J. Connaton, and Thomas R. Powell, all of Denver. They went to Iola.

John Montgomery, of Denver, is high line of all the Lyons anglers. Lyons is near-by, being only 55 miles north of the city. Out of the St. Vrain Mr. Montgomery last Saturday in four hours' time captured and kept an even two dozen rainbows, none of which was less than 12 inches long. None weighed less than one pound, and several went above three. A couple weighed four pounds even. The water is low and clear, and trout are avid for flies.

Judge D. C. Beaman, of Denver, goes up to Twin Lakes every Friday night, and returns laden with some truly lunkerish fellows every Monday morning. Twin Lakes was stocked with many Mackinaws some dozen years ago, and Judge Beaman and a half dozen others of the initiated go up there and kill half a dozen or so whenever they choose. The Judge's greatest catch was last week, when he came in with several, the heaviest of which weighed 13½ pounds, and measured 34 inches. He had four others, ranging from 7 to 10 pounds. They were taken on small trolling spoons.

For nearly angling the Platte Cañon is holding its own. Any fair fly-caster can take from 25 to 50 fair sized trout a day, and they have to weigh from half a pound up to several to be counted fair sized. F. T. Fester, of Denver, last Friday landed without net a 6-pound rainbow that gave him a pretty little ten-minute fight. This is the largest Platte Cañon catch so far this season, but the waters are high and the trout are not taking kindly to the fly, as they will later—say two or three weeks hence. Charles Carnehan, of Denver, last Saturday threw back everything less than 12 inches long, and came home with 24 mountain trout and rainbows from Platte Cañon that ran from 12 to 14 inches long. This is the record on the Platte for the season, but it will be eclipsed before the ensuing month rolls by.

The new Denver, Northwestern & Pacific Railroad, the "Moffat Short Line," has opened up a big field for the prowess of the angler and the "man behind the gun," be he after big or little game, feathered game or game with fur. The new road passed through a virgin country that has heretofore been inaccessible except to the hardest of hunters and gold prospectors. The showing of the streams made for the first time yesterday when a horde of anglers invaded the stillness of the forest, indicates that no better trout streams are to be found in the State. F. E. Shipley, a Denverite, killed 58 from Saturday afternoon to Sunday afternoon. The trout range from the legal size, 7 inches, up to 2 and 3½ pounds. Arthur Bush, also of Denver, and an expert with rod and fly, killed 29 of the same general run of those aforementioned. They are found in all sorts of little mountain streams that one may jump across, and not having been trained to know the danger of taking artificial flies, the avid trout simply fall over one another in their efforts to be first into the smoking frying-pan.

I note with pleasure, however, that the new road regards its trout streams as a valuable asset, and have already begun a crusade that insures plenty of good sport for years to come. Before the road pierced the mountains to any extent, the officials had arranged with the State and National hatcheries to work in conjunction for the protection and propagation of game fish. Last summer and thus far this spring these virgin waters have been stocked with over 600,000 fingerlings. They were placed in tributaries of the Fraser River, and are so protected by fallen underbrush that it is impossible to either

seine or dynamite them until they seek deeper waters.

The biggest trout reported killed in a meandering stream to date is credited to Mr. Carpenter, who keeps a sportsmen's lodge on the Gunnison called "Carpenter's." He killed a fine specimen of the *Salmo irideus* last Thursday, after a fight of less than ten minutes. The kill weighed 8½ pounds when taken from the water.

J. D. C.

The Principle of the Thing.

MICHIGAN CITY, Ind., June 28.—*Editor Forest and Stream:* It seems to me that a paper which inculcates a high standard of morals in sportsmanship, as FOREST AND STREAM undoubtedly does, is counteracting its own influence in favor of the honorable observance of game and fish laws when it publishes without a word of censure or anything to indicate even mild disapproval, such a letter as that published in your issue of June 18, signed G. W. Cunningham.

Here is a person who writes as if an account of how he and his friend the Doctor disgraced the name of sportsman by violating the fish laws of Michigan while on a shooting trip to that State, in catching trout out of season, must be very delectable reading for FOREST AND STREAM subscribers. He indulges in a clumsy joke about the fish "all covered with pink spots" being chubs. "Pon my word they were chubs, and nothing else."

While thus engaged in illegal fishing the writer and his friend are seen by a man who comes along in a buggy, but who immediately turns about and drives toward Republic to inform the officers of the law, as they suppose. Probably the man was a subscriber to FOREST AND STREAM, for he evidently desired to have the laws enforced. It is nine miles to Republic, however, and your correspondent is not alarmed—he and his friend have plenty of time to enjoy their fish, and hide the heads and other evidences of guilt "under that wind-shaken spruce stump," and laugh in their sleeves at the futile efforts of the "citified young chap"—presumably a deputy game warden—who visits the camp next day, and is evidently looking for some incriminating evidence, which I, for one, heartily wish he had found.

There are many men who succumb to temptation and violate the game and fish laws occasionally, but not one worthy of being called a sportsman who will boast of it, and try to make a funny story of the incident.

The last paragraph of the letter brings the usual charge: "If they were looking for violators of the fish laws, they could find them most any day among their neighbors and friends."

That is the excuse one often hears, but in most cases the party making the charge has no evidence whatever to support it; and even if true, it is no excuse.

JOHN G. MOTT.

Jersey Coast Fishing.

ASBURY PARK, July 1.—The heavier bass are now running, and while not as numerous as they have frequently been, still each day produces results to some one or more of the patient fraternity. Mrs. Bruere, whom I mentioned as being of the enthusiastic order, for more than ten days held the record for the season at 33 pounds, a most astonishing feat performed by a woman in a boiling sea; and hooked and killed entirely by her own hand while casting from the beach. This is without parallel on our coast, and it is a question if the exploit will be duplicated in a decade. Still, I suppose we may expect anything out of the ordinary from the "new woman" when she goes fishing. I have many times known the strength of sturdy men to be pretty thoroughly exhausted before landing even much smaller specimens. There was much secret hope that the weight would not be exceeded, but to-day Uncle Billy Brumaker, with characteristic luck, stepped in with one of 34 pounds, followed shortly after with one of 23½ pounds. Among the many prizes that are annually offered by the fishing club, a Julius Vom Hofe high-grade reel is the one most coveted, while Seger each year donates a hand-made bass rod.

There was apparently a school of large bass at hand to-day, as eight large fish were hooked in rapid succession, and but three landed; whether the five that got away were the big ones or not must ever be conjectured, but if there was ever a game in which experience, coupled with a cool head and steady hand, was more essential than in bass fishing in the open surf, then I have yet to meet with it. Kingfish are most remarkably scarce; while the catches in the pound nets early in the season were liberal, but few have come within the angler's reach. The season is well advanced for them, and they should now be abundant.

Reports from Barnegat are not as yet reassuring; what fish are being taken, however, are fine in size. I contemplate a trip there over the Fourth, and will know more certainly the conditions existing.

LEONARD HULIT.

Planted Lake Trout.

KEENE, N. H., July 2.—*Editor Forest and Stream:* In reading my paper the other evening, I came across a notice which said, "report your luck to FOREST AND STREAM." Ten miles from here we have a small lake which some years ago was stocked with lake trout, but for some reason they were never fished for till May 2, when three of us, in less than three hours' fishing, took out seven which weighed 42 pounds 3 ounces. The following Thursday we caught seven more, which weighed 37 pounds 13 ounces. The next Tuesday I caught five, which weighed 38 pounds; in all 19 fish weighing 118 pounds in less than ten hours' fishing. Since then there have been about 100 caught, weighing from 2 to 11¾ pounds.

H. R. BEALE.

Staten Island Fishing.

THE past week has been a good one for salt-water anglers in Prince's Bay and at Great Kills very large catches have been made, some boats coming in with as many as 100 fish. The menhaden fishermen are catching more weakfish and bluefish than those that do it in a legal manner; they use the right kind of bait to make a successful catch, but are not caught themselves. ***

Some Camp-Fire Dont's.

Editor Forest and Stream:

Fire every summer plays havoc in our mountain forests, due, in most cases, to neglected camp-fires. By the exercise of reasonable care, much of this annual waste of timber could be prevented.

To aid in the work of prevention the Great Northern Railway Company is sending out to the press a short article, which is inclosed.

The question of forestry is one of the most important now before the country. Many States pay bounties for planting trees, and the general Government is beginning to give the matter of forestry the deep attention it deserves. A fire started from the camp of some careless hunter will do more damage in a day or two than a whole State can repair in years of time, labor, and expense.

Commissioner W. A. Richards, of the General Land Office, has issued circulars warning the public against carelessness, inasmuch as many fires start from neglected camp-fires, and makes the following requests:

1. Do not build a larger fire than you need.
2. Do not build your fires in dense masses of pine leaves, duff, and other combustible material, where the fire is sure to spread.
3. Do not build your fire against large logs, especially rotten logs, where it requires much more work and time to put the fire out than you are willing to expend, and where you are rarely quite certain that the fire is really and completely extinguished.
4. In windy weather and in dangerous places, dig a fire-hole, and clear off a place to secure your fire. You will save wood and trouble.
5. Every camp-fire should be completely put out before leaving the camp.
6. Do not build fires to clear off land, and for other similar purposes, without informing the nearest ranger or the supervisor, so that he may assist you.

F. I. WHITNEY.

On the Clam Flats.

BOSTON.—Joppa-by-the-Merrimac is an interesting place, and is noted for its sharps and flats, which yield a bountiful harvest of the most luscious clams in the sea, and for the most fascinating shell game in the world. A clammer, to be in good and regular standing, must pay the treasurer of Newburyport a license fee of \$5, which gives him the right to dig as many clams as the tides will allow, and which are carried to Boston and elsewhere by the express company in large quantities every morning.

The supply seems inexhaustible, and the more the clammer digs, the more clamorous is the clamor for more, and so the business gives employment to above 200 men, and sustains a large number of families besides. Their little weather-stained shanties line the edge of the flats just above high water mark.

Unlike all fish hogs, they do not grab everything they lay their mud-hooks on; the small clams are carefully sorted and returned to the mud to enjoy life, liberty, and

the pursuit of happiness, for a time, at least. Moreover, the flats are constantly being renewed and fertilized by river deposits, and are of such large area that the clambers are not compelled to dig over the same ground oftener than once a month or more.

J. C. H.

The Frog's Provender.

Editor Forest and Stream:

A friend and myself indulged in a frog hunt. We secured 80 beauties; my 40 dressed 12 pounds 8 ounces of legs. I have been a student of natural history for years, but while dressing those frogs learned more frog lore than years of reading and observation had developed. After removing the head of a frog as a humane act previous to amputation, I discovered feathers protruding from the throat. When the stomach was opened, we found a downy woodpecker that measured 10 inches from tip to tip, and 6 inches from end of bill to tip of tail. In another frog was the wing of a somewhat larger bird, species unrecognizable. In another a 3-inch bullhead. In others were crabs and water bugs, the bugs being hard-shelled and two sizes larger than a silver quarter. In another was a frog quite 4 inches long. I am wondering if the frog had climbed a tree and shaken the woodpecker out.

Did any of the FOREST AND STREAM family ever meet with a similar occurrence? If so, let them rise up at once and help me bear part of the burden, as people smile a broad smile when I tell my story.

A. A. PIATT, M.D.

Suspended Animation.

SOME years ago I remember having the temerity to tell a story of how, when I was but a little chap, I went into the kitchen one day and watching some frozen smelts "come to life" in a pan of water, and I was so heartily laughed at that I never repeated the story. Mr. Chambers' article in the issue of May 11 gives me courage. Now I reassert that I certainly did see those frozen smelts swim and show all signs of life after being in the tepid water for a short time.

I was in St. Louis last week, and met there one who for years had dealt largely in fish. He assured me that to his own knowledge bullheads frozen as stiff as a board, when put into water and thawed out had "come to," and showed all evidences of being live, up-to-date fish. He explained that dead fish frozen and live fish frozen are two different propositions. The former are dead for keeps, but the latter will "come to life" if given a chance.

I would like to hear from others on this subject of frozen fish "coming to."

CHARLES CRISTADORO.

Teacher Proves Jonah Story.

PITTSBURG, Pa.—The largest Bible class in the city at the East Liberty Presbyterian church, is convinced that Jonah was swallowed by a whale and coughed up again. James I. Buchanan, bank president, and president of the

Pittsburg Orchestra, is teacher of the class. Eight years ago he read a story in a New Zealand paper to the effect that a seaman had been swallowed by a whale and spit out again alive. He questioned his cousin, George Garvis, who had sailed in New Zealand waters, on the story, who told him it was absolutely correct. Mr. Buchanan pasted the clipping in his Bible, and waited eight years before he got a chance to use it. The Jonah story was the subject of the last Sunday lesson. Mr. Buchanan said: "Every anti-believer in the whale story was brought to believe it on the strength of that newspaper clipping after having doubted the Bible story."

Native Hook from Rhodesia.

MR. FRANK H. KELLAND sends me from Northeastern Rhodesia a very curious native eyed fishhook used by the Waunga tribe (Bangweilo East). It is wonderfully good

temper, and the method of knotting the plaited line is interesting. A fish which swallowed a bait with this hook in it would never get away. The pull is direct on the point.—London Fishing Gazette.

100 Sportsmen's Finds.

Some of the Queer Discoveries Made by Those Who Are Looking for Game or Fish.

98

WEST ORANGE, N. J.—Councilman Thomas Gannon returned yesterday from a fishing trip at the summer residence of Councilman-at-Large Simeon H. Rollinson, River Farm, Pine Brook. Mr. Gannon succeeded in landing a number of the fish, including a large carp. In cleaning the fish, Mr. Gannon was about to cast three hard lumps he excavated from the depths of the fish back into the water, when he noticed they bore a pinkish tint. He found on examination that they were three pearls, "resembling those found off the coast of India, in and around the Maldiva and Laccadive Islands." The pearls have been examined by a local jeweler, and have been declared to be fine stones.—New York Times.

White Bear Lake.

Preliminary Seawanhaka Trials.

THE preliminary Seawanhaka trials that were held June 20, 21 and 22, went off very successfully. The committee was very fortunate in having three days of first-class wind and practically no break-downs.

Six boats in all were entered for the trials; the only one from away being Wihuja, designed and built by Ande Peterson, of Minnetonka. She is a very powerful scow, being 8ft. 2in. beam and 38ft. over all, and proved to be a first-class boat and superior to all the others in a heavy wind. She was well sailed throughout the races, and it was a great pleasure to the White Bear men to meet old rivals after a long interval of indifference on the part of Minnetonka racing.

The crew of Wihuja during the trial was James Loudon, tiller; Gale Merrick, main sheet; Charles Chalmers, jib; and Hugh Loudon, fourth man.

In breezes under ten knots, Alpha and Beta showed better speed, but in anything above the larger and more powerful Wihuja was clearly the best. The other boats that took part in the races were Alpha, designed by C. D. Mower, and built by Gus Amundson. She was sailed by L. P. Ordway, with T. L. Wann at the main sheet, Jack Ordway, jib, and Sam Ordway, fourth man. The third was Beta, designed by B. B. Crowninshield, and built by J. O. Johnson. She was sailed by C. M. Griggs, with J. Johnson at the main sheet, Evan Rees, jib, and W. Murray. Seeress sailed the first day, but after that the Beta used her sail. Seeress was manned by Evan Rees, R. K. Armstrong, William Rees and A. L. Preston.

Moccasin was built and designed by Gus Amundson. She is owned by the Frye Brothers and sailed by Henry Frye, Robert Burns, Leslie Murray and Tom O'Regan. Gamma, designed by Dr. J. M. Welch and built by Dingle, was sailed by Dr. Welch, Leanitt

Corning, H. H. Merrill and Carl Schuneman.

Through unavoidable delay the large Crowninshield boat was not completed in time to take part in the preliminary races. She will be ready the first of the week and will be tried out against Wihuja and Alpha. Commencing on the 27th, the Oshkosh Club will hold similar trials for boats in that section. There will be at least four entries from Lake Winnebago and probably one or two from neighboring lakes, so that these trials should be very interesting. About July 5, the White Bear Club will ship down to Lake Winnebago two or three of the boats that have made the best showing here and try out individually against the boats that made the best showing in the Oshkosh trials. The principal reason for going to this additional trouble and expense is to have a chance to test out boats of different designs and power on the larger waters of Lake Winnebago.

JACK ORDWAY.

First Day, June 20.

In a 15-mile breeze the crack Minnetonka yacht won out in a double event over the White Bear boats in the first day's trials for the selection of a challenger for the Seawanhaka cup. Her victory is all the more notable from the fact that in the first race she broke the jaw of her gaff immediately after the start, and sent a man aloft to make temporary repairs while under full headway.

While the White Bear men are not seeking excuses, and for the most part are glad of the success of the Minnetonka boat, certain facts as to the condition of some of the local boats cannot be overlooked. In the first race Beta went out with a sail entirely too baggy for good work. Gamma was seriously troubled with her rudders and forced to withdraw after going two miles. Alpha broke her jib halliard in the second race while holding a position and was compelled to lay to, and her endeavor to race with the boats as they rounded the course the second time proved futile, for

the reason that the hasty repairs would not permit of even fair windward work.

The wind was blowing strong and squally from the W. It offered the right sort of test for the boats, and was just what the skippers were looking for. Two boats went out with one reef laid away, while the others went out full sail.

The arrangement of the day was decided upon and the boats were paired off as follows: Moccasin was to sail against Beta, Alpha against Gamma and Seeress against Wihuja. The judges' launch anchored at the starting line. Tarbox fired the preparatory gun at 2:10. Moccasin and Beta tried for position. Moccasin crossing 12s. after the starting gun, being 15s. ahead of Beta. The pressure of the wind on their sails showed itself immediately. Time and again they laid over until the lee rails were deep in the water.

Half way down to center Griggs overhauled Fry and the two raced down to the first mark together. They turned the buoy only 4s. apart, Moccasin leading by two boat lengths. Pinning sheets into the wind Moccasin increased her lead by several lengths, but it was not long before Griggs got his boat going to his liking and splitting tacks with Fry soon ran into the lead, which was held to the finish, beating Moccasin by 4m. and 42s.

Alpha and Gamma were started at 3:20. Gamma was not in position as the gun sounded, but Ordway waited for her. They crossed 2s. apart, with Gamma leading. They had gone less than a quarter of a mile before Ordway was seen to tear away from Dr. Welch. Gamma's rudders were entirely too small to keep the boat headed properly, and after going two miles Dr. Welch obtained the judges' consent to withdraw. Alpha continued her course, which she completed in 56m. and 36s.

Seeress and Wihuja were sent off at 3:25. Seeress misjudged the gun and was not in position when it sounded. Wihuja crossed 10s. after the gun and Seeress 20s. later. Seeress did not seem to gather her

usual speed, while Wihuja was only touching the high spots. On they went to center, Seeress footing better after she had traveled a quarter of a mile. Wihuja made the buoy in an even 6m., while it took Seeress 7m. On the beat to Clark street Loudon gained 20s. on Seeress and increased it 1m. and 9s. more on the two-mile run to Wildwood. Back to center Seeress began to close, and cut down the lead of the Minnetonka flyer 1m. and 6s., but lost 2s. on the fast reach home. Summary of races:

	Elapsed.	Corrected.
First Division.		
Beta, C. M. Griggs.....	0 58 43	0 59 10
Moccasin, C. Fry.....	1 03 30	1 03 42
Second Division.		
Alpha, L. P. Ordway.....	0 56 04	0 56 36
Gamma, Dr. J. M. Welch.....	Did not finish.	
Third Division.		
Wihuja, J. Loudon.....	0 53 30	0 53 40
Seeress, E. Rces.....	0 54 55	0 55 25

The following table shows the actual elapsed time of each of the boats between each buoy, the distance between second and third buoys being two miles and the others one mile:

	1st buoy.	2d buoy.	3d buoy.	4th buoy.	5th buoy.
Beta.....	0 06 47	0 17 16	0 14 45	0 12 10	0 06 45
Moccasin.....	0 06 58	0 18 40	0 16 45	0 11 55	0 08 12
Alpha.....	0 06 08	0 16 48	0 14 52	0 10 55	0 07 21
Gamma.....	0 06 50	0 18 40			
Seeress.....	0 07 00	0 16 02	0 14 23	0 10 10	0 07 20
Wihuja.....	0 06 00	0 15 42	0 13 14	0 11 16	0 07 18

After a lay up of half an hour in which time Beta dressed herself in Seeress' mainsail and Wihuja used Gamma's gaff to replace her broken one, the winners in each of the divisions were sent down to Wildwood to start in an eight-mile race. The preparatory gun was fired at 4:39 and the starting gun 5m. later. The start was ragged, Alpha crossing 10s. after the gun, 6s. ahead of Beta and 40s. ahead of Wihuja. The latter did not suffer by her poor start, however, for she immediately sailed up to the others and the three boats were well together when Alpha's jib halliard gave way, which put her out of the race.

Wihuja bent down to her work in grand style, meeting the heavy puffs admirably and seeming to pull away from Beta every moment.

It was a long beat of two miles to the Clark street buoy, and Wihuja sailed it in 25m. and 28s., 2m. and 22s. ahead of Beta. The Minnetonka boat lost 1s. on the run back to Wildwood, but made a further gain of 57s. on the beat the second time up the lake, losing 46s. as the boats made their last run to the finishing line. Wihuja covered the 8-mile course in 1:17:40 actual time. Beta covered it in 1:20:12.

The race demonstrated that Wihuja was faster on windward work, but lost twice on running. The first beat she opened a lead of 2m. and 22s. on Beta, while the second beat she gained only 57s. Summaries:

	Elapsed.	Corrected.
Wihuja, J. Loudon.....	1 17 40	1 18 30
Beta, C. M. Griggs.....	1 20 12	1 20 28
Alpha, L. P. Ordway.....	Disabled.	

Here is the time between each leg:

	2 miles.	4 miles.	6 miles.	8 miles.
Wihuja.....	0 25 28	0 13 16	0 25 00	0 13 56
Beta.....	0 27 50	0 13 15	0 25 57	0 13 10

Judges, H. P. Clark, H. C. Drake; starter, Tarbox; timekeeper, Dresen.

Second Day, June 21.

It was a boat of another color that won the honors in the second day's trials of the Seawanhaka challengers on White Bear Tuesday afternoon. The Minnetonka boat tasted defeat twice yesterday, winning once. Alpha won all three of her races, and Beta won one and lost one. Moccasin and Gamma, although making a good showing, did not manage to win.

The wind had sheered around several points toward the N. from the day before, and was blowing decidedly squally, about 12 miles an hour when the boats tried for the first race. During the other two races it moderated considerably.

Yachting sharps, who had a strong leaning toward Wihuja after the Monday races, are not quite so sure of their choice since witnessing the trials yesterday. The White Bear boats showed improvement in form all around, and are nicely working into good racing shape.

So far, Wihuja seems to be the peer of the other fellows when the wind pipes, but in a moderate breeze they all have a chance with her, and in a light wind they can beat her.

Judging from the efforts of the White Bear Y. C. to construct a fleet of boats whose chief virtues are power, it is reasonable to believe that they were looking for a boat which will stand the strain of a heavy pressure and win out. There is not the slightest question of Wihuja's ability to stand up and to foot, yet the improved form which Alpha showed yesterday puts her bang up with the Minnetonka flyer and forces her into the reckoning.

The races yesterday were closer and of a more spectacular turn than those of the day before. In the first race Alpha sailed against Gamma and won. Beta sailed against Wihuja and Moccasin, the boats finishing as named.

In the second race Alpha sailed against Gamma and won. Beta sailed against Wihuja and Moccasin, the boats finishing as named.

In the second race Alpha sailed against Beta, and, after one of the most spirited contests ever witnessed on the lake, finished 1s. and 52s. in the lead. Wihuja beat Moccasin and Gamma.

In the third race Alpha, Wihuja and Gamma took part. Alpha finishing first, Gamma second and Wihuja third.

First Race Starts.

The preparatory gun for the first race was fired at 2:42. The course was laid out from a point on the S.W. part of Dellwood to Wildwood, a distance of 2 miles, with the first leg to leeward and the returning to windward. Alpha, Capt. Ordway, and Gamma, Capt. Welch, were the first to start. Alpha went over the line 10s. in the lead and showed the way down to Wildwood. They rounded the buoy 20s. apart, Welch having lost 10s. on the run down. Back into the wind

Alpha opened more water and made the 2 miles of windward work in 26m. and 17s., while it took Gamma 27m. and 58s.

Wihuja, Beta and Moccasin were entered in the next division. Wihuja set her spinnaker in the line-up and crossed the starting 2s. ahead of the gun and the judges called her back, requiring her to recross, which she did, losing 1m. and 36s. in doing so. Beta and Moccasin were well under way with spinnakers flying and shooting down on a straight line to the Wildwood mark. Wihuja set a hot chase after them and caught Moccasin before rounding Wildwood, but Beta increased her lead off the wind by 1m. and 5s. As the boats hauled into the wind Wihuja began to close on Beta and made up 1m. and 18s. Beta was too far away, however, for the Minnetonka boat to overtake her, and they finished in that order. Moccasin struggled on the windward leg and lost time. The summary:

	Elapsed.	Corrected.
First Division.		
Alpha.....	0 45 12	0 45 27
Gamma.....	0 47 03	0 47 28
Second Division.		
Beta.....	0 41 41	0 41 47
Wihuja.....	0 41 28	0 43 34
Moccasin.....	0 44 04	0 44 26

On actual time Wihuja covered the course 13s. faster than Beta, but the official time gives the race to Beta by 1m. 17s.

The second race was sailed immediately after the first was finished. Alpha and Beta raced against each other, while Wihuja, Moccasin and Gamma brought up the other division. The course was the same as the previous one.

Alpha went over the line 7s. in front of Beta. Capt. Griggs overhauled Ordway on the run down the lake. As they brought down their spinnakers and hauled into the wind, the two old rivals fought it out for the windward berth. Time and again they forced each other until they threatened to run up high and dry on the south shore. Once it was Griggs to windward, the next time it would be Ordway. The luffing continued almost indefinitely, and the other boats which started 5m. later were rapidly catching up. Finally Ordway succeeded in pulling away and led to the finishing line. At the final buoy he was forced to make a short tack by reason of the judges' launch which anchored to the mark, having dragged the buoy slightly out of place. This lost Ordway at least 15s.

Wihuja, Moccasin and Gamma went off on almost even terms, and proved highly interesting to the finish. Down they went before the wind, all three abreast, their spinnakers off to starboard and their mainsails to port. Gamma rounded the buoy first, Wihuja next and Moccasin third, close together. Gamma opened up a considerable lead. The wind had moderated somewhat, and Dr. Welch was outpointing and outfooting the Loudon and Fry boats. This was true until the boats reached a point near the center buoy, when the wind grew stronger and the Wihuja surely and steadily crept up to the leader. She closed rapidly and, after a long port tack up the west shore of the peninsula, came about and crossed Gamma's bow.

Dr. Welch seemed to be partly to blame for Wihuja overtaking him. By previous good sailing he managed to creep up to Alpha and Beta, which had started 5m. ahead, and engaged with them in the fight for the windward position. He was at their mercy, however, for they were already to windward, and between the two of them Welch could not pick his way through. In the meantime Wihuja was fairly flying along, with no interference whatever. Summary of second race:

	Elapsed.	Corrected.
First Division.		
Alpha.....	0 48 01	0 48 12
Beta.....	0 49 46	0 50 04
Second Division.		
Wihuja.....	0 42 38	0 43 15
Gamma.....	0 44 56	0 45 28
Moccasin.....	0 49 10	0 49 50

The third and best race of the day was sailed shortly after 5 o'clock, Alpha, Gamma and Wihuja starting. The course was 4 miles, from Dellwood to Wildwood and return. The wind at this time was blowing about 6 miles.

Third Day, June 22.

The races are practically completed so far as the trials on White Bear are concerned, and Wihuja will be sent to Oskosh, together with Alpha, where additional trials will be held between these two and the two other boats which the club is building and which have not thus far been placed in the water.

The Loudon brothers, who own Wihuja, formally turned their boat over to the special regatta committee of the White Bear Club late yesterday afternoon, and Beta will be sent to Minnetonka for their use until their boat is finally returned to them. The crew of Wihuja won the admiration and friendship of the local yachtsmen through the skillful handling of their craft in the races and their gentlemanly conduct while on shore.

The Loudon boat was not to share the honors of the day alone, for Alpha pinned a new feather to her hat by establishing a record for one knot, which she did on the close reach from Wildwood to center, covering the distance in 4m. and 56s., while Wihuja, which was leading her at the time, made it in 5m. and 34s. This record is apt to stand for some time, and is one which will require a strong wind and an exceptionally fast boat to beat. In nearly all her free work and reaches Alpha outsailed, or at least held her own, against Wihuja, while the Minnetonka boat proved her superiority on windward work.

The drawing for the line-up of the first race resulted as follows: Alpha was to sail against Gamma, and Moccasin was to sail the course alone. Alpha and Beta were sent off first, and to a good start stood away on a port tack to the island. Alpha was outpointing and outfooting Beta, and rounded the first mark 1m. and 10s. in the lead. The close haul to Wildwood saw no change in position, although Alpha increased her lead by 10s. Back to center Beta was making slight gains by reason of her balloon jib, but Ordway still showed a safe lead. At the center buoy they were

more than a hundred yards apart, Beta plunging and staggering under her heavy spread of canvas.

Griggs managed to keep her righted and showed some gains until she struck a new slant of wind to which her sails could not be adjusted quick enough, and capsized. Alpha did not finish the course.

Moccasin, starting on the second gun, was covering the course alone, while Wihuja and Gamma, which started 5m. later, were next to show. Wihuja never gave Dr. Welch's boat a chance to get near her, drawing away immediately after the start and opening a good sized lead to the first mark. The windward leg did not seem to trouble Wihuja in the least, and the harder the wind blew the better she liked it.

A minute and a half separated them at the center, but Gamma cut it down by 26s. on the haul to Wildwood, though she showed a big loss on the close reach to Clark street. Back to center it was give and take, with no apparent change in positions, and on the run home with spinnakers flying, Wihuja held Gamma down without a loss, crossing the line a winner by 2m. and 45s. Moccasin, in sailing alone, covered the course in 54m. and 21s., which was 4m. and 41s. slower than Wihuja's time.

In the next race Alpha and Wihuja paired off, Gamma and Moccasin, Alpha and Wihuja made the best start of the week, going over just as the gun sounded. They were both lapped together, with Wihuja to windward. They stood away on the port tack, but Wihuja, finding she could not keep her weather berth and pass Ordway, went about and split with Alpha. When they finally came together again on converging tacks, Wihuja's windward qualities had stood her well, and she crossed Alpha's bow with considerable to spare.

Alpha Makes Record.

To the first mark she increased it to 1m. and 18s., and adding 36s. more on the close haul to Wildwood. It was on the return from Wildwood to center that Alpha performed her record-breaking feat in her attempt to catch Wihuja, and she sailed the distance in 38s. better time than the Minnetonka crack. From center to Clark street she added 17s. more, but lost 18s. from Clark to center, and a like number on the spinnaker run home.

Moccasin succeeded in winning her first race in the trials by defeating Gamma in the second division. It was a nip-and-tuck affair for the whole distance, but Fry had the better of the argument after they rounded center, and maintained his advantage to the finish, winning by 31s.

This ended the racing of the series, and the special cup which was offered for the winner of the trials will now rest on a new pedestal in the club house of the Minnetonka Boat Club, which Wihuja represents. The summary of the day's racing follows:

First Race—First Division.

	Elapsed.
Alpha, L. P. Ordway.....	Did not finish.
Beta, C. M. Griggs.....	Capsized.

Second Division.

Moccasin, Henry Fry.....	0 54 21

Canarsie Y. C.

Jamaica Bay—Sunday, June 26.

THE Canarsie Y. C. held a race on Sunday, June 26. A good S. by W. breeze made the racing interesting. The boats raced for prizes offered by Commodore Northbridge, Vice-Commodore Lounsbury and Fleet Captain Fitzmaurice. On account of low water in the middle of the day, it was late when the race was started. Eleven yachts entered, and made up a fairly good sized fleet. The course was from off the club house to a flagged buoy off Canarsie Landing; thence through the breakwater to Main Channel; to a stakeboat near Spring Creek; to starting line. The boats covered the course twice. The winners were Mystery, Lassie, Klyo, Aurora, and Pauline. The summary:

	Start.	Finish.	Elapsed.
Sloops.			
Lassie.....	4 26 28	6 23 33	1 57 05

Shattemuc Yacht and Canoe Club.

Hudson River—Saturday, June 25.

THE third power boat race of the Shattemuc Y. and C. C. was held on the Hudson River, of Ossining, on Saturday, June 25. Sioux was first and Teddy second in Class E. Spry won in Class D.

The series cup winners are as follows: Class C—Senta, F. G. Mead, owner; Class D—Spry, H. M. Carpenter, owner; Class E—Sioux, L. H. Soule, owner.

The regatta committee was made up of Wm. M. Carpenter, chairman; W. E. Barlow and Robert T. Dennis.

The summary of the race held on June 25 follows:

	Class E—Start, 3:05.	Elapsed.	Corrected.
Finish.			
Robin, Wm. M. Carpenter.....	4 14 50	1 09 50	1 09 50
Florence, Mezger & Dennis.....	4 15 20	1 10 20	1 10 20
Sioux, Louis H. Soule.....	4 12 38	1 07 38	1 01 50
Teddy, J. H. Carpenter.....	4 19 48	1 14 48	1 07 36

Class D—Start, 3:10.			
Getty, Morris Vail.....	4 46 12	1 36 12	1 36 12
Spry, H. M. Carpenter.....	4 43 41	1 33 41	1 31 23

Manhasset Bay Challenge Cup Races.

Port Washington—Long Island Sound.

The second series of races for the Manhasset Bay challenge cup commenced on Monday, June 27, and continued through the week. The cup was competed for last year for the first time, and the event was most successful. There were seven starters besides the defender, Alert, these boats representing a like number of clubs. The races awakened very general interest, and the series proved an unequalled success. Alert successfully defended the cup. She made such a good showing that she was again chosen to defend the trophy.

Fewer challenges were received this year, and the races did not awaken such widespread interest. This was not surprising, as it is decidedly an "off season" for yachting, and little or no interest is taken in the racing.

Bobtail and Nike (ex-Oiseau), two of the challengers, competed last year's races. Nike, then owned by Mr. Harry L. Maxwell, made the better showing of the two. She finished third in the series. Bobtail finished fourth. Alert, Nike and Bobtail were designed and built by the Herreshoff Mfg. Co. Nike is the oldest of the trio, and has been raced steadily and successfully ever since she came out. Alert and Bobtail were designed for special class racing at Bar Harbor.

Mimosa, a Crowninshield boat, was also in last year's races; she finished fifth in the series.

The following particulars regarding defender and challengers may prove of interest:

	O.A.	W.L.	B.	D.
Alert (C.B.), J. W. Alker.....	42	28	9.4	4
Mimosa (Keel), T. L. Park.....	39.6	25.6	9.3	6.6
Bobtail (C.B.), E. F. Luckenbach.....	40.4	26.4	9.3	4.3
Nike (Keel), V. I. Cumnock.....	42	25.4	10	6.6

Woglinde, a Crowninshield boat that was to have represented the Shelter Island Y. C., did not show up. Arrow, owned by Mr. T. R. Macy, was also to start, but her owner was unable to leave college to sail the boat in the races.

Messrs. Walter C. Kerr, W. Butler Duncan and Alexander E. Orr, Jr., were in charge of the races. Commodore A. H. Alker's steam yacht Florence was used as a committee boat.

First Day—Monday, June 27—First Race.

The first race, sailed over a windward and leeward course, on Monday, was hardly a satisfactory one, and Mimosa surprised every one by winning. She was considered less dangerous than any of the other competitors, but she has been immensely improved during the past winter by slight changes. Under the new rule she measures well down, and all the other boats had to give her time. Under the rule, Bobtail measures highest, and in consequence is scratch boat. Over a 16-mile course she has to allow Alert 33s., Nike 1m. 40s., and Mimosa 4m. 50s.

A good full sail N.W. breeze had been blowing all the morning, but as the day wore on it lost strength. The race committee anchored Florence off Horseshoe Harbor, making the starting line there. The course signalled was S.E. ½ S., 4 miles to and around the buoy off Bucks Point, in Hempstead Harbor.

It was a down-the-wind start, and at 1:25 the boats were sent away. Mimosa was first away, less than half a minute after the signal; Alert followed a few seconds later, then came Nike, Bobtail crossed last, nearly a minute after the signal. Alert was the first to set her spinnaker, which was broken out to port. Nike and Mimosa made the mistake of setting their spinnakers to starboard, and it was necessary for them to reset them to port. Bobtail's crew lost considerable time in breaking out their light sails. As soon as they were drawing this boat began to move along fast, and get out from under her competitors.

The wind at the start was N.W. ½ W., and had a strength of 6 to 7 miles; but from the time the boats started, kept losing strength. The tide was running ebb.

Bobtail drew ahead of Alert and Nike passed Mimosa. The boats gybed around the mark in the order named. The times for the first leg follow:

	Start, 1:25:	Outer Mark.	Elapsed.
Bobtail	2 09 25	0 44 25	
Alert	2 11 42	0 46 42	
Nike	2 13 41	0 48 41	
Mimosa	2 14 57	0 49 57	

Bobtail beat Alert 2m. 17s.; Nike, 4m. 16s.; Mimosa, 5m. 32s.

Sheets were gotten well down for the 4-mile beat, but the wind was so light that it was slow going. Bobtail and Nike took the starboard tack and stood inshore toward Motts Point. Mimosa went off luck hunting, an old trick of hers, and this time it worked. Alert made a gain on the windward work, for when she came together with Bobtail, she crossed her bows. The breeze was very puffy, and Alert was favored a little. Mimosa got a big lift by taking a long tack off to the eastward. She not only crossed Nike and Bobtail, but Alert as well, and took the lead of the fleet. She did not keep it for long, and Alert, helped by a favorite puff, pulled into the lead again. The wind had veered to the N. a little, and all the boats except Mimosa overstood the mark. The times for the windward leg follow:

	Outer Mark.	Home Mark.	Elapsed.
Alert	2 11 42	3 30 30	1 18 48
Mimosa	2 14 57	3 31 18	1 16 21
Bobtail	2 09 25	3 31 37	1 22 12
Nike	2 13 41	3 32 54	1 19 13

Mimosa beat Alert 2m. 27s.; Nike, 2m. 52s.; Bobtail 5m. 51s. Alert beat Bobtail 3m. 24s.; Nike, 25s.

The change in the wind made this leg a reach instead of a run, and ballooners were broken out. Bobtail again had an opportunity to show her light weather qualities, and pulled up with Alert. The other pair, Mimosa and Nike, were close together, a little further to the eastward. As the boats got over toward Hempstead they lost the breeze altogether, and for a time did not have steerage way. Bobtail had a nice lead when she rounded the mark. Mimosa was second, with Nike third and Alert last. The table for this leg follows:

	Home Mark.	Outer Mark.	Elapsed.
Bobtail	3 31 37	4 47 34	1 15 57
Mimosa	3 31 18	4 49 33	1 18 15
Nike	3 32 54	4 50 25	1 17 31
Alert	3 30 30	4 52 16	1 21 46

Bobtail beat Mimosa 2m. 18s.; Nike, 1m. 34s.; Alert 5m. 39s.

The boats were able to carry their ballooners to starboard, as the change of wind made it a reach. Even with light sails the boats were making but little headway. Another shift of the wind enabled the boats to set spinnakers and make better time. Bobtail was the first to finish, Mimosa next, Alert third and Nike last. All four finished within less than a minute of one another. The times over the last leg follow:

	Outer Mark.	Finish.	Elapsed.
Bobtail	4 47 34	6 00 56	1 13 22
Mimosa	4 49 33	6 01 10	1 11 17
Alert	4 52 16	6 02 33	1 09 17
Nike	4 50 25	6 01 40	1 11 15

Alert beat Nike 1m. 58s.; Mimosa, 2m. 20s.; Bobtail, 4m. 5s.

Although the results of the race were not satisfactory, it was seen that, with the amount of time Mimosa received from Bobtail and Alert, her chances of winning were very good.

The boats finished 25m. before the time limit of five hours expired.

The summary of the race follows:

	Start, 1:25	Finish.	Elapsed.	Corrected.
Bobtail	6 00 56	4 35 56	4 35 56	
Mimosa	6 01 10	4 36 10	4 31 20	
Alert	6 01 33	4 36 33	4 36 00	
Nike	6 01 40	4 36 40	4 35 00	

Mimosa beat Nike on corrected time 3m. 40s.; Bobtail, 4m. 36s.; Alert, 4m. 40s. Bobtail beat Mimosa on elapsed time 14s.; Alert, 37s.; Nike, 44s.

Alert was sailed by Mr. Harry L. Maxwell, who handled her in an extremely clever manner.

Second Day—Tuesday, June 28.

The four contestants were unable to finish the race within the five-hour time limit on Tuesday, and the race was called off.

Third Day—Wednesday, June 29.

On Wednesday another attempt was made to sail the triangular race, but without success.

Fourth Day, Thursday, June 30—Second Race.

After two unsatisfactory racing days—so unsatisfactory in fact that the races were not finished on either occasion—the owners and crews of the four competing boats were losing interest. A fine sailing breeze revived the failing enthusiasm on Thursday, and the boats had a chance to show what they could do in a two-reach wind.

The race was over a 21½-mile triangular course, which was rather long, and the impression on all the boats was that 15 miles would have been ample. Over this course, Bobtail, the scratch boat, had to allow Alert 45s. and Mimosa 6m. 34s.

Bobtail, the light weather boat of the fleet, was badly beaten. She was sailed, however, very short handed, there being only two aboard beside the paid hand.

The morning was dull, and occasional showers made matters more uncomfortable. Still, there was a little air stirring from the S.W., which continued to increase until by noon there was a fine sailing breeze. The sun came out and the day turned out fine and clear, with conditions most satisfactory for racing.

The steam yacht Florence, with the regatta committee on board, took up her position off Execution and set course signals before 1 o'clock. The S.S.W. breeze was steadily gaining strength, and the contestants had all the sail they could swing to. The first leg was a reach to Matinicock buoy, a distance of 4½ miles.

The starting signal was heard at 1:25. Alert was nicely placed by Mr. Maxwell on the weather end of the line, but she went over a few seconds ahead of the signal. Alert was brought around quickly, and she recrossed, the last boat. Bobtail crossed first, Mimosa second, Nike third. Booms were eased off to port and ballooners were broken out. All the boats were carrying too much sail, three reefs would have been more comfortable and much better time would have been made. All four were steering very hard, and in the puffs they buried badly, even with sheets eased well off. Mimosa, with her fine ends and deep draft, was doing rather better than the rest.

Alert moved fast and soon made up the 30s. she lost at the start. She passed Bobtail to windward and Nike to leeward. Nike carried away her balloon jib sheet and soon her crew had that piece of canvas below decks. She went much better without it, and drew away from Mimosa. The other skippers made a great mistake by not taking in their ballooners when Nike doused hers. Alert was the next boat to take in her balloon, and she steered better and moved faster afterward.

Vicious puffs drew out of Hempstead Bay and laid the boats out badly, making it necessary to almost constantly slack off sheets in order to keep them on their course. Alert was the first to gybe around the Matinicock buoy. The time for the first reach follows:

	Start, 1:25:	First Mark.	Elapsed.
Alert	2 01 33	2 01 33	0 36 33
Bobtail	2 02 04	2 02 04	0 37 04
Nike	2 02 35	2 02 35	0 37 35
Mimosa	2 03 00	2 03 00	0 38 00

Alert beat Bobtail 31s.; Nike, 1m. 2s.; Mimosa, 1m. 27s.

It was a reach with booms to starboard to the next mark on Scotch Caps, a distance of 3¼ miles. Alert made a good gybe, although she was short one hand. Bobtail was the second boat around, and her working jib was substituted for her balloon. She did better after making the change. Mimosa's crew had great difficulty in trimming her balloon; in fact, the boat was brought almost up in the wind before it could be flattened. Bobtail closed up on Alert a little on this leg. The times for the second leg follow:

	First Mark.	Second Mark.	Elapsed.
Alert	2 01 33	2 27 00	0 25 27
Bobtail	2 02 44	2 27 51	0 25 47
Nike	2 02 35	2 29 07	0 26 32
Mimosa	2 03 00	2 29 13	0 26 13

Alert beat Bobtail 20s.; Nike, 1m. 5s.; Mimosa, 46s.

The third leg was a beat. It was a long and a short leg to the mark off Execution, a distance of 2½ miles. Alert made her big gains on the windward work, and although she did not carry her sail any better than the rest, she drew away very fast. Nike sprung her masthead ten minutes after rounding and was obliged to run under her jib into the American Y. C. at Milton Point. This was unfortunate, as she was going well and stood a good chance for second place. Mimosa made decided gains on Bobtail, which boat was not at her best, as the wind was rather too fresh for her. The times for the third leg follow:

	Second Mark.	Home Mark.	Elapsed.
Alert	2 27 00	3 01 48	0 34 48
Bobtail	2 27 51	3 06 19	0 38 28
Mimosa	2 29 13	3 07 28	0 38 07
Nike	2 29 07	Disabled.	

Alert beat Bobtail 3m. 40s.; Mimosa, 3m. 19s. Alert led Bobtail 4m. 31s., and Mimosa 5m. 32s. at the end of the first round.

With working jibs set in place of ballooners, the boats did better on the first leg of the second round. Even so, they had all they wanted of it in the hard puffs, and at times were pretty well smothered. Alert gained on Bobtail, while Mimosa closed up a little. The times at the first mark:

	Home Mark.	First Mark.	Elapsed.
Alert	3 01 48	3 35 30	0 33 42
Bobtail	3 06 19	3 40 48	0 34 29
Mimosa	3 07 20	3 42 07	0 34 47

Alert beat Bobtail 47s.; Mimosa, 1m. 5s. q

Mimosa made better time on the second leg than Alert did. Mimosa has never been considered dangerous in a breeze, but the form she was sailing in showed that a true line has never been gotten on her speed. The changes made in Mimosa have improved her under all conditions, and her owner is getting rather more out of her than he did last season. The wind had steadily increased as the day wore on, and it was blowing hard. Sheets were eased off until booms were in the water. The times for the second leg were:

	First Mark.	Second Mark.	Elapsed.
Alert	3 35 30	4 02 25	0 26 55
Bobtail	3 40 48	4 08 10	0 27 22
Mimosa	3 42 07	4 08 40	0 26 33

Mimosa beat Alert 22s.; Bobtail, 49s. Alert beat Bobtail 27s.

As soon as the boats were hauled on the wind again, Alert began to put open water between herself and her competitors. Mimosa moved along well and passed well to windward of Bobtail. The latter boat was dead. She could not carry her sail at all, and her mainsail was so far off that it had no drawing power. The times for the last leg were:

	Second Mark.	Finish.	Elapsed.
Alert	4 02 25	4 38 32	0 36 07
Mimosa	4 08 10	4 46 27	0 37 17
Bobtail	4 08 40	4 52 45	0 44 05

Alert beat Mimosa 2m. 10s.; Bobtail, 7m. 58s.

The next race will be sailed over a windward and leeward course on Tuesday, July 5.

The summary of the race follows:

	Start, 1:25:	Finish.	Elapsed.	Corrected.
Alert	4 38 32	3 13 32	3 12 47	
Mimosa	4 46 27	3 21 27	3 14 53	
Bobtail	4 52 45	3 27 45	3 27 45	
Nike	Disabled.			

Alert beat Mimosa 7m. 55s. elapsed time, 2m. 6s. corrected time. Alert beat Bobtail, scratch, 14m. 13s.

Lakewood Y. C.

Lakewood, Lake Erie—Sunday, June 26.

The Lakewood Y. C. held the second race of the series on June 26. It was sailed over the club's regular course, which is a triangular one of 3 miles to the leg. The weather was ideal, with a fresh breeze from the N. W., blowing from 15 to 16 miles an hour. There was a short chop of a sea, but the wind held and the race was one of the prettiest ever sailed by the club.

In Class A, there were only two starters, Echota not being in commission, Rooster II. and Chloris being the contestants. The latter got away first through Rooster's anxiety to gain too much on the start by going over the line about 40s. ahead of the gun, when she had to return and recross. On the first leg, which was a windward one, it was nip-and-tuck between the two, but on the second leg, a broad reach, Chloris literally ran away from her smaller opponent and gained 4m. when she reached the second turn. On the run home she again increased her lead, finishing 6m. and 19s. ahead of Rooster.

Class B made a pretty race, and Suzanne, formerly of Boston, was the surprise of the day, finishing only 25s. after Orinda, a 30-footer. Class C got away in a bunch, only 35s. separating the first from the last. Following is the summary:

	Class A—Start, 9:40.	Finish.
Chloris	10 51 06	
Rooster II.	10 57 26	
	Class B—Start, 9:45.	
Orinda	11 06 05	
Suzanne	11 06 30	
Mona	11 13 53	
Ceylox	11 22 22	
Vinco	11 29 05	
Unique	11 46 41	
	Class C—Start, 9:50.	
Truant	11 24 25	
Daphne	11 28 55	
Myth	11 54 36	
Nadie	Did not finish.	
Wa Wa	Did not finish.	

C. W. SCHMIDT, JR.

American Y. C.

Milton Point, Long Island Sound—Friday, July 1.

The annual regatta of the American Y. C. was sailed on Friday, July 1, off Milton Point. There were nineteen starters, and all but one finished.

The starting line was off Scotch Caps buoy, the first mark was the buoy off Execution Light, thence to the Red Springs buoy and back to the starting line, a distance of 9½ miles. The 60-footers covered this course three times. Class M boats went over the triangle twice, while the balance of the starters went around once. A fresh S. S. W. breeze made the racing lively and close. The sixties were sent away at 12:40. The first leg was a beat. Weetamoe crossed in the weather berth, Neola was just astern, but a little to leeward. Neola was never able to get from under her opponent's lee, and Weetamoe finished a winner by 47s.

The old rivals, Spasm and Anoatok, were the only starters in Class M. Spasm got the best of the start, and at the end of the first round had a substantial lead. On the second round Anoatok was hindered by a tow, and the delay cost her considerable time. Even without this interference Spasm would have won.

As usual the best racing of the day was seen in the raceabout class, there were six starters. The Kid led over the starting line, but she was the fourth boat to finish. Tartan, ex-Lanal, won and Cricket was second.

Adelaide won in the Larchmont one-design class and Hourly was a good second. Gazabo won in Class R, as Scoot, her only competitor, did not finish. Wa Wa beat Kenoshi over a minute in the Indian Harbor one-design class.

The regatta committee was composed of N. De B. Parsons, Howard Willets, J. Howard Wainwright, J. R. Steers and Stuyvesant Wainwright. The summary follows:

	Sloops—60ft. Class—Start, 12:40—Course, 28½ Miles.	Finish.	Elapsed.
Weetamoe, H. F. Lippitt.....	4 30 46	3 50 46	
Neola, Geo. M. Pyncheon.....	4 31 33	3 51 33	
	Sloops—Class M—Start, 12:50—Course, 19 Miles.		
Anoatok, W. G. Brokaw.....	4 08 51	3 18 51	
Spasm, E. D. King.....	3 59 24	3 09 24	
	Raceabout Class—Start, 12:55—Course, 9½ Miles.		
Cricket, Howard Willets.....	2 37 18	1 42 18	
Rascal II., S. C. Hopkins.....	2 40 33	1 45 33	
Tartan, A. H. Pirie.....	2 36 42	1 41 42	
Hobo, Trenor L. Park.....	2 38 09	1 43 09	
Maryola, C. W. Allen.....	2 41 13	1 46 13	
The Kid, Oliver Harriman.....	2 38 40	1 43 40	
	Larchmont—21ft. Class—Start, 1:00—Course, 9½ Miles.		
Adelaide, J. J. Dwyer.....	3 09 06	2 09 06	
Dorothy, L. G. Spence.....	3 10 28	2 10 28	
Hourly, J. H. Esser.....	3 09 44	2 09 44	
Vaquero, J. M. Marble.....	3 11 00	2 11 00	

	Sloops—Class R—18 to 21ft. Racing Length—Start, 1:00—Course, 9½ Miles.		
Scoot, Morgan Cowperthwait.....	Did not finish.		
Gazabo, H. T. Vulte.....	3 09 32	2 09 32	
	Indian Harbor One-Design Class—Start, 1:00—Course, 9½ Miles.		
Kenoshi, C. F. Mallory.....	3 11 56	2 11 56	
Anawanda, Edwin C. Ray.....	3 13 18	2 13 18	
Wa Wa, J. E. Montells.....	3 10 49	2 10 49	

Saturday, July 2—Power Boat Races.

Saturday was anything but an ideal day for power boat racing, as the wind was heavy and the water rough. The day was not only marred by poor weather, but by a bad collision as well. The accident happened some time before the start. Vingt et Un and Water Lily were speeding around the starting line. Mr. C. M. Hamilton, who was steering Vingt et Un, did not see Water Lily until it was too late to avoid a collision, power was shut off and the motor reversed, but she punched a hole in her hull just forward of the motor. Vingt et Un's stern was also injured. Water Lily did not sink and was towed to the Milton Point Shinyard, where she will be repaired. Vingt et Un limped back to Larchmont.

Hard Boiled Egg, Mr. W. K. Vanderbilt, Jr.'s boat, was caught broadside by the heavy wind, and to prevent being swept on Scotch Caps it was necessary to anchor.

The endurance race, scheduled to start at 10 A. M., was abandoned. In the afternoon there were four starters and only one class filled. The regatta committee decided to send the boats over a shorter course. The starting line was off Scotch Caps buoy, thence to and around Execution and back.

At 3:40 Suits Moi and Queen Bess, the two starters in Class C, were sent away. These boats actually covered the 7.2 knot course twice. Both are cabin boats. Queen Bess measures 34.65, and Suits Moi 33.30. Queen Bess allows Suits Moi 4m. 3s. At the finish Queen Bess led by 2m. 21s., so Suits Moi wins on corrected time by 1m. 42s.

Queen started in Class H, but had to give up after going part way over the course, as she had shipped a lot of water. In Class S, Dolphin II. was the only starter, but her steering gear gave out and she withdrew. The summary:

	Class C—Start, 3:40—Course, 14.4 Knots.	Finish.	Elapsed.	Corrected.
Suits Moi, G. M. Plympton.....	5 22 25	1 42 25	1 38 22	
Queen Bess, R. H. Stearns.....	5 20 04	1 40 04	1 40 04	

Class H—Start, 3:35.

Queen, J. J. Amory..... Did not finish.

Class S—Start, 3:35

leading to the outer mark, when Mblem got caught in stays on rounding the buoy, hanging there until Elizabeth secured a strong lead. Scott carried away a stay, which compelled her withdrawal, and Clara, the fifth contestant, was hopelessly outclassed.

The wind was W. to N.W., and one of the worst that local yachtsmen have had to contend with in a race in a long time. The boats were all under double reefs, and had all they could stagger under then at times, the afternoon being very squally. The percentage system of the Massachusetts Y. R. A. is used in scoring these races, the winner in each event being credited with 100, the second with 50, the third with 25 and all others that finish with 15, the final result being divided by the number of races. The other two races of the series will be sailed July 4 and 9. The summary, start 2:25, course 12 miles:

	Finish.	Elapsed.
Elizabeth, W. D. Wood.....	4 56 55	2 32 55
Mblem, G. E. Darling.....	5 06 22	2 41 22
Wanderer III., H. J. and D. W. Flint.....	6 17 00	3 52 00
Scatt, H. B. Scattergood.....	Disabled.	
Clara, W. Bennis.....	Did not finish.	

F. H. YOUNG.

New Rochelle Y. C.

New Rochelle, Long Island Sound—Saturday, July 2.

The nineteenth annual regatta of the New Rochelle Y. C. was sailed on Saturday, July 2. The thirty-one boats that started in this event were furnished with the liveliest racing imaginable. The 60-footer Neola lost her mast on the windward leg, and it was only by great good luck that some of those on board were not badly hurt or killed. A few weeks ago an English racing cutter, Caprice by name, a boat of about Neola's size, lost her mast through a defective turnbuckle and her mate was drowned. Neola's case was different from Caprice's, in that it was not due to faulty or weak rigging. The mast buckled under the terrific strain and broke off some ten feet above the deck.

The race was sailed in a hard N. W. breeze. The sixties covered a 27 mile course. The start was off Echo Bay, thence to the busy off Lloyds Neck and return. Neola and Weetamoe were started at 12:05, the former led over the line, but the latter was close behind. Weetamoe had her spinnaker drawing first. They carried working topsails, but for the beat home they doused them. Weetamoe had improved her position and was in the weather berth when Neola lost her mast. Both boats were on the starboard tack off Milton Point, and they were heeled down so far the lee rails were hidden to view. Neola's mast went in a particularly hard puff. Weetamoe promptly went to Neola's assistance and, on finding that no one was hurt, finished the race. Neola is sort of a "hoodoo" and has had more than her share of ill luck since she came out.

The breeze was too much for Anotok, and Spasm gave her a very proper beating. This makes two straight wins for Spasm, something she has not done in a long time. Alert was the only starter in Class M, and she went over the course alone.

Mr. Harry Maxwell's new raceabout Tom Boy sailed her maiden race. She was designed by Messrs. Tams, Lemoine & Crane and is an improved Lanai. She is very long over all, measuring 37ft. The boat was not in racing condition and she did not finish. Tartan won handily in the raceabout class, Rascal II., the New Crownshield production, was second.

Ojibway was the only starter in the 25ft. sloop class and she did not finish. Vaquero won in the Larchmont one-design class, but she was protested by Hourri for sailing the wrong course. In class T, Jeebi beat Skip easily. Gazabo did not finish. Scoot was beaten by Plover in the 18ft. sloop class.

There were four starters in the Indian Harbor one-design class. Wa Wa beat Shoshone, the second boat, nearly 9m. Scud was the only boat to finish in the Hempstead Harbor one-design class.

Close racing was seen between the three Manhasset Bay one-design boats. Bab beat Chicadee 58s. and Arizona 1m. The summary:

Sloops—60ft. Class—Start, 12:05—Course 27 Miles.		
	Finish.	Elapsed.
Weetamoe, H. F. Lippitt.....	3 15 45	3 10 45
Neola, George M. Pynchon.....	Dismasted.	
Sloop—36ft. Class—Start, 12:10—Course 17½ Miles.		
Spasm, E. D. King.....	2 45 24	2 35 24
Anotok, W. G. Brokaw.....	2 58 09	2 48 09
Sloops—30ft. Class—Start, 12:15—Course, 17½ Miles.		
Alert, J. W. Alker.....	2 58 20	2 40 20
Raceabout Class—Start, 12:20—Course, 17½ Miles.		
Tartan, A. H. Pirie.....	3 09 14	2 39 14
Rogue, A. B. Alley.....	3 22 30	3 02 30
Rascal II., S. C. Hopkins.....	3 15 55	2 55 55
Grasshopper, H. C. Fryer.....	3 26 04	3 06 04
Cricketer, H. Willets.....	3 17 28	2 57 28
Hobo, T. L. Park.....	3 23 16	3 03 16
Tom Boy, H. L. Maxwell.....	Did not finish.	
Sloops—25ft. Class—Start, 12:25—Course, 17½ Miles.		
Ojibway, D. P. Morse.....	Did not finish.	
Larchmont 21ft. Class—Start, 12:25—Course 17½ Miles.		
Dorothy, L. G. Spence.....	Did not finish.	
Hourri, J. H. Esser.....	3 45 50	3 20 50
Adelaide, J. J. Dwyer.....	3 49 48	3 24 48
Vaquero, J. M. Marble.....	3 44 52	3 19 52
Sloops—Class T (21ft.)—Start, 12:30—Course, 8½ Miles.		
Gazabo, H. T. Vulte.....	Did not finish.	
Jeebi, A. D. R. Brown.....	2 03 44	1 33 44
Skip.....	2 08 52	1 38 52
Sloops—18ft. Class—Start, 12:35—Course, 8½ Miles.		
Plover, H. Place.....	2 01 17	1 26 17
Scoot, M. Cowperthwait.....	2 09 45	1 34 45
Indian Harbor One-Design Class—Start, 12:40—Course 8½ Miles.		
Kenoshi, C. D. Mallory.....	2 13 23	1 33 23
Anawanda, E. C. Ray.....	2 07 18	1 27 18
Wa Wa, J. Montells.....	1 57 14	1 17 14
Shoshone, George F. Dominick.....	2 06 08	1 26 08
Hempstead Harbor One-Design Class—Start, 12:45—Course 8½ Miles.		
Scud, D. Abbott.....	2 23 07	1 38 07
Why Not, W. Murdock.....	Did not finish.	
Manhasset Bay One-Design Class—Start, 12:35—Course, 8½ Miles.		
Bab, J. R. Hoyt.....	2 12 10	1 37 10
Arizona, G. M. Corry.....	2 13 10	1 38 10
Chicadee, J. P. Mohr.....	2 13 08	1 38 08

Vingt et Un—F. I. A. T. III. Match Races.

Larchmont, Long Island Sound.

First Race, Monday, June 27.

The first race between Vingt et Un and F. I. A. T. III. for the two thousand dollar gold cup was held on Monday, June 27. The trophy was subscribed for by Messrs. Smith & Mabley and Hollander & Tangeman, each firm putting up one thousand dollars. The cup, a production of Tiffany & Co., is of 18 karat gold, weighing 1,132 pennyweights. With the green onyx base it stands 20 inches high. The particulars of the two boats follow:

	L. W. L.	H. P.	Rating.
Vingt et Un, Smith & Mabley.....	39ft. 9in.	59.70	84.
F. I. A. T. III., Hollander & Tangeman.....	38ft. 4½in.	66.25	85.6

F. I. A. T. allows Vingt et Un ¾s. per mile, or 1m. 39s. over a 30-mile course.

Each of the firms interested in the event had boats built for the matches, and the races were run under the auspices of the Larchmont Y. C. The regatta committee were on board the tug Unique. A 15 mile triangular course was settled upon. After four hours of delay the boats were started at 2:30. As it turned out, neither one of the contestants had enough gasoline in their tanks to cover the course. Whether this was an oversight or purposely done with the idea of saving weight is not known. Whatever the reason was it resulted in making the race a farce. F. I. A. T. III. was first over the line, 1½s. after the signal, Vingt et Un crossed 30s. later. Vingt et Un closed up on her rival soon after the start and passed her before reaching the first mark, which was three miles from the starting line. F. I. A. T. III.'s gasoline gave out at the first mark, and she was out of the race. Mr. Claire Hamilton, who was in charge of the Vingt et Un, slowed his boat down when F. I. A. T. III. dropped out and jogged his boat over the balance of the course. Vingt et Un finished the first round at 3:39:07, having consumed 1h. 4m. 7s. in making the first 15 miles. The second round she made in even slower time, 1h. 58m. 40s. When Vingt et Un was within a few yards of the finishing line her gasoline gave out and the engine stopped, her headway, however, was sufficient to carry her across the line. The times were:

	Start.	1st Round	2d Round.
Vingt et Un.....	2 35 30	3 39 07	4 33 40
F. I. A. T. III.....	2 35 11	Did not finish.	

Second Race, Tuesday, June 28.

The second race between Vingt et Un and F. I. A. T. III. was held on Tuesday, June 28. A stormy E. breeze that made the water rough necessitated delaying the start until 5 P. M. By this time the wind had dropped considerably, and the water was smoother.

Vingt et Un beat F. I. A. T. III. 20m. 54s. elapsed time and 22m. 33s. corrected time. The course was 15 miles straight away and return. Vingt et Un pulled into the lead directly after the start and was never headed. The summary follows:

	Start.	Finish	Elapsed.
Vingt et Un.....	5 00 19	6 32 50	1 32 31
F. I. A. T. III.....	5 00 05	6 53 44	1 53 39

Vingt et Un averaged 19.46 knots, or 22.40 statute miles an hour, which is really remarkable going for a 75 horse-power boat of less than 40ft. length. The \$2,000 trophy goes to Vingt et Un.

Vingt et Un and her sister boat, which is equipped with a 150 Smith & Mabley engine, will be shipped to England at once. They will compete in the races for the Harmsworth cup, held on the Solent this month.

Brooklyn Y. C. Ocean Race.

Gravesend Bay, L. I., to Marblehead, Mass.

Start, Saturday, July 2.

Of the eighteen boats entered in the Brooklyn Y. C. ocean race, nine actually started. This was an excellent showing, and the promoters of the race are to be congratulated. They were indeed fortunate to get together so many boats whose owners were willing to undertake so long and strenuous a trip.

The race was suggested by Mr. Thomas Fleming Day, editor of our contemporary The Rudder. The details of the race were, however, arranged for by the Brooklyn Y. C., under whose auspices the contest is sailed. The first prize is an 100 guinea cup offered by Sir Thomas Lipton. Other substantial prizes will be awarded.

Nearly all the starters were in the harbor the night before the race, and the owners and crews of the respective boats assembled at the club house during the evening. All hands were most enthusiastic, and it would be difficult to find the world over a finer and more representative lot of amateur yachtsmen.

The race was open to boats of any rig of not more than 40ft. over all length. The time allowance was figured on over all length. Forty minutes to the foot was the amount finally decided upon. Newasi is the largest of the fleet and is the scratch boat. Sea Bird is the smallest and gets time from all the other craft. The following is a list of the starters:

	L.O.A.	H.M.
Newasi, sloop, A. H. W. Johnson, Larchmont, P.....	38.9	
Mignon, sloop, Dr. J. Fournier, Indian Harbor, W.....	36.25	1.46
Sea Bird, yawl, T. F. Day, Springfield, S.....	25.6	8.52
Eumareia, sloop, E. K. Hill, Rhode Island, L.....	36.25	1.46
Mopsa, sloop, F. C. & W. S. Sullivan, Harlem, M.....	35.15	2.30
Fanshawe, yawl, F. Maier, New Rochelle, V.....	36.3	1.44
Little Rhody, sloop, C. F. Tillinghast, R. I., X.....	34.66	2.49
Ray II., sloop, G. R. Hawes, Brooklyn, Z.....	37.25	.46
Siren, sloop, C. F. Wigand, Staten Island, A.....	38.	.36

The Rhode Island Y. C. is the only club represented by two boats. This speaks well for that organization. The crews of the different boats follow:

Newasi, A. H. W. Johnson owner, Charles D. Mower, Charles L. Perrin, Captain T. Chase and Tom Hansen, paid hand.

Siren, C. F. Wigand owner, F. D. Cadmus, P. B. Worthington, W. F. Bale and Hans Buthe, paid hand.

Ray II., G. R. Hawes owner, John W. Dunlap, George W. Robinson, Jack Robinson and H. Peterson, paid hand.

Fanshawe, F. Maier owner, L. D. Huntington, William Mills, Robert Bavier, Warren Shepard and John O. Johnson, paid hand.

Eumareia, E. K. Hill owner, Dwight B. Hill, Sumner Edwards, George Kinghead, Harold Freeman and H. Burr, paid hand.

Mignon, Dr. L. Fournier owner, Dr. J. S. Fulton, Dr. Van Saun, A. M. Duncan and F. C. Sypher, paid hand.

Mopsa, F. C. and W. S. Sullivan owners, John Wimmers, Dr. T. A. Martin, Ed. J. Martin.

Little Rhody, C. F. Tillinghast owner, George Owens, James H. Thurstan, Irving O. Hunt, S. Foster Hunt and George A. Fuller.

Sea Bird, T. F. Day owner, T. Bieling and L. Kent.

Saturday proved to be an ideal day for the start of the race. It was clear as a bell and a fresh N. W. breeze was blowing.

The regatta committee, composed of D. G. Whitlock, James A. Donnelly and Charles E. Allen, were on board Commodore Fontaine's flagship Sunshine. The starting line was directly off the club house.

The warning signal was given at 10:45, and ten minutes later the preparatory was heard. At 11 o'clock the boats were started.

"Larry" Huntington, at the wheel on the wholesome yawl Fanshawe, placed his boat nicely and she crossed first, a few seconds after the gun. Sea Bird was next, then came Little Rhody, Mopsa, Siren, Ray II. and Eumareia. Newasi was late in crossing, as was Mignon, which boat crossed 5m. after the gun. All the boats were well below their lines, as they were loaded down with extra gear and stores. The boats crossed on the starboard tack, all carrying full sail. Short tacks were made, and they worked around Norton's Point when sheets were eased and the eastward courses were laid.

When the boats passed Fire Island Light Little Rhody was leading, Sea Bird was second and Mopsa third. The other six boats were well bunched.

As we go to press, word is received from our Marblehead correspondent that Little Rhody finished at 9:48 Monday night. She took 58h. 48m. to cover the 330 miles. Newasi was the second boat to finish. She was timed at 12:40 Tuesday morning. She was 2h. 52m. behind Little Rhody. Ray II. was third.

Bayside Y. C.

Bayside, Long Island Sound—Saturday, July 2.

Over 200 members and guests of the Bayside Y. C. were on hand at the opening of the organization's new club house, on Saturday, July 2. The flag was hoisted by Commodore G. Waldo Smith at 3 o'clock.

At half past four the one-design dories sailed a race for the Dedication cup, a silver trophy presented by Mrs. Harry T. Weeks. The boats covered a 3½ mile windward and leeward course. The wind was N. W., and it blew hard throughout the race, so hard, in fact, that most of the starters had a nasty time of it. Bug and Fly took in so much water that their owners beached them. Bunnie won by 1m. 30s. The summary:

One-Design Dories—Start, 4:30.		
	Finish	Elapsed.
Bunnie, Leo Bugg.....	5 02 00	0 32 00
Mystery, J. H. Lee.....	5 03 30	0 33 30
No Name, C. J. Robert.....	5 05 10	0 35 10
Fore, James Cullin.....	5 06 55	0 36 55
Chip, C. T. Jackson.....	5 08 00	0 38 00
Peg Wee, J. P. Paretti.....	5 10 00	0 40 00
Bug, J. C. Hill.....	Withdrew.	
Fly, W. C. Van Antwerp.....	Withdrew.	

Morrisania Y. C.

College Point, L. I. Sound—Sunday, June 26.

THE contestants in Class B of the Morrisania Y. C., which were unable to finish on regatta day, resailed the race on Sunday, June 26. The boats were sent across the line at 11:55, running free, the wind being on the port quarter. Haydee got the lead by about two lengths, followed by Pinochle; Clytie bringing up the rear. They headed for Rikers Island, off of which they gybed and straightened their course for College Point. At a point between Hunt's and College Point buoy, the boats again changed their course, and headed for Fort Schuyler, then to Stepping Stone Lighthouse, Clytie in the meantime having gained the lead.

Gybing around the lighthouse, Pinochle carried away her spinnaker boom. Haydee at this time was far astern. When off Point View the boats encountered a heavy squall. They carried full sail, however, and the heavy blow just suiting Pinochle, she forged ahead of the Clytie, and crossed the line a winner. The summaries:

	Start, 11:55.	Finish.	Elapsed.	Corrected.
Pinochle.....	2 59 00	3 04 00	3 04 00	
Clytie.....	3 01 15	3 06 15	3 04 06	
Haydee.....	3 31 30	3 36 30	3 34 10	

Pinochle won by 6s.

Rhode Island Letter.

PROVIDENCE, R. I., July 2.—A special club regatta and "ladies' day" celebration has been announced by the Edgewood Y. C. for next Saturday, July 9, with an afternoon band concert and an evening hop at the club house. The regatta will include four classes for cats and two for launches, that of the 30ft. cats being the final race in the Possner cup series. The Edgewood Y. C. membership went above the 600 mark last week.

Sybarita, owned by Mr. W. Gould Brokaw, of New York, arrived at Newport this week from England, and has attracted much attention from yachtsmen as she lay at anchor in the harbor. She has a picked crew of English racing sailors, who are busy overhauling the vessel, and she will shortly leave for City Island to be made ready for racing. Sybarita was built for the late Whitaker Wright.

A racing sloop 30ft. on the waterline was built at the Herreshoff shops in Bristol several months ago for Mr. C. S. Eaton, a well-known Boston yachtsman. She was constructed on the moulds of Onward, owned by designer Chesbrough until last season. Desiring a larger boat, Mr. Eaton had the Cock Robin, a 39ft. waterline boat, built by the Herreshoffs, who took the 30-footer in trade. The latter has now been purchased by Mr. T. L. Park, of New York, who has named her Mimosa III. She is 47ft. over all, 30ft. waterline and 7ft. 6in. beam.

Mr. Harold Vanderbilt's cruising and racing sloop Trivia is being fitted out in readiness for a cruise when her owner returns from Europe, about Aug. 1. Trivia will go into commission at Bristol.

The event of the week at Bristol was the departure of the 22ft. sloop Little Rhody for New York Monday evening, to enter in the Brooklyn Y. C. ocean race to Marblehead, Mass. Her owner, Charles F. Tillinghast, is vice-commodore of the Bristol Y. C., and the members of the club gave him an elaborate send-off, presenting to him a club pennant to bring good luck in the race.

The Herreshoffs are building a 50ft. steam launch, which is nearly completed and which will have a speed of about 24 miles an hour.

Mr. H. D. Salisbury has just completed, at his Riverside shop, a neat little cabin launch for his brother, Mr. Irving A. Salisbury, of Providence. The launch is named Starling, and is 27ft. over all, 23ft. waterline and 9ft. beam, with an 8 horse-power Meade engine. She is finished throughout in oak, and has a 12ft. cabin, with full standing room and fitted with extension berths.

The Washington Park Boating Association has announced four more club regattas for the season, the dates being July 9, Aug. 6 and 20, and Sept. 5. In addition to these there will be a series of three special races for the 30ft. cats for the cup offered by Commodore Peirce.

F. H. YOUNG.

British Letter.

The accident which happened to one of the South Coast one-design boats a short while since while racing, whereby she lost her mast and her mate was knocked overboard and drowned, has once more raised the question as to the efficacy or desirability of rigging screws for setting up the rigging. It will be remembered that Shamrock III. lost her mast—and one of her crew—at Weymouth last year through a similar cause, and it is said by many people who are qualified to judge that rigging screws are not trustworthy unless they are of such a size as to make them exceedingly clumsy. Of course, nothing is so neat or shipshape looking as well finished gunmetal screws, and probably if sufficient care were taken to insure that the strain on them is evenly distributed, there would be far fewer accidents. Their chief danger lies in their simplicity and the ease with which they can be tightened with just a few turns. It is so easy to turn one more than its fellow, and thus practically throw the whole strain on one shroud. The wire rope may stand, but the screw will not—hence disaster. However, as screws are so light and neat, they will probably continue in vogue in spite of accidents, and the difficulty might be got over by making them of copper, phosphor bronze, or some such metal, the tensile strength of which is infinitely greater than that of gunmetal or steel. A very good plan for people who study efficiency more than looks, is to use instead of screws lanyards made of small, flexible steel wire rope. They can be rove very neatly, though not with such a finish as screw lanyards, but they are absolutely dependable. The only objection is that they hold more water if they get submerged.

The New Thames Y. C. stuck to their old course this year from Gravesend to the Mouse Lightship and back, the reason being presumably because their club house is at Gravesend, and it enables those of the members who do not go afloat to see, at any rate, the finish, besides being more convenient for those members who patronized the club steamer. It is a pity the club does not waive such considerations, in view of the fact that the course off Southend is a far better one, and that the traffic in the Thames in the neighborhood of Gravesend Beach becomes more congested every year. There is only one thing to be said in favor of the old course, and that is it enables the yachts to lie snug in Tulbury Docks. The course itself, however, is fluky and unsatisfactory, and should be discontinued.

There was a good entry for the time-honored races from the Nore to Dover of the Royal Thames Y. C. on June 11, and fast passages were made. With a leading wind over most of the course, the scratch boats—Bona and Tutty—in the handicap classes did not get a prize. The 52-footer quartette sailed an extremely close race, only 1m. 32s. separating them at the finish. The new boat Maymore was the winner. There will be an addition to the 52ft. class soon, for Mr. Paget is having alterations made to Viola. She has had a hollow mast fitted, her sail area reduced, and lead added to her keel. These alterations may, and will, no doubt, improve her, but it is doubtful if she will ever be able to do anything with the others.

E. H. KELLY.

Interlake Yachting Letter.

CLEVELAND, O., June 30.—The 21ft. class of Detroit leads all others this summer. The last of the five restricted boats was received last week. She was designed by Mr. Chas. L. Seabury, and has the earmarks of a comer. She is owned by Messrs. J. H. Smedley, Jr., and Northam Warren. She has been named Ventura. Mr. Cothrell, official measurer of the Columbia Y. C., of Chicago, who was called upon to measure the boat, says of her: "She is the boatiest boat of the lot." He further states her to be the most wholesome, without any attempt being made to infringe on the rules or the spirit thereof.

In the very first trial she looked up well, footed fast, reached splendidly, and ran well. She compared very favorably with the rest of the fleet, and it is safe to assume that when thoroughly tuned up will hold her own with any of the other boats in the class.

The new class is having considerable trouble, according to Measurer Cothrell, of Chicago, in that not one boat of the entire lot will meet the restrictions placed upon the class. Eyota, a Burgess & Packard design, with a bunch of reverse curves, etc., has settled so much that it is a grave question whether she will ever be allowed to participate in any of the races. The limit of the waterline is 21ft., and Eyota runs considerably over that now, while the probabilities are that she will approach 22ft. before she has finished. Another of the class is so long on the waterline that her builders have decided to substitute an aluminum centerboard and rudder in place of the iron one she originally carried. About a foot of her deadwood will have to be cut away, and then it is a question if she can make the class.

Another is two inches too long on deck, and so on through the fleet. The Seabury boat comes nearest approaching the class for which she was built. However, enthusiasm is rife, and most of the yachting interest of the Inter-Lake Association is centered in this class. Several preliminary races have been sailed, but to date Pirate, a Detroit creation, seems to have had the best of the argument. She was designed and built at Wyandotte, a suburb of Detroit, by Mr. Joe Pulliott, and is practically a copy of the Little Shamrock, a Small Bros. production. She went to Detroit from Chicago and won the cup hands down. Mr. E. L. Ford admired the type and style, and immediately contracted with Pulliott to build him a similar craft with some improvements. Her success so far justifies Mr. Ford's shrewdness and good judgment. In Chicago the interest seems to be lagging, and not a single boat has been built. One was built for Commodore Villas, of Milwaukee, which has been named Mendota. George R. Peare, owner of LaRita, twice-winner of the Lipton cup at Chicago, was refused a racing certificate on the grounds that LaRita was something over 2ft. too long on deck. The committee are very strict this season, and no new boats will be permitted to compete that do not meet all requirements governing the class. Not even can the spirit of the law be evaded. No new boats have been built for the class at Chicago this year, and there is some danger that some of the new boats may carry off the coveted trophy, which may explain, in a measure, the strict adherence to the rules. C. W. SCHMIDT, JR.

Erie Yacht Burned.

THE new yacht Tonkawa, Captain Bens, was destroyed by fire off Conneaut harbor, the first harbor west of Erie, on the night of the 30th of June. The Tonkawa and several of the larger yachts had started on a cruise up the lake, and while the boats were at anchor off Conneaut a tank of gasoline on the Tonkawa exploded, destroying the

boat. Captain Bens and his two guests, Wells and Widener, barely escaped with their lives, losing guns, clothing, and everything they had on the yacht.

They were lucky to have their tender towing astern at the time, and escaped in it.

The yacht was a new one built by the captain himself, and he feels his loss keenly. He valued the boat at \$1,000. CABIA BLANCO.

YACHTING NEWS NOTES.

For advertising relating to this department see pages ii and iii.

MORICHES Y. C. RACING DATES.—The Moriches Y. C. has announced the following schedule:

Club regatta, Saturday, July 9—Two classes, AA and A, open only to members; helmsman must be amateur club member.

Annual cruise Saturday, July 30—Special orders for this event will be issued later.

Ladies' race, Wednesday, August 10—In two classes, AA and A, open to all; "one man only may be in crew, but he shall not touch the helm."

Special members' race, Saturday, August 20—In two classes, AA and A; helmsman and crew must all be amateurs.

Association regatta, Saturday, August 27—Open to members of organized yacht clubs of Great South and Shinnecock Bays.

Open race for Moriches boats, Labor Day, Monday, September 5—In one class; open to amateurs in East and Center Moriches. Under a resolution of the club the Memory, Dodo, and Esther are debarred from entry, this race being especially for the general utility catboat of east bay waters.

The dates of the associated clubs are:

Shinnecock Y. C.—Monday, July 4, club race; Saturday, July 23, club race; Thursday, Friday, and Saturday, August 4, 5, and 6, three days.

Association regatta—Friday, August 19, ladies' race.

Westhampton Country Club—Saturday, July 16, club race; Saturday, August 13, association race; Friday, July 29, ladies' race; Friday, August 26, ladies' race; Saturday, September 3, open race.

AUXILIARY YAWL DAILY LAUNCHED.—A few days ago the auxiliary yawl Daily was launched from the yard of the builder, W. P. Kirk, Toms River, N. J. The boat was designed by Mr. Henry J. Gielow for Mr. Robert Galloway, of Memphis, Tenn. She is 80ft. over all, 65ft. waterline, 17ft. 6in. breadth, and 3ft. draft. Daily has a long rig with a long base, and very short mast. She is equipped with a Graig engine of 25 horse-power, which will drive her about 8 miles an hour.

YAWL SYBARITA REACHES NEWPORT.—Mr. W. Gould Brokaw's British yawl Sybarita arrived at Newport on June 29; she was twenty-five days out from Southampton. She proceeded to City Island to fit out, reaching there on July 1.

NEW JERSEY BAYS BETTER BUOYED.—The yacht clubs along the Jersey coast from Bay Head south have taken up the job of staking out the bays and inlets, thoroughfares and channels, where Uncle Sam is too parsimonious to do it for the watermen, and have already begun the work. The matter has been discussed year after year by the amateur yachtsmen, and more or less has been done, but the staking will be more extensive and complete this year than before.

From Bay Head south to the mouth of Toms River has already been staked by the Bay Head and Mantoloking Clubs. From the mouth of Toms River to Sloop Sedge the Island Heights and Sea Side Park Clubs are doing the work. From Sloop Sedge to the Bonnet draw William J. Thompson, who runs the Harvey Cedars Hotel, has arranged for the staking. Beach Haven Y. C. has staked out the channel as far south as the Cedars, at Little Egg Harbor Light.

From Little Egg Harbor inlet to the Main Marsh Thoroughfare is a strip that no one has taken up, but it is expected that the Atlantic Y. C. will stand responsible for it, and also that the Ventnor and Chelsea Clubs will arrange for the thoroughfares back of Absecom Beach. The Ocean City Club will care for the waters of Great Harbor, and the new Cape May Club is expected to do as well for its waters.—Philadelphia Record.

RAINBOW TO GO IN COMMISSION.—The 70-footer Rainbow will be put in commission by Mr. Cornelius Vanderbilt at once. The boat is now at New London, and work has already commenced.

CAPE MAY CUP ARRIVES.—The Cape May cup, which was returned by the Royal Yacht Squadron to the New York Y. C., arrived in New York a few days ago.

PALMETTO ON LONG CRUISE.—The cruising launch Palmetto, owned by Mr. T. I. Snider, of Cincinnati, arrived in Chicago a few days ago from New Orleans. After a stop at New Orleans the boat came on to Chicago by way of the Mississippi and Illinois rivers and the Illinois and Michigan Canal. Palmetto will continue her cruise down Lake Michigan, stopping at Milwaukee, Mackinaw Island and Sault Ste. Marie, thence down the lakes through the St. Lawrence River and back to New York.

AUGUSTIN MUNROE DEAD.—Augustin Munroe, an ex-commodore of the Larchmont Y. C., died at his home in Larchmont on Sunday, June 26. Mr. Munroe has been identified with yachting for the past twenty-five years. He became a member of the Larchmont Y. C. soon after it was organized. He was commodore in 1884-5, and since that time has been a trustee and chairman of the house committee. It was through his efforts and untiring devotion that the Larchmont Y. C. became the foremost racing club in this country, and the most prominent yachting or country organization on Long Island Sound. Mr. Munroe was a Mason of standing, and was a member of many clubs. The funeral took place on July 1, and the services were attended by a large number of yachtsmen and clubmen. The interment was at Woodlawn. He was forty-nine years old.

SCHOONER WAYWARD SOLD.—Colonel David E. Austen, of Brooklyn, has purchased the schooner Wayward from Mr. Frank W. Duryea.

SEAWANHAKA-CORINTHIAN Y. C. YEAR BOOK.—We have received a copy of the 1904 book of the Seawanhaka-Corinthian Y. C. It is handsomely bound in blue leather.

CORINTHIAN Y. C. YEAR BOOK.—We are indebted to Mr. Everett Paine, secretary of the Corinthian Y. C., for a copy of the club book for 1904.

A. C. A. National Meet, Sugar Island, Thousand Islands, St. Lawrence River, August 5-19, 1904.

Officers of A. C. A., 1904.

Commodore—C. F. Wolters, 14 Main St. E., Rochester, N. Y.
Secretary-Treasurer—John Sears Wright, 519 West Ave., Rochester, N. Y.

Executive Committee—C. E. Britton, Gananoque, Ont.; Harry Page, Toronto.
Board of Governors—J. N. MacKendrick, Galt, Ont.
Racing Board—E. J. Minet, 125 Vitre St., Montreal, Canada.

WESTERN DIVISION.

Vice-Commodore—Burton D. Munhall, care of Brooks Household Art Co., Cleveland, O.
Rear-Commodore—Chas. J. Stedman, National Lafayette Bank, Cincinnati, O.
Purser—Geo. A. Hall, care of Bank of Commerce, Cleveland, O.
Executive Committee—Thos. P. Eckert, 31 West Court St., Cincinnati, O.; Dr. H. L. Frost, 10 Howard St., Cleveland, O.
Board of Governors—Henry C. Morse, Peoria, Ill.

How to Join the A. C. A.

From Chapter I, Section 1, of the by-laws of the A. C. A.: "Application for membership shall be made to the Secretary, and shall be accompanied by the recommendation of an active member and by the sum of two dollars, one dollar as entrance fee and one dollar as dues for the current year, to be refunded in case of non-election of the applicant."

The Allegash Canoe Trip.

KNOWING no remedy for the fever that annually attacks a man just before the hunting season opens, other than a trip into the woods, a party of Boston sportsmen—H. E. Moore, H. B. Leighton, and G. H. Sperry—boarded the 9:45 train for Bangor, Me., on the evening of October 1, 1903, all in high spirits at the prospect of a canoe trip through the heart of Maine's best hunting region.

Arriving there the following morning, we procured a fair breakfast at the railroad station, and were soon on our way to Greenville. The foliage all through the Piscataquis Valley was grand; and standing on the car platform, inhaling the pure mountain air, one gets the first real taste of life in the woods.

Reaching Greenville at 2:30 A. M., we donned our hunting togs and sought our guides, who had supplies and provisions at the wharf in readiness for the steamer, which leaves for Kineo at 5 o'clock P. M. The guides were Algie Spearen, of Smyrna Mills; Will McKenny, of Patten, and Warden Cummings' son, Fred, of Houlton. The two first named have made the Allegash trip several times, and are thoroughly familiar with the entire country through which we passed, and experts with the paddle and pole. Cummings can cook as well as many pro-

professionals, and McKenny can build a bough bed that is as comfortable as a hair mattress. They are first-class men, and we take pleasure in recommending them to fellow sportsmen.

Moore carried a new .32 Winchester rifle, while Leighton and the writer were content to cling to their .30s—these rifles being heavy enough for any game that inhabits the Maine woods, and far superior to those of large caliber when weight and accuracy are considered.

We had three 18ft. canvas canoes, two light twilled duck wall tents, ten feet square, and each man carried a Phelps sleeping bag, sailor's bag also, in which were packed two pairs of heavy woolen socks, an extra set of woolen underwear, a sweater, and pair of moccasins, a small medicine case, well stocked; a small electric light, ammunition, cigars, pipes, and tobacco; brandy and whiskey (in case of illness), extra handkerchiefs, towels, and toilet articles, and a rubber army blanket and hot water bottle, both very necessary.

Our provisions consisted of flour, bacon, salt pork, lard, potatoes, onions, eggs, tea and coffee, sugar, salt, pepper, pickles, maple syrup, canned fruits, beans, baking powder, jelly, evaporated cream, candles, and matches. Also a gun cleaner and gun grease.

Everything being in readiness for our trip, we got dinner, then trailed around the town until time to board the steamer. The scenery on the lake was magnificent; the moon, bright and clear, lighted everything around us, and old Moosehead never looked more attractive. We reached Kineo at 7:30 P. M., and after supper took a stroll through the woods. Soon we heard a deer blow just ahead of us. We returned to the hotel at 10 o'clock, and after a smoke and a story from Leighton (both indispensable), retired for the night.

The morning of the third we boarded the steamer which left for the head of the lake at 8 o'clock, reaching Northeast Carry at 10. The weather was perfect; the air clear and crisp, and the foliage beautiful in its autumnal coloring. Our guides loaded our supplies upon a team which is kept here through the hunting season, and before noon we were ready to start down the West Branch waters. The Northeast Carry is two miles, for which there is a charge of one dollar for each canoe, including all luggage.

We lunched at Allen's house on the carry, then continued on, reaching Joe Smith's half-way house at 5 P. M. (where we stopped for the night), just eleven miles from where we put in canoes.

While waiting for supper, we sauntered out for a little prospecting, and had not gone one-half mile when we saw three deer. Returning at dusk, we partook of a fair meal, and retired early. The next morning, after settling with Smith (whose charge is \$1.50 for each man), we started for another day's trip. We passed a crew of lumbermen going down river with supplies; they were singing and apparently contented with their lot in life. But for them we would have been unable to continue our journey, as the river was the lowest it had been for years, rendering it impassable except for the channel they had dug for their bateaus.

At Pine Stream Falls it was very rocky, the drop from top to bottom being sixty feet in the half mile; but we got through without injuring our canoes, after which came dead water and good paddling to Chesuncook Lake, three miles away.

We passed five camping parties going down the West Branch, all having deer hanging in front of their camps.

Obtaining additional supplies at a store on the shore of Chesuncook, we started for Umbagog Stream. The wind blew a gale, the lake, being eighteen miles long, piled the breakers pretty high, but we got through all right, pulled our canoes on shore, and emptied the water they had shipped, then kept on through the meadows, a distance of six long, hard miles, but a splendid game country. While going through the latter place we saw a moose and two deer; also quantities of ducks. Our luggage being loaded upon a team, we started ahead, reaching Frank Smith's camps on the shore of Umbagog Lake, three miles distant, at 5:30 P. M. These camps are ideally located in the heart of the hunting country; everything is neat and comfortable as possible, and we were quite content to rest here over night. Soon after our arrival we saw a cow moose and calf in the water, about twenty feet from shore, and while eating supper a deer stalked past the window; and later, while strolling about the clearing, we saw six more deer in the potato-patch. The following morning at 5 o'clock, as we were leaving our tent, two deer jumped out not ten feet away, proving this to be quite a game region.

After a first-class breakfast, we settled Smith's bill, the charge being \$5 for each man's canoe and luggage, and \$1.50 apiece for board and lodging, then started ahead of team for Mud Pond, two miles away. We had but just left the yard, where two bucks jumped behind one of the camps. We were loth to leave this pleasant spot, so neat, inviting, and convenient to sportsmen, but our time was limited, so we jogged along, and on reaching our destination were greeted with the picture of a doe and her fawn feeding along the shore.

This pond is one and a half miles long, and one mile wide; it is well named, mud being a foot under water from one end to the other. The country, however, looks very promising for game. Upon the arrival of the team, we loaded our canoes and started for the opposite shore, where there is another two-mile carry; here everything has to be sacked, there being no team on this side.

We reached Chamberlain Lake at 11 A. M., and lunched on shore in a pouring rain; but soon after the sun was shining brightly, and we started in a fair wind for the dam at the foot of the lake, six miles away, reaching there at 1:30. The gates at the dam were opened, thus affording us plenty of water below the falls.

After carrying around the dam and quick water (twenty rods), we were soon on our way to Eagle Lake, two miles distant, reaching there at 3 o'clock. This lake is fourteen miles long and five across; is surrounded by ridges, and a great game country, and said to be the most picturesque of any in the State. At the head of the lake we saw a big bull moose wallowing around in the water, and after looking us over, he leisurely stalked off into the woods. It is a ten-mile paddle through the narrows to the foot, but the water was like a mirror, so we decided to make the distance before dark. After paddling about six miles, without the slightest warning the wind

suddenly arose and blew half a gale, showing how treacherous these lakes are at times. As we came into Eagle Lake, in the distance were seen Pleasant and Picket Mountains, under which are Harrow and Pleasant lakes, about five miles back of Churchill.

The waves dashed high over our canoes, but we worked like Trojans, and reached the narrows at dusk, and prepared for our first night in the open air. The guides pitched our tents in a little grove, and building a roaring fire, soon after had supper ready, which we heartily enjoyed, for we were hungry as wolves.

It was another beautiful moonlight night; so after a smoke, we jumped into a canoe and paddled along the shore for a mile, and heard a deer snort and blow as we passed. After enjoying the scenery for awhile, we returned to camp, and were soon in our sleeping bags.

We were out early the following morning of the sixth, and continued through Eagle Lake thoroughfare, two miles, to Churchill Lake. We saw two deer going through the deadwater. Keeping along the shore for two miles, we found a camp ground used by fishermen in the summer with tables, seats, and a fire-place, all in condition for immediate use; so we pitched our tents and decided to spend a day or two in this famous hunting country. Everything in shape and lunch over, each man, with his guide, shouldered his rifle and started for a hunt. Leighton saw the largest moose his guide had ever run across, with antlers spreading over five feet, another smaller one, and two deer, but failed to get a shot. Moore saw two deer, and heard a moose crashing through the woods a short distance away, but refused to be tempted. The writer saw two deer and shot a buck. Pretty good luck for three hours' hunting!

After supper we strolled along the shore for a while. The hunters' moon was again doing herself proud, and the night was beautiful. A cow moose called on the opposite shore, and kept it up well into the night.

We started the next morning of the seventh for another hunt; the weather was clear and warm as a June day; trout and togue were jumping from the water in all directions, some of which were very large.

We went up Pleasant Stream, but saw no game. It was cold, and the water had frozen over, so we came down stream and took an old tote road into Spider Lake, three miles back from Churchill. It was the most picturesque old logging road I ever tramped over. No wood has been cut for fourteen years, and it was great for deer.

Spider Lake is situated right under a ridge of low mountains, and Arbo and Libby have a set of camps here. During the day we saw altogether ten deer, and Moore got within seventy-five yards of a bull moose crossing to meet a cow, who stood on the opposite shore. Having what meat we needed, we agreed to shoot nothing except it carried a good set of horns, for deer were seen everywhere.

At 4 o'clock, Leighton and the writer went down the shore for a mile or two; seeing a clearing in the thick woods that had been used by some camping party, we sat down and got out our maps to trace our morning trips, when suddenly there was a blow close by, and looking up we saw a big buck deer, not twenty-five yards away; but before we could reach our guns he was off. Deer are certainly very plentiful all through this section.

Returning to camp, we proceeded to fill up on venison, broiled partidges, canned fruits, and other luxuries, and never was a dinner at the Touraine eaten with keener relish and enjoyment. Seated around the camp-fire a little later, pulling listlessly at our pipes, listening to the inevitable stories—some very good, others too ancient to be interesting—we were, at an early hour, glad to crawl into our sleeping bags laid on beds of fir boughs, and wondered where else a man could go to better rid himself of all business cares, and enjoy complete rest.

"While the soul is free as the mountain air,
And the heart in the bosom leaps,
The stars keep watch through the silent night,
As the man at the camp-fire sleeps."

[TO BE CONTINUED.]

The Bishop Canoes.

THE late Nathaniel H. Bishop, one of the founders of the American Canoe Association, made several long and notable cruises in his day, some of which he reduced to writing and published. "The Voyage of the 'Paper Canoe,'" and "One Thousand Miles in a Sneak-box," are two of them.

The first was taken in a paper canoe, made by Waters & Sons, of Troy, N. Y., called the "Maria Theresa." In this he paddled and rowed down the Hudson River, then down the coast, on the inland waters to the Gulf of Mexico. The other was a Barnegat Bay sneak-box called, "The Centennial Republic." This he took through the Erie Canal, Allegheny, Ohio and Mississippi Rivers to the Gulf.

Mr. Bishop's executor, James C. Bishop, in writing to me under date of May 22, 1903, stated: "I have in my possession the paper canoe and sneak-box in which my uncle made the voyages he has described in his books, and it will give me great pleasure to present them to the A. C. A., if your association would care to have them."

After some considerable time, the boats were received and are now being cared for by the Brooklyn C. C. at their house at the foot of Twenty-eighth avenue, Brooklyn, Gravesend Bay, subject to disposition by the A. C. A.

The Association has no suitable place to care for these relics, and one, at least, is quite frail. It was suggested at the meeting of the executive committee at Rochester, N. Y., that they be presented to the American Museum of Natural History in New York City, to the Brooklyn Institute of Arts and Sciences, or some other similar institution.

The American Museum, etc., will receive them "provided we could occasionally make use of them, if need be, on some of our scientific expeditions."

The matter has been referred to the board of governors, but as the vote is apt to be delayed and there may possibly be some difference of opinion, it has been suggested that the matter be laid before the members of the Association, so that a suggestion might be made

of a proper disposition to be determined upon, and I therefore beg to call the attention of the members to the matter.

Respectfully,

ROBERT J. WILKIN,
President Board of Governors, A. C. A.

BROOKLYN, N. Y., June 25.

Rifle Range and Gallery.

The Palma Trophy.

IN reply to a recent editorial in FOREST AND STREAM, Gen. Bird W. Spencer, president of the National Rifle Association, writes in Shooting and Fishing, as follows:

"As a matter of fact, the British Association asked us to amend the rules allowing special barrels on rifles of private makers. We did not agree to this; but as the committee of the team captains had the right to make a change in the conditions, and as H. M. Pope offered to make the barrels used, the National Rifle Association thought that it would be just as well for the team to have with them a rifle with a barrel of a private maker; and, in the event that the rule was changed, they would then have the barrels with them for use.

"The writer of the article either is ignorant of this fact or purposely avoids it. He lays great stress on 'why did we take along anything but the regular service rifle?' and he also admits that the British used special barrels. He quotes the old worn-out reason which has long since exploded, that they are service rifles as issued to the troops, because the Ordnance Department put some sort of a stamp on them. The stamping of the rifles by the Ordnance Department does not make them any more service rifles than they would be without the stamp.

Colonel Bruce knew this, and when he learned the British were going to shoot special rifles, should have brought his rifles to the front, and said: 'So are we going to use special rifles, and here are the ones we are going to shoot, and I move that the team captains modify the rules so that the British, the Canadians, the French and the Americans may all shoot with special barrels.' Had this been done there would never have been any controversy.

"It is well known that the British team shot with a rifle made by a private maker, in no wise a Government contractor, that they were exceedingly fine rifles, and were in no sense a service rifle.

"This is our whole case, and there is not the slightest doubt but the committee of captains would have authorized the use of the rifle with the Pope barrel had the question been brought up for action before the match.

"There is very little use in discussing the subject as to whether the new U. S. service rifles, adopted June 19, contained an 8 or a 10-inch twist. The fact is that 5,000 rifles were made with an 8-inch twist, and that the original new service rifle contained one turn in 8 inches. Later on this was changed to one turn in 10 inches, and the 5,000 rifles above referred to are stored at the present moment in the Springfield armory.

"The writer is, of course, in error when he says that the captains, jointly or singly, had no power to abrogate or add to the conditions governing the match; but this is probably attributable to his ignorance of the rules.

"It is regretted that so long a time was taken before replying to the letter from the National Rifle Association of Great Britain. The letter from Colonel Crosbie is dated Oct. 26, 1903, and probably reached us ten days or two weeks after that date; but the holiday season was just on, and it was a very difficult matter to get together a quorum of the executive committee of the National Rifle Association of America. We were unable to do that until after the holidays, but succeeded in getting them together on Jan. 19. At that meeting the president was instructed to reply to Colonel Crosbie's communication. Without attempting to conceal any of the facts, the president did not wish to send his letter off to England until it had been personally passed upon by each member of the executive committee, so that a copy was sent to each one and returned with his comments before the letter was sent abroad. This accounts for the delay in replying to the letter, which was unavoidable.

"The Pope barrels were taken along to England to meet a condition which was likely to arise, and which did arise; namely, that other teams would shoot with rifles not strictly of the service pattern."

English Comment on the Palma Trophy.

THE fact that the American National Rifle Association have decided to return the Palma trophy affords evidence that they recognize what was made clear to every one in this country when the correspondence relating to the matter was brought to public notice. The position that now arises has also its embarrassing aspects. The National Rifle Association of Great Britain have publicly stated that their recent action was not undertaken with a view to reverse the results of last year's match, but rather to clear up certain questions which, having been publicly raised, could not be ignored. A sporting trophy that reaches England under such circumstances is hardly likely, for many years to come, to carry much satisfaction in the possession, and it is difficult to say whether an American team would care to compete for it, with recent incidents still fresh in mind, unless there existed a virtual certainty of success. All things considered, it would be odds against an American team shooting under difficult conditions of light and wind such as were markedly absent during last year's match. To compete for the trophy and fail to gain possession of it would be an experience which few American rifle shots would care to face, since no one could prevent invidious comparisons from being drawn between the results in the two contests. Although we should like nothing better than to see the same team visit us next year and carry off the prize, we cannot help fearing that military rifle shooting in America over the longer distances has suffered a check which may go far to delay the resuscitation of interest for which so many have labored during the past few years, and that the Palma Centennial trophy will return to the same kind of oblivion which it suffered during the twelve years ending in 1900.—Field (London).

General Spencer is reported to have said that the American rifles were approved by the British National Rifle Association, and quotes the Shooting Times as having stated that "the entire matter of the American barrels had been gone into by a select committee of the British organization, and by its unanimous consent the American team had been permitted to use them." General Spencer is substantially correct, as in our issues of July 25 and Aug. 1, 1903, we stated that the subject of the American rifle had been discussed by a committee of the British Rifle Association, who had agreed to let the rifle pass. All that we can say is that our informant as to what had taken place was one of the very committee that debated the matter, and we have no reason to doubt his statement. The American rifle, and the fact that the British N. R. A. had permitted an infraction of the rules that governed the contest, was the talk of the camp at the time, and it was referred to by several contemporaries as well as ourselves; so it is idle to pretend ignorance of any irregularity in the match. In these circumstances the British N. R. A. made themselves not only ridiculous in asking for information so long after the event, but they also proved that they had not properly protected the interests of the competing teams, which included representatives from France, Canada, Australia, New Zealand, Natal and Norway, as well as the United Kingdom and the United States. As far as we can judge, the only way out of the difficulty, and to render justice to all the teams that competed last year, is for the 1903 contest for the Palma trophy to be declared void.—Shooting Times.

The U. S. Service Rifle.

SPRINGFIELD ARMORY, Springfield, Mass., June 21.—Forest and Stream Publishing Co., 346 Broadway, New York City: Gentlemen—Your letter of the 15th inst. to the Secretary of War has been referred to me to answer the following questions, namely:

In June, 1903, were specifications for a United States service rifle, with eight grooves, and an 8-inch twist, approved and adopted by the United States Government?

If so, were any such rifles issued to the regular troops at any time in June, 1903, or subsequently?

Would a rifle with an 8-inch twist, and eight grooves, made by private makers, have been accepted by the United States Government in June, 1903, or afterward as service rifles?

To all of which I reply no. Respectfully,

FRANK H. PHIPPS,
Colonel Ord. Dept., U. S. A., Commanding.

IN NEW JERSEY.

Montclair Gun Club.

MONTCLAIR, N. J., July 4.—The Verona Gun Club paid a visit to the Montclair Gun Club to-day and shot a match, ten men on a side, 25 targets, unknown traps, unknown angles, loser to pay for the birds. The match resulted in a victory for the Montclair Club. Scores 180 to 162.

Event No. 3, 25-target match, prize a handsome field glass, the gift of Messrs. Schoverling, Daly & Gales, was won by Mr. Hamilton, of the visiting team, with a score of 23.

In the contest for the Parker gun, Mr. Kendall broke 46 out of a possible 50; this gives him two scores of 47 each and one of 46.

Jeannette Gun Club.

New York.—The Jeannette Gun Club held their regular shoot at Hudson County Driving Park, on July 1. The regular May shoot had not been finished on account of scarcity of birds in that month, and the sharpshooters' rifle festival had delayed the June shoot until to-day. The birds were very fast, with a stiff wind blowing, as the scores will attest. President Ehlen was here, there and everywhere to make the final contest a success.

The occasion was graced by one of our oldest ex-presidents, Capt. Disch, who is very near his allotted time, three-score years and ten, and he shot at the last bird, a fast one, and killed it in elegant style. The bird will be mounted by the club and presented to the old-timer.

Lots of excitement attended the team shoot, as owing to failing eyesight and dusk, President Ehlen had failed to score his first four birds. He had to kill to win for his side on the last bird. He was equal to the occasion, and down came the bird when near the boundary, fully 65 yds. from the shooter, with the first barrel. Then Bedlam broke loose, and some of the boys are shouting yet.

Schortemeier won in Class A, Brunie won Class B in the shoot-off, Gerdes won Class C.

Team contest, seven men on a side, 5 birds per man:
Kroeger 5, Schorty 4, Interman 4, Rohlis 4, H. Pape 4, W. Sanders 3, Ehlen 1; total 25.

Steffens 5, C Meyer 2, J. Mohrman 1, D. Mohrman 5, W. Brunie 4, Meyerdericks 4, Gerdes 3; total 24.
Capt. Disch, 28 yds., 1. The last bird.

Hell Gate Gun Club.

The Hell Gate Gun Club held their regular live bird contest at Outwater's on June 28. Though quite a wind helped the birds out when the first squad of five men were shooting, it died out later in the day. The birds had been fed too much, and were slow in getting away, therefore the scores were superior to the general average of the club.

This was a double event to-day, the club shooting for the months of August and September, and will probably finish out the year in another State, after the law goes in effect on July 4 in New Jersey, thus driving out of the State several hundred thousand dollars per year, and the abolishing of a wholesome sport. Another effect of this law—which, of course, was not considered—is the lesser demand there will be for fine guns. A shooter at the trap wants the best his money can buy. A sportsman who shoots in the field needs but a cylinder bore gun, be it a low grade arm of American manufacture or a cheap Belgian rattletrap. The artisans of our country who help make a fine gun will probably have less work in the future. And all because a few misguided fanatics can influence legislation to take the bread and butter out of the mouths of those farmer boys who make a few dollars occasionally by raising that barnyard fowl, the pigeon raised for shooting purposes.

WESTERN TRAP.

It would appear that all the gun clubs of south Minnesota were afraid of the Lakefield boys, as it has been over a year since any challenge has been issued for the elegant Peters trophy, which they have held all that time. But there came a change at last, and the Fairmount boys, a three-man team, got out courage and went after them, and though scores were low, the good shooting of Church won out for the challengers. Shooting at 50 targets, Church, for the Fairmounts made 44, Bird 38, Hick 36; total 118. For Lakefield, Morrison made 42, Palmer 39, and Bisping 35; total 116.

The fourth tournament for the season for the Missouri League of Trapshooters will be held at Richmond, Mo., July 14.

It has been decided by the shooters and the board of directors of the Winnipeg, Man., Industrial Exhibition Association that a thorough, up-to-date shooting tournament will be held during the exhibition week. This will be welcomed by the extreme Northwest trapshooters. The shoots of the past have been good ones. The programme will be liberal, and good cash additions will be made. Many traveling representatives will attend, as a number of these good scatter gun men will be at Grand Forks, N. D., in attendance at the Interstate tournament the latter part of July.

Frank L. Carter, of Butte, seems to be entitled to the claim of all-round shot of Montana. His scores with pistol, rifle, long and short range, and then his shotgun record, such as 60 doubles, unknown angles, places him at the top all the many good Montana shots.

The Blue Label Gun Club, of Sioux City, Ia., have a challenge brewing, and soon the Journal Gun Club will hear from it.

Much interest is being worked up for the Duluth, Minn., tournament, to be held July 20 and 21. This is in the circuit of shoots, and many traveling men are expected to participate.

In Canada and at some points in the West the subject is being discussed as to a return to the old position of "gun below the elbow" for trapshooting.

Articles of incorporation of the Corner Rod and Gun Club have been recorded, which will enable the Ft. Wayne, Ind., Club to purchase a large tract of land and fix up a splendid shooting Park.

The Houghton, Mich., Gun and Rod Club has looked well to the future by obtaining and planting in the streams large consignments of fish fry.

At a recent meeting of the Gainesville Gun and Rod Club a set of rules was adopted governing the fish catch in the club's lake. Only five bass or perch can be taken by any member on same day, and on but three days of each week can fishing be indulged in.

William Clayton will surely be enabled to run the chartered car to Denver on the occasion of the Western Handicap, as his crowd is assured.

The Beaumont, Texas, Gun Club has been reorganized. J. F. Fisher is president; Antry Greer secretary. A tournament will be held and all Texas shooters will be invited.

The Consolidated Sportsmen's Association, of Grand Rapids, Mich., is much elated over the installation of a set of expert traps at the club grounds.

The officers of the McQueen Gun Club, of Menominee, Mich., are busy sending out programmes of the July 13 and 14 tournament. A cordial invitation to all, and the walking is good from hotel to shooting grounds. Plenty of added money, and then a boat ride, and a general good time is assured.

The Florence, Wis., Gun Club is getting well on in practice, and the members feel proud of the scores made by Dr. Hackings. He has made one run of 31 straight.

The date for the fourth shoot to be held by the Missouri League of Trapshooters, will be July 28.

The State championship shoot of Kentucky will be held Sept. 15 and 16 at Paducah, and the Paducah Gun Club shoot will occur on the two days following.

The Francisville, Ind., Gun Club announce a shoot for July 14, and Everett Brown will be the manager.

The Panama, Mo., shooters are getting anxious about that wine set, and are turning out very much better than formerly.

The Clarksville, Ia., Gun Club members are keeping up their practice, and are open for team shoots.

The weekly shoot held by the gun club at Panama, Mo., was the last contest for the wine set. James, with 85 out of a 100, proved the winner. The prize for the next month will be a shaving set.

The West Texas Gun Club League will hold their tournament at Comanche, Tex., July 14, 15 and 16, three days instead of two. There will be \$600 added and all shooters are invited. A good time is assured for all who attend.

The cigar makers' Blue Label Club were out June 26 at the grounds in Sioux City, Ia., and had a busy hour at the traps.

There were many shoots held throughout the West on the Fourth. Reports of same in next issue.

At the shoot held by the Palestine, Tex., Gun Club last week the record of the club was broken by W. P. Allen, who made 25 straight, and then 48 out of 50.

The Belleville, Ill., Gun Club held a meeting to transact business on June 26.

The Terre Haute, Ind., Gun Club members, after returning from Indianapolis, solved the problem as to why they did not make better scores by the excuse that targets were too easy, not thrown as hard as they had been accustomed to.

The members of the Superior, Wis., Gun Club held a shoot Monday that was interesting. Shinoe won the Bunker medal with 22 out of 25. Kennedy and Fulton were but one behind.

When the circuit of tournaments starts, at Winona, Minn., July 4, it will be a warm season from that time until Aug. 1. St. Paul and Duluth will both have large shoots. R. S. Guptill, the G. A. H. winner, and many traveling men will be present. There will be \$350 added money.

The Midway Rod and Gun Club, of Memphis, Tenn., will erect a \$2,500 club house at its home on big Lake Peters Island. The officers are P. H. Kelly, President; D. Striell, Vice-President; F. W. Borgoyne, Secretary; J. H. Hudson, Treasurer.

The Schmeltzer Shooting Park at Kansas City, will be used frequently during the year for tournament purposes.

The members composing the North Side Gun Club and those of the South Side, in the City of Lacrosse, Wis., will meet on Saturday for a friendly contest at targets with a view of awakening an interest and for the benefit of practice.

When Abe Frank reached Memphis he reported that the G. A. H. was the greatest ever held in the world.

During the Winona shoot, which Elmer Shaner will manage, there will be a club shoot for the Chronicle cup that Viroqua won last year, and has so successfully held ever since.

The Beaumont, Tex., Gun Club, will hold weekly shoots during the remainder of the season. The races will be at 50 targets, with an entrance fee of 75 cents.

Shooting was quiet in the West the past two weeks, as so many shooters were off at the G. A. H.—and many of them had that tired feeling when they reached home.

Keep your eye on the Arkansas State shoot. Don't forget that only residents of the State can shoot for cash, prizes, etc.

The Earlington, Ky., Gun Club will hold a tournament on dates to be selected between July 10 and 15. Many of the good shots of the State will be in attendance.

The Missouri shooters are waking up. Last week at Memphis there were shooters present from Quincy, Ill., and Bonaparte, Ia. The Quincy men, Geise and Zimmerman, tied in the team shoots, while Page, of Bonaparte, Ia., made high score for the day.

Last Sunday was a busy day at the Kansas City Blue River Shooting Park. George Stockwell shot for the Jones trophy and scored 82 to P. Frank's 73 out of 100 targets. In an open shoot for same trophy at 50 targets, John Greninger won with 48. The final shoot for this trophy will be held this month, all the previous winners coming together for a final disposition.

The first shoot held by the Beaumont, Tex., Gun Club brought out as winner James K. Tooke, whose score of 46 out of 50 blue-rocks was very good.

Shooters at Houston, Tex., that have enthusiasm are out for the open air, having pitched tents at Sylvan Beach. The name chosen will be Open Game Club. There will be a prize shoot and same will be open to all, whether members or otherwise. The charter members are F. Fendly, F. Backenstein, B. Douglas, G. Crousk, M. Danley, P. Gallagher, P. Riley and A. Van Ropper.

Shooting for the Hunter Arms Co. trophy at Duluth, the high score went to Warren, with 24 out of 25. Wilson won the Day medal. Bob on the second trial, won the Ponton & White trophy.

The third annual tournament of the Northern Gun Club was held at Antigo, Wis., June 29. The high score was made by Heer, 146; Le Compte 139, Lord 129. High amateur, Paul Brown, of Rhinelander, 129; A. Mollie, Antigo, 129; Bennett, Ironwood, 128. The Hoffman House cup went to Mollie.

The regular shoot of the Bridge City Gun Club, of Logansport, Ind., found Whitesell at the front, as at 50 targets he made 41.

He Knew.—"You must visit our new country club," said the suburbanite. "The grounds are beautiful; the golf links superb. You won't find such scenery elsewhere." On entering, the grounds the first thing that strikes your eye—"I know," interrupted the city man, "A golf ball."—Philadelphia Press.

PUBLISHERS' DEPARTMENT.

Those "Newspaper Laws."

AN important ruling in regard to what are known as "newspaper laws" has been made. These so-called laws provide that subscribers to newspapers are liable for the price thereof unless they give express notice to discontinue, or when they give notice to discontinue without paying arrearages, or when they refuse to take papers from the office, and that the publisher of a newspaper can have any one arrested for fraud who takes a paper and refuses to pay for it, and that it is an unlawful act to allow a subscription account to run on for six months or a year and a half and then tell the postmaster to mark it "refused" or send the editor a notice to discontinue the paper.

The Post Office Department has time and again informed parties making inquiries, and the public generally, that there are no such laws. The ruling now made is to the effect that a publisher who makes a demand for payment of the subscription price of his paper through the mails, accompanied by a threat of enforcing such pretended laws in case the demand is not complied with, may be prosecuted for attempting to obtain money under false pretenses, provided he knows that such so-called laws have no existence as laws, or decisions of the courts.

Concerning Proctor's.

"The Magic Kettle" has proved a most sensational attraction at Proctor's Twenty-third Street Theatre, where it will remain for a longer run. There is something peculiarly appealing to the present time in the thought of the intense cold created by the contents in the mystic kettle, which freezes everything plunged into the boiling liquid within, and not the least attractive feature of the performance is the distribution of ice cream, made in sight of the audience in a chafing dish. In securing the Magic Kettle, Mr. Proctor has shown his customary enterprise, and is making appeal to his audiences with the very newest idea in magic, which will crowd the house for some weeks to come; but the Magic Kettle is but a single feature of the excellent vaudeville show one may always count upon seeing at this charming theatre. More than ever at the present time has it become a rendezvous of the visitors to the shopping district. They here find an opportunity to rest and refresh themselves before proceeding uptown or to the ferries.

The wildfowler knows very well that without good decoys he is not likely to get good shooting. How often have we all of us seen cunning ducks, headed straight to the decoys, suddenly become suspicious and flare or veer, not to be called back by any means. The decoys manufactured by W. J. Mason, of Detroit, Mich., have made their way among duck shooters by merit. We have seen them and they are lifelike and good. Persons intending to enlarge their stock of decoys should write him for a catalogue.

BAKER GUNS SHOOT HARD
and are SAFE.

They are noted for this wherever known, and that is almost everywhere. Ask the man who owns one.
Fine Trap and Medium Field Grades, \$25.00 to \$200.00 and up.
Inquire of your dealer or send for full descriptions.

BAKER GUN AND FORGING CO.,
Cor. Liberty & School Sts., BATAVIA, N. Y.

MY TRAP SCORES

A pocket trap score book, containing 50 pages of score sheets and the Interstate Association Rules for target and live bird shooting, and for shooting under the Sergeant System. The cover bears the title "My Trap Scores," and the pages, in number and form, are arranged to make a complete record of the shooter's doings at the traps. The pages are ruled to make a record of the place, date, weather conditions, number of traps, number of shooters, gun and load used, events, etc. The score sheets are ruled for 25 targets. Bound in leather. Price, 50 cents.

SKYLARKS ON LONG ISLAND.

WE asked Mr. Wilmot Townsend to investigate the truth of a report that European skylarks were to be found on the meadows at Rugby, which is a section of Brooklyn, and so within the limits of Greater New York, and his report is printed in our Natural History columns to-day. He found the birds, and has given explicit directions for others who may wish to see and hear them. We have at various times recorded the presence of the skylark at different points on Long Island on the outskirts of Brooklyn; these records run back ten or fifteen years, and presumably the Rugby larks are descendants from birds which were introduced from England many years ago.

A friend of Mr. Townsend, who spent his boyhood near Flatbush, Brooklyn, relates that there, sixty years ago, he used to hear the skylarks and watch them in their song flights. There are records of a skylark importation as far back as the middle of the last century. In the year 1846, Thomas Woodcock, the president of the Natural History Society, of Brooklyn, brought over from England many specimens of the field birds of that country, together with a large number of eggs, which, on their receipt here, were placed in the nests of our own warblers, and in the ensuing season goldfinches, linnets, bullfinches, skylarks, and English sparrows were seen at Greenwood, in the suburbs of Brooklyn, and at the Wallabout, another suburb, a colony of the English skylarks was successfully established, and wintered two seasons. In the spring of 1847 there was printed in the Brooklyn Advertiser a poem written by R. W. Hugh, who was an associate of Wm. Henry Herbert (Frank Forester), in the instruction of youth at the Rev. R. T. Huddnot's school at Bloomingdale. The poem, revised by Frank Forester, was in the nature of a "humble appeal of a colony of British skylarks to the sportsmen of New York and Brooklyn, sung at the Wallabout on the 1st of May, 1847, ten minutes before sunrise." It must have been a queer race of sportsmen in 1847, if they needed the persuasion of poetic appeals to withhold their shot from the caroling lark, although in these degenerate days there is a small army of hoodlum shooters going out from our cities for whose game bags the skylarks would be most acceptable tidbits.

AUDUBON AND SQUIRREL BARKING.

IN one of those sketches of American frontier life which are interspersed through the "Ornithological Biographies," and have a historical importance quite independent of ornithology, Audubon describes the killing of squirrels by Daniel Boone by a method called "barking." The feat was so to aim as to strike the bark of the tree under the squirrel, and by the concussion to kill the game. The story has been accepted for generations, but now a skeptic has arisen to question it. The doubter's own grotesque ignorance of rifles and squirrels and rifle shooting squirrels is so manifest in what he writes that he clearly is no "authority" to whom much attention need be given. It is to be noted that Audubon's account of squirrel barking is not the mere retelling of something he had heard; he explicitly states that he was an eyewitness of Boone's squirrel barking, just as he describes it; and that subsequently he saw the same feat performed by others. It is incredible that Audubon should have incorporated into his great work this story of squirrel barking as a deliberate piece of fiction, or if he had not seen it done, or at least had not seen something which he believed to have been the thing described.

IT JUST HAPPENED SO.

THERE were noted in these columns not long ago sundry coincidences which were typical of those so often observed by all of us in various fields of life. Here is another one not unworthy of record: The papers of Monday of this week contained an announcement that the Spanish General Toral, who commanded the garrison at Santiago when that place surrendered to the Americans, died in a lunatic asylum at Madrid on July 10. And in another column of the same page it was told that on the same day, at Medina-Sidonia, Admiral Cervera was presented by some American with a testimonial of gratitude for his conduct at Santiago in caring for Lieut. Hobson and the American sailors after the sinking of the Merrimac.

PAINS AND PENALTIES.

IN the old days, when a hunter took venison in the King's forest contrary to the laws made and provided, they put out his eyes or cut off his hands or feet or other members, to the end that the taking of the King's game might be discouraged. It proved, however, as with all like unseemly and inordinate penalties, that the ultra rigorous law did not accomplish its purpose.

Writing from Nebraska, Mr. A. D. McCandless tells that the law of that State, which declares forfeit the gun and ammunition and dog of a shooter who violates the game law, has been held by the courts to be unconstitutional because it confiscates property without due process of law. On the other hand, a New York statute declaring forfeit as public nuisances fishing nets in certain inland waters and authorizing their summary destruction by the fish wardens, has been held to be constitutional by the United States Supreme Court.

It is nevertheless, as Mr. McCandless well says, a grave error to overdo the severity of a penalty attaching to what the community is prone to regard as a venial offense, and under certain circumstances a forfeiture of gun, dog, and ammunition might be considered a punishment that did not fit the crime. It makes a difference, too, who the culprit may be. A jury of his neighbors would be loth to find guilty with such a penalty a neighbor who might violate the law, whereas they would with eagerness condemn a stranger who was intent upon carrying his booty illicitly out of the State. There is usually a cheerful willingness to punish the foreigner, and these non-resident game laws make foreigners of us all when we stray beyond the confines of our own State.

THE PERILS OF ANGLING.

ON Thursday of last week two Chicago boys were digging angleworms in an alley preparatory to a fishing excursion. A fallen telephone wire interfered with the quest of bait, and intending to push it to one side, one of the boys grasped it. The wire was a live one. When the boy screamed, his companion seized him, to pull him away. Both were shocked, and both died on the way to the hospital.

On Jamaica Bay, a favorite fishing ground of New York city, a fisherman in a boat off Barren Island got a tremendous bite, jumped up in his boat to play the fish, was hauled overboard, and disappeared beneath the flood. Companions dived for him, and after a strenuous time got him back in the boat, unconscious, and rowed him to the shore, where a physician revived him by artificial respiration, and sent him off to the hospital. The fish, which is described as at least half a dozen feet long, and having the appearance of a shark, was last seen heading for the inlet, towing line, rod, hook and sinker.

The next day, in the same waters, a lone fisherman in his boat off Canarsie, after long and patient waiting for a bite, had a tug on his line, and was seen to jump up and begin excitedly to haul in hand over hand, when he lost his balance, toppled into the water, disappeared, and has not been seen since.

THE DRUM OF THE DRUMFISH.

THE drum of the drumfish has in it something of the weirdness and mystery of a marsh bird's croak in the darkness, and the cry of the catfish is, under favoring surroundings, positively uncanny. To the observations in another column many other experiences and records might be added. William Elliott says in his "North Carolina Sports," that in the waters of Port Royal and Beaufort in calm weather and in the afternoon, which is a favorite time for drumming, the drum might be heard at a distance of several hundred yards from the river. His explanation of the phenomena was that "it is the universal passion alone that gives them utterance," a view shared by George Brown Goode, who suggested that as the sound is heard especially in the breeding season, it "is doubtless the signal by which the fish call to their mates." This is a theory which should sustain and soothe the weary drum fisher waiting for a bite, and getting only the poor satisfaction of hearing the drum in the water beneath him. If it be a lure, it may bring another within the attraction of his bait.

There are circumstances, however, under which the voices of fishes may be a very real distress. Silas

Stearns once confessed that the grunting of the catfish when many were present was very annoying to him, and he passed more than one wakeful night from hearing it on the southern coast when the fish were swimming under his boat.

The drumming of the squeteague has been studied at the Marine Biological Laboratory at Woods Hole, Mass., by Prof. R. W. Tower, of Brown University, and these conclusions are given in the Bulletin of the United States Fish Commission:

1. There is in the squeteague a special drumming muscle, lying between the abdominal muscles and the peritoneum, and extending the entire length of the abdomen on either side of the median line.
2. The muscle fibres are very short, and run at right angles to the long axis of the muscle.
3. The muscle is in close relation with the large swim-bladder, and by its rapid contractions produces a drumming sound, with the aid of the tense bladder, which acts as a sounding-board.
4. This muscle exists only in the males, and only the males are able to drum.

PUBLIC FISH IN PRIVATE PRESERVES.

THE long contested Lamora-Rockefeller fishing trespass suit has been decided by the Appellate Division of the New York Supreme Court, and the finding is what was predicted in these columns when the case was in the lower courts.

The circumstances in brief were these: Mr. William Rockefeller acquired certain lands in the Adirondacks, the waters upon which had been stocked with trout by the State. Before coming into the possession of Mr. Rockefeller the waters had been open to the public, and Oliver Lamora, an Adirondack guide and fisherman, had been accustomed to fish in them. Under the new ownership he maintained that he was entitled to continue to fish, because the waters had been stocked by the State, and an old law had declared that water so stocked should be free to the public. Mr. Rockefeller contested the claim and prosecuted Lamora for trespass. The justice's court and the county court acquitted Lamora. The case was eventually appealed to the Appellate Division, in whose decision is involved a declaration of the principle that the waters of a private preserve are not open to the public, even if they have been stocked with fish from the public hatcheries. This is presumably good law, and it assuredly is good sense. Public fish should not be put into private waters; and the commissioners should do their best to confine fry distribution to public waters; but the opening of private waters stocked by the State is not a remedy the courts will sustain.

ANTS AND SAINT.

THE cotton boll weevil threatens the Southern States with the loss of half the cotton crop, whose annual value is \$500,000,000. The Agricultural Department has found in Guatemala an ant which is believed to be an enemy of the boll weevil able to cope with the plague. Having sent agents to the home country of the ants, the Department proposes to introduce colonies of them into Texas experimentally, to study their ways under the new surroundings. Texas regards the proposal with alarm. It is apprehensive that the introduced ant may prove to be itself only a new and terrible pest.

In earlier days these insect plagues were treated in a fashion at once simpler and more efficacious. For instance, when in the year 1584, the inhabitants of the Province of Havana could no longer endure the ravages of the ants, the Cabildo—that is to say, the chapter of the diocese—concluded that a remedy would be found in the putting away of the delinquent patron saint, and installing a new one in his place. Accordingly, an election having been held by the chapter to this effect, the bishop conferred upon San Marcial the dignity of patron, agreeing to celebrate his *fiesta* and to keep his day yearly on the condition of his interceding for the extermination of the hormigas and vivijaguas. The saint, it is to be concluded, was pleased graciously to accept the conditions, and faithfully kept his part of the bargain, and did his insecticidal stunt, for the hormigas and vivijaguas ceased to trouble and San Marcial is still revered and loved, and his *fiesta* is celebrated, though not with the old-time vim, for Cuba is now a republic, and republics are ungrateful,

THE SPORTSMAN TOURIST

The Passing of Outlaw Jake.

THE settlement of Goughville is a pre-eminently law-abiding one, and consists of about six deacons, four justices of the peace, two ministers of sorts, and some four or five hundred ordinary citizens. It is situated thirty miles from a railway, the inhabitants are all farmers, or interested in farming, and the only other thing they take any stock in is religion. Mr. Cripps chose this modern Garden of Eden as an abode when he found that the game warden of the Province of New Brunswick were "after him." The "Guvvillers," as they are commonly termed by people who do not claim Goughville for their place of birth, cared very little for the fact that Mr. Cripps and the authorities of the neighboring Province had fallen out; but when Mr. Cripps supplemented his income by the manufacture and sale of "white-eye," public sentiment was aroused, and the result was an information against him for killing moose in close season, and having the same in possession. I was perfectly cognizant of the fact that Mr. Cripps had been informed on for no reason other than that he was selling whiskey, and that the deacon who laid the information had no more sympathy with the game law than Mr. Cripps had, but I had received "letters commendatory" or the reverse from a confrere across the line, and I considered that the sooner the man was out of X— county, the better it would be for the game.

The open season commences on the 15th of September. On the night of the 14th I visited the Cripps domicile, in company with a deputy sheriff of X— county, and a constable. We captured Mr. Cripps, two carcasses of moose meat, two fresh hides, and a number of new moose snares. The justice of the peace who issued the warrant "soaked" the defendant for all he was worth, and in default of payment, sent him to jail for the longest term the law allowed.

I was agreeably surprised to find the authorities and myself of one mind for once. As a rule, it was hard work to get a conviction for a breach of the game laws, but in this instance I consider the culprit got all he deserved. The reader may ask, why was he not indicted for selling liquor without a license? The answer is that the inspector of license had a number of valuable Jersey cows, and a pound or two of paris green would have squared any outstanding grudge, with a large balance on Mr. Cripps' side. I had no cows, and no house to be burnt, and as far as any fear of physical violence went, I could have taken Cripps by the scruff of the neck and the seat of the pants and "fired" him out of the window.

When the sheriff arrested him, he also levied on his goods and chattels to satisfy an outstanding judgment. Apart from the moose meat, which was of course contraband, there was about ten dollars' worth of furniture, an old Snider rifle, a few rusty traps, and a black setter dog. I purchased the dog for fifty cents at sheriff's sale. My motive for doing so was a remark one of the bystanders let fall, "That there dog's no manner of use; Cripps never let him run a bird, and if he saw one, he would only sit down and look at it." Cripps remarked, after we had the handcuffs on him, "If only old Jake had been loose, there would have been fun for you fellows." I took no stock in the remark at the time. Two days after the sale of the outlaw's goods, I received a telegram from the game warden, who had written me about Cripps before: "Buy Cripps' dog for me if possible; hear owner is in trouble; will write." I wired back, "Have already bought him for myself. Sorry." My friend answered: "Congratulate you on having the best dog that ever ran on Tantamar marsh."

I regarded this as a bit of gentle sarcasm; but when I had had the beast a fortnight, I found there was more truth than poetry in my friend's wire. To make a long story short, I shot over Jake all that season, and refused a hundred dollars for him. When the winter came, I accepted an invitation to go South with an American I had shot with, and Jake went with us. He did as well on quail as he had done on ruffed grouse, cock, and snipe; he was a good retriever, and his nose was perfect. Every now and then, when I read the report of some prize winner and his achievements, I noticed that his grand-dam or grand-sire was by Outlaw Jake. There was one thing about the old fellow I didn't like—he was as cross as two bears if anyone came near me when he was around. I had to "whale him" on more than one occasion for this; finally I considered that I had knocked the nonsense out of him.

I went home in March. The weather was perfect in South Carolina then, but when the steamer put into Halifax a raging blizzard was blowing, the trains were blocked, and it was ten below zero. Jake and I made our way to the hotel, and on the following day we returned to Goughville. I think the old dog rather enjoyed the thirty-mile scamper after the sleigh, and the sensation of feeling snow under his pads once more. I found that Mr. Cripps had served his sentence out, and that he had left the county, for which I was truly thankful.

For two years I shot over old Jake, and each year he did better work. I raised a number of pups from him, and sold them at a good price. Then I moved away from Goughville, rather to my regret, as the woodcock shooting there was superb, and I had had it all to myself.

This was in the days when breechloaders were scarce, hammerless guns unknown, and smokeless powder an

unheard of thing. Woodcock were known as mud-hens, and when my housekeeper was asked where I was, at any time in the months of September and October, when I wasn't moose hunting or looking up snares, her reply would be, "He's gan a-mud-hennin." Alas! those blissful days have passed; the Guvvillers have found out the commercial value of the mud-hen, and the utility of the setter in pursuing it. The bird-dog that hunted and treed partridges, is extinct in the land, and woodcock will soon be extinct, too, unless pot-hunters and game hogs can be restrained.

Both cock and snipe were numerous in my new district; so were sportsmen, and it was my habit to take a week or so every fall on the old ground. Our covers were later—say from October 10 to November 20. Now, while I was at Goughville, I had made the acquaintance of one Tommy Fergusson, a member of Her Majesty's Inland Revenue Department. Mr. Fergusson, whose duties often took him to the woods in pursuit of the illicit still, had given me valuable information, as to moose snares, on more than one occasion, on the understanding that I should reciprocate in the matter of "moonshining." As the merry moonshiner often replenishes his larder with moose meat, and preferred to snare the game to calling or creeping it, I was glad to drive a bargain with Tommy. He was a man who not only understood his work, and loved it, but he was admirably fitted for it physically. Over six feet in height, big and strong in proportion, and plucky as a bulldog, he did more to break up illicit distillation than any two men in his branch of the service. When he turned up at my new place of abode, five hundred miles from Goughville, and registered at the hotel I boarded at as "Mr. John Smith," I concluded that he would prefer to maintain his incognito; so I passed him in the hall and did not recognize him. When he was introduced to me later on by the landlord, I found out that he was interested in nickel mines, and required a man who knew the woods to show him round. Nickel was the fashion in those days, the Sudbury works were at their zenith, and every rock that looked out of the common was supposed to be nickel ore.

In the privacy of his own apartment, Tommy confided to me that he had just run down a still of unusual size, and that the capture of the parties operating it would mean the conviction of several large firms who were buying their product. The "pot" was located in an abandoned cook-house, a mile from the nearest road, the operators were one Silas McDorman, late of Judique, in Cape Breton, and a small man whose name was not known. McDorman was a giant; he did all the hard work for the concern Tommy was after. He lugged in the molasses from which the alcohol was made, and later on backed out the finished product to the store of the worthy patriarch, who forwarded it to its destination on the schooner Rechabite.

By what means the Department of Inland Revenue gained this information, I am unable to say; anyway they had it, and Tommy Fergusson was detailed to capture still, moonshiners, and the Rechabite at any cost. He had a supreme contempt for the ordinary constable, and one of the Provincial force had been detailed to assist him. He had been given *carte blanche* in the selection of his other help, and he wished me to form one of the party. As I had nothing particular to do at the time, I had no objection, especially as there might be a little money in the racket. The time to act had not arrived, and for some days Tommy and I hunted for nickel, and incidentally for partridges. We found none of the nickel and plenty of the birds. We avoided the old cook-house, which had been erected by a now bankrupt mining company. The entrance to the road which led to it was barred by a trespass notice; the property, consisting of about five hundred acres, was "in law," and there was no possibility of approaching it without being seen. A more ideal place for moonshining could hardly be imagined. The cook-house was provided with water from a spring some distance away; the fuel supply was unlimited, and no one other than a constable or peace officer had any right to intrude. Alcohol, at the time I speak of, was worth \$3.50 a gallon in Canada (it is worth nearly \$5 now), and Tommy estimated that our friends were turning out nearly 300 gallons a month, which meant a loss of over \$900 a month to Her Majesty's revenues from this one still. We met McDorman once or twice when we were buying stuff at the store he left his alcohol at. Of course we took no notice of him, nor he of us. Though he did not know Tommy Fergusson, Tommy knew him, having arrested him some years previously for handling "white-eye." On that occasion Silas had "squealed," and in consequence got off with a nominal sentence. Tommy had grown a beard since then, consequently he was not recognized.

After we had passed several days shooting partridges, and incidentally watching the cook-house through our glasses, the Provincial constable turned up. He had been working on the other end of the line.

What passed between the two officers, I am unable to say, but the night after Provincial Chief Constable Bright's arrival, Tommy told me to get ready for a coup. "Getting ready" meant putting my coat and hat on, taking a good stick in my hand, and stepping into the express wagon, driven by a local constable, in which we hoped to bring back our prisoners.

It may seem strange that we took no firearms. As a matter of fact, Tommy had a .44 vest-pocket derringer,

and Mr. Bright had a revolver of sorts. We drove about four miles, and had almost arrived at the road to the abandoned mine, when my dog Jake came in sight; he had evidently escaped from the stable I kept him in, and followed the team. "Never mind the dog," said Tommy, when his friend growled out an oath, "he's as good as a man any time, and knows every word you say to him." I spoke to Jake and he fell in behind the wagon, where he remained until we reached the spot where we intended to get out. The driver was to give us ten minutes' start, then follow us at a walk, and—we hoped—reach the cook-house just as we had our birds bagged.

It was a quiet fall night, warm and damp, with very little moon. We made our way along the disused road, Jake keeping close to heel, until we arrived at the mine. An abandoned gold mine is perhaps the most forlorn looking place on earth. The piles of rock, the rotten derricks, and half ruined shanties look dismal enough by day, but they are ten times worse by night. The cook-house, a two and a half story building in good repair, stood close to one of the dumps, and in the shadow of that and the shaft-house we were enabled to get within thirty feet of it. No light came from the windows, which were closely shuttered. As we stood for a moment in the shadow I caught a whiff of a sour, pungent smell, and noticed a spark or two drift upward from the chimney of the silent house. "Malt as well as molasses," murmured Tommy. "Wonder where they got it, or if they made it. We'll soon know, anyhow." A pile of poles lay near; Tommy selected a medium sized one, which the three of us took up. Advancing to within ten feet of the door, he called on the inmates of the house to "Open in the Queen's name," and without waiting for them to reply, the impromptu battering ram crashed against the panels. The door went down at the first shock; we dropped our pole and rushed in. The house was full of steam, and the same acrid smell we had noticed outside pervaded the place, only in a tenfold degree.

McDorman met us as soon as we entered. He had a broadax in his hand, and looked as if he meant to use it. "Better drop that ax, and come along with a whole skin, Silas," said Mr. Bright. "There are four of us here besides the dog, and a few more outside." The big Scotchman hesitated for an instant, then he surrendered.

"Where's that little snake that works with you?" asked Bright, when he had handcuffed McDorman.

"He's upstairs, ill in bed, if he is still alive," was the reply.

Leaving the prisoner in Bright's care we ran up the staircase. The dog had preceded us a moment before. The bedroom door was open, a fairly comfortable bed was in one corner of the room, a table stood by it, with an oil lamp and some medicine bottles on it. On the bed lay an under-sized man, partly dressed, on whom Jake was fawning and slobbering with all his might.

"Sammy Cripps, by all that's holy," said the officer. "I thought you were across the line, Sammy."

As he spoke the dog dropped from the bed and wheeled round. I am tolerably well acquainted with the facial expression of all kinds of dogs, and I can truthfully say that I never saw a dog's face change from ecstasy to utter fury in such a brief time.

"Look out for the dog, Tommy!" I cried.

"Never mind the dog—it's the man I'm after," he replied. "Samuel Cripps, I arrest you in the Queen's name. It's no use to sham sick."

As he said this, he took a step toward the bed. Jake uttered a sound more like a roar than a bark, and launched his fifty odd pounds of weight at the excise-man's throat like a bolt from a catapult. Fergusson was a man of more than ordinary strength, but he was taken by surprise, lost his balance, and in an instant he was on his back, with Jake tearing at his throat. The lamp went out, and I could hear Bright, in the hall below, shouting to me to shoot the assailant.

It was impossible for me to catch the dog, he refused to heed my frantic shouts, and I had no matches. Then came a flash, a smothered report, and an odor of singed fur; Jake rolled over on his side, and Fergusson staggered to his feet. The sick man managed to find the match-box, and struck a light. I picked up the lamp which had been upset; there was some oil in it, though the chimney was broken. Jake lay motionless on the floor, the blood running from a bullet wound in his side; Fergusson, covered with blood, struggled to his feet, clutching at his neck, from which the blood was streaming.

The local constable had arrived by this time; Bright left his prisoner with him and came upstairs. I have a fair knowledge of emergency surgery, and with Bright's aid I bandaged the wounded man with strips of torn up sheeting. He was too badly torn to go back to town, so it was hurriedly arranged that Fergusson and I should remain in charge of the house until Bright could convey his prisoner to the jail and return with a surgeon. McDorman's bed was in the next room to Cripps'; we carried the excise-man in and laid him on the bunk. Then the team drove off with the prisoner on board, and I was left alone with the sick man, my wounded friend, and the dog. Cripps told me where to find some brandy, and I gave Fergusson a drink. Then I sat by him for nearly half an hour, when I heard a low whine. "Let me have another cartridge, Fergusson," I said. "That dog has come to life again, and I want to put an end to his misery." Fergusson replied that he hadn't another car-

tridge about him. Then I heard Cripps calling me by name. I left Fergusson, and entered the next room. Jake had dragged himself across the floor to the bedside—his back was broken by the pistol shot—and he lay there licking his former master's hand.

"For God's sake give the dog a drink of water and put him on the bed beside me. I didn't set him on none of you men. He was always that way from a pup."

I went down and got the water, the dog drank all I gave him, and allowed himself to be lifted on to the bed without protest. Cripps placed his thin arms round the black setter's neck and kissed his nose.

I went back to Fergusson, who was feeling very weak from loss of blood, and remained with him until the team returned with the doctor and Bright. The doctor examined the exciseman's wounds, and pronounced them serious. For nearly an hour he worked at them. When he had finished, I suggested he should go in and take a look at the sick moonshiner. I borrowed Bright's revolver at the same time, intending to put an end to poor Jake's sufferings. Dog and man lay motionless on the bed; the man's arms were still round the dog's neck. The doctor lifted up one hand and let it fall. "Dead," he said, "and the dog's dead, too." The derringer bullet had cut one of the intercostal arteries, and the dog had bled to death internally.

At the inquest, an autopsy showed that Cripps had died from heart-failure, following an attack of pneumonia. We were exonerated from all blame, and the outlaw and his dog received decent burial. Fergusson was an invalid for some weeks—in fact, he came very near dying from his injuries. The seizure was one of the most important he ever made; numerous respectable firms were interested in the "pot" we seized, and though McDorman only got two years for his share in the business, the department was some thousands of dollars the richer by our night's work. I received a check for \$200 for my services, with an intimation that there was more to be earned if I wished to.

These events happened many years ago. The dog I am now shooting over is an old one; he is good enough in his way, but he can't hold a candle to his great-grandfather, old Outlaw Jake. EDMUND F. L. JENNER.

NOVA SCOTIA.

A Summer in Newfoundland.—IV.

(Continued from page 9)

EARLY the next morning I took my stand high up on a rocky platform overlooking the pool. It was the only spot from which a cast could be made, but for such a purpose it was one of the finest spots in Newfoundland, if not in the world. Forty feet below flowed the river, eddying along through the narrow chasm for thirty yards, and every foot of it could be reached from my elevated position.

The sun was bright that morning, and its rays lit up the sombre depths to such an extent that I could see clearly some forty or fifty salmon massed in a great school lying like logs far down among the rocks of the bottom. A dozen more were lazily basking in the sun's warmth but a few inches below the surface, and occasionally one would swim around and around among the eddies, as if restless from his long imprisonment; and these active fish that swam near the surface were the very fish that jumped at my fly almost as soon as it touched the water. Not once did I succeed in enticing a salmon from below, although there was not an hour in the day when half a hundred of the loggy fellows did not see a silver doctor skipping innocently above them, or drifting down past their very noses. So futile were all early efforts in trying to persuade these bottom fish that later it was entirely despaired of, and no casting was done unless a salmon appeared circling around in the current. It was fishing of a very different nature from that at the lower pools; no icy water to wade, or sharp rocks to cut your boots; no weary casting, endless and uncertain, over pools which might contain a fish and then might not. It was fishing without work—angling that was definite and certain, depending more upon the eyesight than upon any skill in casting a fly.

Gaff in hand stood Jim, thirty feet below me, in a little niche on the face of the wall; and the moment a salmon rose from below he called lustily to camp for "d. sporter," or if I happened to be already stationed on the rock above, a few well-directed casts with a single fly usually resulted the right way. But not only was the method of fishing totally different from that required in the shallow waters further down stream, but the salmon when hooked acted in a different way. They were prone to be sulky, and after striking they usually sank like rocks to the bottom, where they remained without budging for some fifteen or twenty minutes, trying to tire me out. But after this introductory loginess had passed off they entered into the spirit of the game with zeal, running just as far, and leaping fully as often, as any killed nearer the coast.

One day, when trying for sea trout in the very swiftest of the current, where salmon rarely lurk, I took, in quick succession, three fish which played as gamely and jumped as frequently as the liveliest grilse in the river—but no livelier. They were long and slender, three or four pounds in weight, and at first I mistook them for small sea salmon. But after a careful comparison with one of the latter, their deeply lunate tails and large pectoral, dorsal and adipose fins, together with other distinguishing peculiarities, proved their identity beyond a doubt as ouananiche, the little fresh-water salmon of the inland lakes and rivers, probably washed down over the falls from the ponds above. Ouananiche seems to be the usually accepted orthography of the word, pronounced whon-an-iche or whan-an-iche by the Montagnais and French habitants of upper Quebec. At all events, that spelling seems to possess a prior literary and historical claim for accuracy to either wininiche, ouananesh, winaniche, or any of the fifteen or twenty anglicized corruptions of the word. According to a letter reprinted by E. T. D. Chambers in his delightful account of "The Ouananiche in its Canadian Environment," the oldest book of the Montagnais Mission, written by a Jesuit missionary some two hundred and fifty years ago, spells the name oua-na-niche. Neither William nor Jim had ever heard of such a fish as a landlocked—or, more properly speaking, a fresh-water—salmon (for in many localities it is confined to the fresh water merely by choice, not by

necessity), and although they both informed me that small salmon did inhabit some of the interior lakes, yet their dull fishermen's intellects were lacking in sufficient acuteness to investigate, or even to question the possibility that such fish never migrated to the ocean. The Newfoundland guides whom I have questioned concerning this fish, and who knew it sufficiently to distinguish it from its salt-water brother, pronounced the name win-in-iche or whin-in-iche, although none that I ever met were conversant enough with the letters of the alphabet to write the word on paper or spell it correctly. But after all, the name is of ancient Indian origin, a name of the Montagnais, taught to the early French pioneers of the continent, and merely an introduction into the animal nomenclature of Newfoundland. Ouananiche, however, is not the only Indian name which has been tortured by the spelling and pronunciation of to-day. There are many such; but of all perhaps the most glaring illustration of modern corruption we find in the many misnomers applied to the giant pike of the northern lakes and rivers. At the present time probably no creature in America—unless it be the cougar—is saddled by more titles philologically incorrect as those applied to *Esox nobilior*. Mascalonge, muskellunge, muskellonge, maskinonge, plain lunge, and half a score more, have been adopted indiscriminately by different writers. The derivation of the word mascalonge, it is true, has been explained as originating in the old French phrase masque allonge (long face), and it seems a possible explanation for the appearance of an l or ll in the name. According to the best authority, however, *Esox nobilior* was the Indian mashk kinongé (deformed or bad pike), because it really was kinongé or great northern pike. It is a pity that so many of the old Indian names have been changed or translated into meaningless equivalents—names used by the aborigines centuries before the white man ever paddled a canoe or cast a fly over the broad rivers of Canada. For ages past the giant pike and the little fresh-water salmon have helped to nourish entire villages of hungry Montagnais; and many times as the eager fisherman pulled in his line and unhooked the struggling quarry, to him it was nothing more nor less than a mashkinongé or a ouananiche.

Contrary to the generally accepted belief, the fresh-water salmon is by no means confined in its geographical distribution to the vicinity of Lake St. John and the Hudson's Bay region, but occurs in at least four different localities throughout Maine, probably in New Brunswick, and according to such excellent authority as Mr. A. P. Low, over the whole eastern watershed of the Labrador Peninsula. In Newfoundland the ouananiche is found irregularly in many localities, but as yet no systematic effort has clearly defined the limits of its distribution. During the hunting season of 1902, when camped on the shore of George's Pond, I saw several good sized fish break water in the southern cove, but no attempt was made to take them with the fly. Some days later, however, a number of smaller ones were taken in Butt's Brook, which is a tributary of George's Pond, and a few succumbed to the fly at the inlet of Terra Nova Lake. In fact, the whole Terra Nova system contains fish which are undoubtedly ouananiche, as a great fall nearer the coast prevents sea salmon from ascending to the ponds and upper reaches of the river. I have seen them jumping in Cross Pond near the west coast, and although I have never fished Red Indian Lake, have been informed by good authority that its waters abound in ouananiche, while a few have been taken in Gander Lake and the upper Exploits. Mr. Arthur Winter, a man thoroughly familiar with the Newfoundland interior, has killed them on the Gambo, while James Howley, of the Government Survey, writes me that they occur in many of the interior lakes, whose waters ultimately empty into the ocean.

Cooking at the falls required far less culinary skill than in those days of luxury when camped by the ocean we dined regularly on lobsters and doughnuts, oatmeal with real milk, or eggs, codfish, and fried cakes. In the absence of John, William had been promoted from the menial position of packer to the distinction of cook and packer combined; and under his care our daily menu certainly gained in originality what it lacked in variety. Salmon the inevitable was always the *pièce de résistance* three times a day; and just how to cook it so that it would taste as little as possible like salmon was an imperative order issued to William. He boiled it, "skivered" it, roasted it in the ashes, fried it with roe; or perhaps we enjoyed it salted and smoked, or just plain smoked without the salting, and each time we heaved sighs of relief when our duty was done and the plates emptied. Over four weeks of fresh salmon—ninety meals of it—produce a wonderful craving of the appetite for something else; anything, in fact, provided it is not a fish with pink flesh. For breakfast we usually sat down to a repast of bread, tea, oatmeal and salmon. This was varied at dinner time by substituting rice for oatmeal, coffee for tea, salmon served in a different style, and a smoke for dessert; while in the evening hot biscuits were added at the expense of the rice, while a couple of roes were relished as luxuries. Anyone who has ever tried real prime salmon roe when the eggs are as large as small peas and as hard as pig nuts, will rarely repeat the experiment unless, perhaps, as a substitute for the fish itself. But the berries out on the barrens were fast ripening, and Newfoundland is truly an island which produces numerous kinds in great profusion. Old Jim ate quantities without stopping to consider either their species, size, color, or degree of ripeness, and repeatedly informed me that "dey wuz all good, not a pizen berry on de country;" and he was right, as far as their edibility was concerned. But it does not always follow that a pretty berry, when tried, is found pleasant to the taste, or that its non-poisonous qualities recommend it to the palate, and many possessed no more flavor than a raw potato. There was a small species of cranberry, insipid and tasteless, which in places literally carpeted the hills with red; while raspberries flourished in profusion along the river banks. Huckleberry bushes covered acres of the open country, but as yet the fruit was green and unfit for use. The prize of the lot, however, proved the "bake apple." Just why it is called bake apple I do not know, as it resembles in no way an apple, growing much the same as a low bush blackberry; but I do know that it is small, about the size of a cherry, soft as a persimmon, yellow as a buttercup, and possesses a delicious flavor, different from that of any existing fruit. Occasionally

our repasts were varied by a dish at which the cook excelled—a hare stew, simmered for hours over a slow fire. Those varying hares were easy to catch, and a couple of salmon line snares set in a runway at sundown usually captured at least one during the night. They were very abundant on the smaller barrens, where thick cover afforded good protection, but alas! so, too, were the lynxes, or "links," as the word stands in the Newfoundland vernacular, and only too often we saw the result of a sad woodland tragedy, the remains of a poor bunny surrounded by the tracks of some prowling feline marauder. A fat young hare makes a very appetizing meal for a hungry man, but three of the five which William served up from time to time were old bucks, and an old buck possesses about as much flavor as a dry birch chip.

There is one dish, however, at which the Newfoundlanders are an expert hand, and that is baking "skiver" bread. It is his favorite way of cooking it; a method so simple and yet so well adapted to practical use that I will explain it in detail. A hard wood limb two feet long and some three inches in diameter is shaved down on each side until it looks like the blade of a short double-edged broadsword. This is accordingly sharpened at each end, one of which is stuck in the ground at the proper distance from a bed of glowing embers, and then the "skiver" is complete. Your dough is ready on a piece of clean birch bark. It is rolled out into a long, thin loaf, then stretched further out until it looks not unlike a white cotton rope, and finally is wound spirally around the stick in a single layer, the edges being allowed to overlap. Now your bread is ready for the fire, and during the next twenty minutes the position of the stick should be changed several times to insure against burning, until the latter is finally drawn forth and the baking is completed. It is a queer, misshapen loaf, the one that you hold in your hand, not unlike a laterally compressed cornucopia, or perhaps it might be termed a scabbard of bread; but it tastes good, and the long pocket-like interior may be filled with meat or jam, thus forming a very convenient and serviceable sandwich.

The fifth day of my stay at the fall commenced with a light drizzling rain. It augured well for future good luck, for at that time the river contained little more than a foot of water, and in many places merely trickled down between the stones. For over a month I had waited and hoped in vain for the arrival of a really decent rain—for a shower, a thunderstorm—anything, in fact, that would rile the water and raise it sufficiently to bring the salmon, scattered over a stretch of thirty miles, to their final destination. And I was not alone in my hopes and disappointments, for during July there were many anglers in Newfoundland who could tell a similar tale—a tale of glaring sunlight shining down on clear, glassy pools, filled with fish absolutely indifferent to the fly. But at last a real storm was approaching. William had predicted one regularly every day for a month, and Jim "knewed it wuz a-comin' fur more'n a fortnight past."

Soon heavier raindrops were pelting the sides of my tent. The breeze freshened, it shifted to the east, and black clouds rolled in over the sky. All day great gusts of wind swept the open barrens in a constantly increasing gale, which shrieked through the walls of the narrow cañon, sending spruces and great branches crashing down the torrent and over the rocks. The water was rising rapidly above. The river was coming up to meet it as swiftly from below. By evening the sound of the falls had changed to a thundering roar, silencing our voices, as spray and foam and branches swept over the brink and down into the pool below. It was a terrible night, that—terrible for the little people of the woods. Beavers and muskrats were flooded from their burrows, and the young song sparrows in their nest by the river bank were washed down along with the debris. It was bad for the tired fish, slowly working their way up stream, to be caught in a shallow pool, and worse for the brood of half-grown shelldrakes that lived in the calm water below the rapids. But my salmon were safe; far down in the deep pool below, twenty feet beneath the turmoil on the surface, they sensibly hugged bottom, waiting for wind and water to subside. For two days the rain poured down steadily; every puddle became a pond, and every rivulet a rushing torrent. My little bridge of spruce trunks was eighteen inches below the surface. Even our familiar friends, the jays, had quite deserted our camp. Not until evening of the third day did the water commence to subside. On the morning of the fourth day I stood again on my rock, and cast out into the dark turbulent flood below. The river had fallen nearly a foot, but the wind still blew from the east, and all efforts to obtain a rise were in vain.

Early on Friday the sun once again peeped in at the tent's flap, and the top of my bridge appeared high and dry above the current of the brook. It was to be my last day at the falls, and it was with mixed feelings of hope and uncertainty that I again took my stand by the big boulder and peered over its edge for a last look. What a sight awaited me! At last the salmon had come; not the meager store of fish I had watched so often, but dozens of brown backs close together, arranged in serried ranks. Rocks on the bottom of the pool were obscured by them, large and small alike, little three-pound grilse, and great heavy spawners, some bruised and battered by the rocks, others marked by a white line back of the head where they had struggled in the meshes of the nets. I watched them for some time in silence, without making a cast. One especially interested me. We were already old friends. It was the same fish which had baffled all my efforts a fortnight before, twenty miles nearer the ocean, for he had the same crescent-shaped gash on his back. What a wonderfully powerful instinct it must be that drives the salmon, with little or no sustenance, so many miles, by so many perils, up such a dangerous pathway; but here they all were, at last safely harbored at the end of their journey. Soon several of the fish became restless, and one slowly rising to the surface circled lazily about among the eddies. Then I knew that he was mine, and hardly five minutes had elapsed before the reel hummed merrily as he coursed up and down the pool fast to a Jock-Scott. It was not a gamy fish, probably still tired from the arduous swim up stream, and in thirty minutes eight pounds of fat flesh were strung upon the scaffold in the smoke-house, drying for future use.

The sun was now well up and at least twenty salmon some inches below the surface swung around and around in the swirl. Two were hooked in quick succession, but

were allowed to escape the gaff, as they were only grilse of light weight. Still the endless procession continued at the head of the pool. The fish were becoming restless, and hardly a minute passed when one or more did not venture a leap out into the fall. Another of nine pounds was landed; an eight-pounder, aided by the current, fought for forty-three minutes before he finally succumbed to the gaff, and still a third ran my line clear to the end and escaped with that faithful little Jock-Scott which had landed eleven salmon. It was impossible to follow a fish if he chose to run down stream, as my ledge was narrow and only about five yards long. Leaning out as far over the brink as I dared, a good strong pressure on the rod usually turned a retreating salmon before he reached the end of my hundred yards of line, but not always, for, although the majority preferred to fight it out in the deep water of the pool, occasionally one would tear down stream toward the shallows, break my leader, and escape.

Again and again I cast a well-frayed silver-doctor far out from the rocky wall, but the salmon were evidently frightened, as they had vanished from the surface. Gradually increasing the length of my cast, a good seventy feet of line were soon flying well over toward the opposite shore; when suddenly, with a mighty upward rush a great silvery bar vaulted into the air and crossed the stream with one succession of mad leaps. This was no grilse or youngster, but the very master of the pool himself. Soon he became sulky, and resorted to that old trick known so well and used so frequently by salmon when hooked in swift water, and for full twenty minutes allowed the current to press his body against the surface of a perpendicular rock. But a few well aimed stones aroused him from his reveries, and then, back and forth, up and down, for half an hour more. It was certainly the best fish of the season, and the gamiest salmon of the year. But he was tiring slowly, very slowly, and already the broad tail flapped spasmodically and his high dorsal fin rose clear above the surface. William stood ready, gaff in hand; by a dexterous movement he drove it through the shining body, and with a broad grin and a joyous shout held it up for my inspection, calling at the same time, "Good fish, sir; you have great pleasure today." But alas! it was too late. One glance was enough. It was the big salmon, my old companion of the Black Pool. The scar on his back stood out more vividly than ever, and his glassy eyes stared at me almost reproachfully as he hung limp and motionless from the hook of the gaff. To voluntarily come so far, to escape successfully the dangers of the nets, to travel through so many perils, and that with a ghastly spear wound, and then to fight so bravely all in vain, seemed like a hard fate indeed for the noble fish.

The fishing was over and we had enough. I reeled up my line, recrossed the narrow bridge, and when dinner came had little appetite for my old friend of the early summer. So we buried him untouched, far from his home in the sea, under a boulder by the side of the river, where rocky walls stand as monuments, and the music of the waters is never silent. That was the last cast made at the falls, for leaves were turning, and the birds were starting southward, and caribou stags with full-grown antlers were waiting further back among the hills.

We had followed the salmon all the way up from the ocean; had watched him in fair weather and in foul, through bad luck and good. We had seen him gradually change from a plump, fresh-run fish to a thin but powerful fighter, and from a brilliant silver to a dark burnished gold; and now we leave him at the end of his journey, still strong and active—the king of American river fishes.

WM. ARTHUR BABSON.

[TO BE CONTINUED.]

Natural History.

English Skylarks at Rugby, L. I.

WHERE the rush of a breeze sets the meadow grass a-quiver, where the daisies and brown-eyed Susans dodge and dance and hide their bright faces among the nodding heads of timothy and clover—there I find the skylarks. These charming songsters have established a colony in the vicinity of Flatbush, and surely this little Britisher's love of mother country has influenced his choice of locality, for the place is known as Rugby.

Strolling knee-deep through a waving sea of grass, I note the scattered blooms of familiar wild flowers—butter-and-eggs, wild carrot, buttercup, aster, and, skirting the borders of every field, now in long lush beds, now in irregular clumps, the sweet clover, so dear to colonial housewives, bows and bends under the caress of the soft airs that carry its fragrance far and near.

As I pause in my slow pacing to look about, and absorb the quiet beauty of my surroundings, there is a quick flutter of little wings, as, with a burst of song, a small, dun-colored bird flushes within a few yards of where I stand. For fifty feet or so he mounts almost perpendicularly, then, facing the breeze, up, up, up, he goes, in a succession of short flutterings, till at about 300 feet above me he hovers sparrow-hawk fashion, the while he pours out his little soul in rapturous song. Not for an instant from his first spring into flight has his music ceased, and still, as he poises on trembling wings, the notes gush from his swelling throat in ecstasy, a medley of musical clippings that seem to crowd each other for utterance. After a minute or so of this musical delirium, there appears to ensue a calmer mood, and I notice the song pulsates with a richer, more flute-like quality; there is a mellowness now that was lacking at first. Presently the trembling wings are still and rigid, held at their full extent, the small tail, with its white feather at either side, is spread like a miniature fan, and slowly the little fellow floats down among the waving grass, his music ceasing the instant he reaches its cover.

I have observed altogether some thirty of these soaring larks, and in no instance did I see the spiral ascent made. This may be owing to the fact that on every visit I made with them there was a fresh breeze blowing. Invariably the birds went almost straight into the air for the first fifty feet, then in a long swinging slant till the desired elevation was attained. In their descent they appeared an

exact facsimile of the little Japanese bird kites, so popular with us a few years past. I presume the spiral ascent we read of in the English prints is made in calm weather, hence I failed to observe it.

The above description is the usual procedure of the skylark when soaring in song, though now and again the descent is more rapid, till, within forty or fifty feet of the meadow, the bird will fold its wings close, and drop like a plummet, swiftly and silently from sight, in the grass.

While on the ground in the thick cover of the fields, the skylark has a little song that begins exactly like that of our dainty white-throat sparrow. Tu! tu! tu! it rings out over the meadows, and involuntarily you listen for the well known white-throat refrain after the first three notes that rise in the scale in precisely similar pitch and fashion, but no, a rapidly uttered weet! weet! weet! weet! succeeds. Where several of the larks are near-by, this little song, or rather call—for it seems to voice an inquiry—is frequently repeated, and should you have the good fortune to see the lark as he stands upon a clod of earth, or in a semi-open space where the grass is thinned out, you will notice a pause after the last weet, as though he awaited a reply. Occasionally he will repeat this call before running off on his restless search for food among the grass stalks. Should you chance upon him perched atop of a fence post, or on some low bush, you may see him throw back his head, as though to fix his eyes on the heavens, and while the little throat swells to the music in his heart, you hear tu-tu-tu-trrrrrr-tweet, tweet, tweet, tit, tit, tit, we, we, wee-al! wee-al! wee-eee! I have heard this sung by several individuals, always as given above. Over and over again it is repeated for minutes at a time; then a swift plunge to the grass and silence, till again the little call—tu, tu, tu, weet, weet, weet, weet. Of course the reader must realize the impossibility of properly rendering bird songs into words, but the above description will give a fair idea—a fair phonetic idea—of the skylark's varied music, apart from his soaring song, which is for me perfectly impossible to describe in words that will convey any just conception of its varied sweetness. The exquisite soaring song is continuous; seemingly the bird never pauses for breath till he returns to earth again. I timed one individual who was in the air for five and one-half minutes, and he sang continuously during the whole of his trip aloft.

Since it consorts with our own beloved meadowlark, hobnobbing day by day with the ubiquitous teeter snipe that nest near-by, it is not at all surprising that one should recognize their familiar notes in the repertoire of this unique and inimitable though tiny songster. I use the word tiny advisedly, for though nearly similar in size with our song sparrow, still it is a tiny frame to carry such a flood of melody as the skylark pours forth. Such a sweet jumble of familiar bird songs as he utters would seem to indicate a retentive memory, and considerable power of mimicry. He seems to be telling all he knows up there in the blue sky, and surely the billowy white clouds that sail over him must catch the echo of his song. One thing is certain, he only tells pleasant things; his sweet notes are sufficient evidence of this. WILMOT TOWNSEND.

Rugby is a part of Brooklyn. Mr. Townsend sends these specific directions for going to hear the skylarks: Take Church avenue car to Rugby. Get off at East 92d street and walk east. I found the skylark in greater numbers between East 92d and East 95th streets and Avenues A and J. The avenues run north and south, and the streets east and west, and while the birds may be found scattered about in the immediate area, they seemed to show up about twice the number in the localities I give above.

Fish that have Voices.

IN "At Last," the ever-entertaining story of his visit to the West Indies, Charles Kingsley writes of the unusual fishes of the Island of Trinidad:

Our night, as often happens in the tropics, was not altogether undisturbed; for shortly after I had become unconscious of the chorus of toads and cicadas, my hammock came down by the head. Then I was woke by a sudden bark close outside, exactly like that of a clucking fox; but as the dogs did not reply or give chase, I presumed it to be the cry of a bird, possibly a little owl. Next there rushed down the mountain a storm of wind and rain, which made the cocoa leaves flap and creak and rattle against the gable of the house, and set every door and window banging, till they were caught and brought to reason. And between the howls of the wind I became aware of a strange noise from seaward—a booming, or rather humming, most like that which a locomotive sometimes makes when blowing off steam. It was faint and distant, but deep and strong enough to set one guessing its cause. The sea beating into caves seemed, at first, the simplest answer. But the water was so still on our side of the island that I could barely hear the lap of the ripple on the shingle twenty yards off, and the nearest surf was a mile or two away, over a mountain a thousand feet high. So puzzling vainly, I fell asleep, to awake, in the gray dawn, to the prettiest idyllic picture, through the half-open door, of two kids dancing on a stone at the foot of a coconut tree, with a background of sea and dark rocks.

As we went to bathe we heard again, in perfect calm, the same mysterious booming sound, and were assured by those who ought to have known, that it came from under the water, and was most probably made by none other than the famous musical or drum fish, of whom one had heard, and hardly believed, much in past years.

Mr. Joseph, author of the "History of Trinidad," from which I have so often quoted, reports that the first time he heard this singular fish was on board a schooner at anchor off Chaguaramas.

"Immediately under the vessel I heard a deep and not unpleasant sound, similar to those one might imagine to proceed from a thousand Æolian harps; this ceased, and deep twanging notes succeeded; these gradually swelled into an uninterrupted stream of singular sounds like the booming of a number of Chinese gongs under the water; to these succeeded notes that had a faint resemblance to a wild chorus of a hundred human voices singing out of tune in deep bass."

"In White's 'Voyage to Cochin China,' adds Mr. Joseph, 'there is as good a description of this, or a similar submarine concert, as mere words can convey;

this the voyager heard in the Eastern seas. He was told the singers were a flat kind of fish; he, however, did not see them. 'Might not this fish,' he asks, 'or one resembling it in vocal qualities, have given rise to the fable of the sirens?'"

It might, certainly, if the fact be true. Moreover, Mr. Joseph does not seem to be aware that the old Spanish Conquistadores had a myth that music was to be heard in this very Gulf of Paria, and that at certain seasons the nymphs and tritons assembled therein, and with ravishing strains sang their watery loves. The story of the music has been usually treated as a mere sailor's fable, and the sirens and tritons supposed to be mere stupid manatis, or sea-cows, coming in as they do still now and then to browse on mangrove shoots and turtle-grass; but if the story of the music be true, the myth may have had a double root.

Meanwhile, I see Hardwicke's "Science Gossip" for March gives an extract from a letter of M. O. de Thoron, communicated by him to the Académie des Sciences, December, 1861, which confirms Mr. Joseph's story. He asserts that in the Bay of Pailon, in Esmeraldas, Ecuador, i. e., on the Pacific Coast, and also up more than one of the rivers, he has heard a similar sound, attributed by the natives to a fish which they call "the siren" or "musico." At first, he says, he thought it was produced by a fly or hornet of extraordinary size; but afterward, having advanced a little further, he heard a multitude of different voices, which harmonized together, imitating a church organ to great perfection. The good people of Trinidad believe that the fish which makes this noise is the trumpet fish or fistularia—a beast strange enough in shape to be credited with strange actions; but ichthyologists say positively no; that the noise (at least along the coast of the United States) is made by a pogonias, a fish somewhat like a great bearded perch, and cousin of the maigre of the Mediterranean, which is accused of making a similar purring or grunting noise, which can be heard from a depth of one hundred and twenty feet, and guides the fishermen to their whereabouts.

How the noise is made is a question. Cuvier was of opinion that it was made by the air-bladder, though he could not explain how; but the truth, if truth it be, seems stranger still. These fish, it seems, have strong bony palates and throat teeth for crushing shells and crabs, and make this wonderful noise simply by grinding their teeth together.

I vouch for nothing, save that I heard this strange humming more than once. As for the cause of it, I can only say, as was said of yore, that "I hold it for rashness to determine aught amid such fertility of nature's wonders."

From the Literary Digest.

FISHES are not generally credited with the power of vocal utterance, but there is plenty of evidence to show that some of them can make noises, musical or otherwise, that presumably come from the mouth, although the source and manner of production of the sounds appears, in most cases, never to have been investigated scientifically. In La Nature (Paris, May 14), M. Henri Coupin gives us some of this evidence, much of which comes from travelers of repute. He says:

"The expression 'dumb as a fish' is not perfectly exact. Although it is true that the great majority of fish do not seek to enter into competition with operatic tenors, there are a few that can make sounds whose utility is not very well understood.

"Prayer relates that one night when he was on the Pontinac, the largest river on the west coast of Borneo, he heard very distinct music, sometimes low, sometimes high, sometimes distant, sometimes near. It came from the depths like the song of the sirens, sometimes resounding like a powerful organ, sometimes like a sweet and harmonious Æolian harp. A diver hears this music much more clearly and perceives that it comes from several distinct voices. This music, so the natives declare, is produced by fish.

"The same fact had already been told by Humboldt. 'Being,' he says, 'in the South Sea, about seven o'clock in the evening, the whole party was frightened by an extraordinary noise that resembled the beating of drums in the open air. It was at first thought that this noise was produced by the wind, but soon it was heard clearly alongside the ship, chiefly forward. It resembled the noise of boiling water, when the bubbles burst. Then it was feared that the ship had sprung a leak, but the noise extended successively to all parts of the vessel, and about 9 P. M. it ceased entirely.'

"Lieut. John White, of the United States Navy, reports that when in the mouth of the Cambodia River he and his party heard extraordinary sounds around the ship. They were like a mixture of the bass notes of an organ, the ringing of bells, the guttural cries of a huge bullfrog, and noises that seemed to come from an enormous harp. They seemed to shake the very vessel. These noises increased, and finally formed a universal chorus on both sides of the ship and along its entire length. As the party ascended the river, the sounds weakened and then ceased entirely. The interpreter told them that the cause was a shoal of fish of flat oval form which had the power of adhering strongly to various bodies by the mouth.

"The Pogonias, or Drumfish, which inhabit the Atlantic Coast of the New World, also make noises that are often heard at great distances. * * * It is thought—but this is not certain—that the noise is produced by rubbing the pharyngeal teeth together.

"In the fresh water of the Rio Mataje and the Rio del Molino are found musical fish which, because of this peculiarity, are called by the natives by the name of 'musicos.' During an exploration in the Bay of Pailon, in the northern part of the republic of Ecuador, says M. Thoron, 'I skirted a shore at sunset. All at once a strange sound, extremely low and prolonged, was heard around me. I thought at first that it was an extraordinarily large insect or bee, but, seeing nothing, I asked of my oarsman whence the noise came. He answered that it was a fish that sang thus. Some call them sirens, and others musicos. Advancing a little further, I heard a multitude of different voices that imitated perfectly the lower and middle tones of a church organ, heard outside the building, as in the church porch. The concert began about sunset, and continued several hours, the executants not being

disturbed by the presence of men, but not showing themselves at the surface of the water.

"Another traveler, Le Mesle, describes a concert of singing fishes in his 'Journey to Cambodia.' 'Each one of the executants,' he says, 'emits, as in Russian music, only a single note—full, long, and grave—a sound like that of an ophicleide. These make up a most extraordinary ensemble; each executant plays a unique air in a different key. The tones arise everywhere—before, behind, in the boat, and the water in which they are produced gives them a peculiar quality of tone. The author of this melancholy melody is a fish with a large, flat head * * * reaching sometimes 1 to 1½ meters in length. The natives call it Machovian. It is greenish, spotted, with silvery belly, and has short antennae on the snout.'

"We also have a talking-fish—the *grondin* [red gurnet], well known to naturalists as having a sort of feet, and to cooks as excellent eating. When it is taken from the water, it makes a noise more or less loud, which has given it its name [from the French *gronder*, to growl or snarl]. This sound is certainly produced by the passage of the gas from the swimming-bladder, which the fish can compress at will. 'A learned Marseilles naturalist,' says H. E. Sauvage, 'conceived the idea of profiting by this aptitude of singing-fish, and he placed at the bottom of the water, in captivity in nets, male gurnets for the purpose of attracting fishes of the opposite sex. * * * The attempt was reasonably successful, but it requires much patience, and this kind of fishing would probably suit only a small number of amateurs.'

"Several other kinds of fish are able to sing, but their identity is not certain in many cases. The *dorée* [John Dory], or fish of St. Peter, manifests its presence at low tide by a sort of clucking that has given it the name of 'water-chicken.' A *baliste* [trigger-fish] gives out plaintive and melancholy sounds, like the creaking of a wagon wheel. A *pristipome* imitates exactly the quack of a duck. Even the tunny can thrust its head out of water and sing in a voice that recalls a crying infant."

The Frog's Provender.

NEW YORK, July 11.—*Editor Forest and Stream:* I am glad to follow Dr. Piatt's injunction to rise up and testify in the matter of the food devoured by frogs. My remarks will not be long, but I trust they will be to the point.

Many years ago when collecting birds in southern New England, I shot on the salt marshes a swallow, which fell

in a shallow pool in the marsh. My brother, who happened to be standing near the pool, saw the bird fall, and saw a huge bullfrog make two or three sprawling leaps over the mud and through the water, and swallow the bird. When I came up, the head of the bullfrog still remained above water with the wings of the swallow sticking out of the corners of his mouth.

Recently a story was told me by a friend who resides at Flushing L. I., of certain happenings on a neighbor's place.

This neighbor has some water inclosed, in which he keeps some domesticated wildfowl, and not long ago the opportunity occurring to purchase five gigantic bullfrogs, he introduced them into the water.

This spring, as it seemed a possibility that some of his wild duck could breed, an effort was made to get rid of the frogs, for fear they might injure the ducklings, and three of them were killed, but the other two could not be found. Some time in May a female pintail duck came off with three young ones, which after two or three days disappeared, and were not seen again. A day or two after their disappearance, the missing bullfrogs were seen and killed and in their stomachs were found the remains of the little pintails. I fancy that there is nothing living that a bullfrog will not eat.

G. B. G.

The Zoological Society's New Mammals.

It may not be generally known that at the New York Zoological Park there are a pair of European bison purchased from the Prince of Plees, having been bred in his forest in Silesia.

These animals are about five years old, and are doing well. They are believed to be the first of the kind ever received in America.

The Aquarium has recently received a pair of manatees from Lake Worth, Fla. The larger of the two is 3½ feet long. This is larger than the one which died at the Aquarium a few months ago.

The fine lioness Cleopatra recently gave birth to a litter of cubs, the number of which is not as yet known. It is thought that there are at least three, and perhaps more. Cleopatra is the mother of another fine litter of young lions now almost half grown. Lion breeding promises to be an industry of some importance at the New York Zoological Park, where, if we recollect aright, there are now eight young lions, all strong and healthy, and about the size of a good big St. Bernard dog.

Frog's Food, Suspended Animation.

BUFFALO, N. Y., July 10.—*Editor Forest and Stream:* The two articles, "The Frog's Provender," by Dr. Piatt, and "Suspended Animation," by Charles Cristadoro, remind me of two incidents coming under these head lines. The first happened when I was a boy, on the Indian River, this State. I was making a collection of birds, and one day my brother shot a spotted sandpiper from the boat; it fell into the water and before we could get to it a large bullfrog had swallowed all but part of one wing, and was making frantic efforts to get under water with it, but was easily captured, and the frog's legs were eaten.

Mr. Cristadoro is not the only one who has been laughed at for telling frozen fish stories, but I keep on telling mine, and here it goes again: Two years ago last winter I walked down to the lake shore one noon and bought a string of blue pike from one of the many fishermen coming in from out on the ice, where they make their living during the time the lake is frozen over. I took these fish, which were frozen hard, to my office, and put them out on the window sill. At night when I went home they were put in water to thaw out, and in a few minutes showed unmistakable signs of life. I think they would have lived had they had sufficient quantity of water.

WILFRED P. DAVISON.

Bird Notes from the Zoological Park.

ORNITHOLOGISTS will be interested in the contributions to the last Zoological Bulletin—July, 1904—by Mr. C. William Beebe, Curator of Birds in the Society's park. Mr. Beebe has this year found breeding in the park Lawrence's warbler (*Helminthophila lawrencei*, Herrick), of which only twelve specimens have been recorded. This is the first instance known of the breeding of this species.

Mr. Beebe also gives a very interesting illustrated article on the hatching and rearing of certain sea birds. Having brought back from the Virginia coast some eggs to be used in the study of embryology, Mr. Beebe finding on his arrival that the eggs were still alive, put them in an incubator, where they hatched. These birds were common tern, black skimmer, laughing gull and green heron. The detail of Mr. Beebe's observation is well worth reading.

All communications for FOREST AND STREAM must be directed to Forest and Stream Pub. Co., New York, to receive attention. We have no other office.

American Big Game in its Haunts.*

THE Boone and Crockett Club is an organization well known to most sportsmen, and this book is the fourth of its important publications. The three others—"American Big-Game Hunting," "Hunting in Many Lands," and "Trail and Camp-Fire"—have all appeared within the last ten or twelve years, and have had a wide currency, not only among big-game hunters, but also among foresters, and generally among those persons who are interested in making the wisest use of the natural products that our country affords.

The Boone and Crockett Club has had a creditable share in many worthy operations that have taken place since its founding. Largely through the influence of its members an efficient law was passed governing the Yellowstone Park. It has had not a little to do with the growth of a wholesome public sentiment in the United States with regard to the forest preservation and planting, and one of its members has long been United States Forester. It had much to do with bringing into existence the New York Zoological Society, and practically everything to do with the growth and influence of that Society, which now operates what is probably the finest zoological park in the world, as well as the New York Aquarium.

The Boone and Crockett Club was founded in December, 1887, Mr. Theodore Roosevelt having suggested the idea of a club of big-game hunters at a dinner given to a few friends in his New York home in December of that year. Since the club began the publication of its books, he has been on the editorial committee, and it is only from this volume that his name has been omitted as one of the editors. It is fitting, then, that this fourth volume of the Club's publications should open with a sketch of the President—so brief that it is little more than a catalogue of the things that he has done, without any comment on them. The frontispiece of the volume is the best photograph of the President that we have seen.

The opening sketch is followed by a splendid account from the President's own pen of his trip in the spring of 1903 to certain "Wilderness Reserves," of which he writes. Of these, the Yellowstone National Park is by far the most important, because of its great size, and because for a number of years it has been efficiently protected against poachers by the United States troops. "The Park is an object lesson showing very clearly what complete game pro-

tection will do to perpetuate species, and Mr. Roosevelt's account of what he has seen there is so convincing that all who read it and appreciate the importance of preserving our large mammals must become advocates of the forest reserve game refuge system." Mr. Roosevelt's article is full of spirit and feeling, and he throws himself into the scenes which surround him in these reserves with the same earnestness and energy that mark all his actions. His chapters are very fully illustrated with photographs of bears and sheep and elk and antelope and deers and bison and small birds—pictures which might well make Mr. Wailian sigh with envy. The closing paragraph of the article is an earnest plea for game protection—as good a one as perhaps was ever written: "Surely our people do not understand even yet the rich heritage that is theirs. There can be nothing more beautiful than the Yosemite, its groves of giant sequoias and redwoods, the cañon of the Colorado, the cañon of the Yellowstone, the three Tetons; and the representatives of the people should see to it that they are preserved for the people forever, with their majestic beauty all unmarred."

In a very entertaining chapter on the "Zoology of North American Big Game," Mr. Arthur Erwin Brown, eminent as a zoologist, and well known as the secretary of the Philadelphia Zoological Society, answers the question, "What is the difference between the bison and the buffalo, and which is the American animal?" and in doing so gives us a very full, and at the same time simple, statement as to the relationships of most species of North American big game. The paper is full of information which to most of us is absolutely new, but its perusal will give the reader a clear view of the salient characteristics of these North American species, with many suggestions as to where they came from.

Under the general head, "Big-Game Shooting in Alaska," Mr. James H. Kidder has written five very interesting chapters, many of them abounding in thrilling adventure, which will delight the heart of the big-game hunter. He tells of "Bear Hunting on Kadiak Island," "Bear Hunting on the Alaska Peninsula," "My Big Bear of Shuyak," "The White Sheep of Kenai Peninsula," and "Hunting the Giant Moose." Nor does Mr. Kidder tell us merely of hunting, for in reading his fascinating pages we learn much of the life in the far north, its hardships, and its pleasures. This is one of the things that came under Mr. Kidder's observation:

"The bear had fed well out into the meadow, not far from a small clump of trees. In order to reach this clump of trees, Blake and Ivan were obliged to wade quite a deep stream and had removed their clothes. Unfortunately, my friend carelessly left his coat, in the pocket of

which was all the extra cartridges of his and Ivan's rifles.

"I saw them reach the clump of trees and then turned the glasses on the bear. At the first shot he sprang back in surprise, while Blake's bullet went high. The bear now located the shot, and began a quick retreat to the woods, when one of my friend's bullets struck him, rolling him over. He instantly regained his feet, and continued making for cover, walking slowly and looking back over his shoulder all the while. Blake now fired another shot, and again the bear was apparently badly hit. He moved at such a slow pace that I thought he had surely received a mortal wound.

"Entirely against orders, Ivan now shot three times in quick succession, hitting the bear with one shot in the hind leg, his other shots being misses. Blake now rushed after the bear with his hunter following some fifty yards behind, and approached to within ten steps, when he fired his last cartridge, hitting the bear hard. The bear fell upon its head, but once more regaining its feet, continued toward the woods. At this point Ivan fired his last cartridge, but missed. The bear continued for several steps, while the two hunters stood with empty rifles watching. Suddenly, quick as a flash, he swung around upon his hind legs and gave one spring after Blake, who, not understanding his Aleut's shouts not to run, started across the marsh with the bear in close pursuit. At every step the bear was gaining, and Ivan, appreciating that unless the bear's attention was distracted, my friend would soon be pulled down, began waving his arms and shouting at the top of his voice, in order to attract the bear's attention from Blake. The latter saw that his hunter was standing firm, and taking in the situation, suddenly stopped. The bear charged to within a few feet of the two men, but when he saw their determined stand, paused, and swinging his head from side to side, watched them for some seconds, apparently undecided whether to charge home or leave them. Then he turned, and looking back over his shoulder, made slowly for the woods.

"This bear while charging had his head stretched forward, ears flat, and teeth clinched, with his lips drawn well back and his eyes glaring. I am convinced that it was only Ivan's great presence of mind which prevented a most serious accident."

Dr. W. Lord Smith's contribution to this book treats also of Alaska, for he writes of "The Kadiak Bear and its Home."

Mr. George Bird Grinnell contributes a generous chapter on the "Mountain Sheep and Its Range," Mr. Henry Fairfield Osborn one on the "Preservation of Our Wild Animals," recently published in the FOREST AND STREAM; while Mr. Madison Grant, secretary alike of the Zoologi-

*American Big Game in its Haunts. The Book of the Boone and Crockett Club. Editor, George Bird Grinnell. New York: Forest and Stream Publishing Co. Cloth, illustrated, pp. 497. Price, \$2.50.

cal Society and of the Boone and Crockett Club, has an interesting chapter on the "Distribution of the Moose." Mr. Alden Sampson, who last year was sent to the Pacific Coast as the game preserve expert of the Biological Survey, reports on the general subject of creating game refuges, describes much of the country passed through, and gives his views as to how these refuges should be established.

Brief memoranda by Paul J. Dashiell, and by Mr. John H. Prentice, describe illustrations from Canada and India.

Editorial articles treat of "Big-Game Refuges," "The Forest Reserves of North America"—not merely of the United States, but of Canada as well—and in an appendix is given a report by Mr. E. W. Nelson, of the Biological Survey, who was asked by the Club to report on the Black Mesa Forest Reserve, and its Availability as a Game Preserve. This report deserves especial mention as being a model of what such a report should be.

The usual Constitution and By-laws, and list of officers and members of the Boone and Crockett Club close the volume.

There are forty-six illustrations, and it is perhaps not too much to say that there never has appeared a volume so completely and beautifully illustrated with types of game covering so wide a range, and in view of the size and beauty of the volume, we shall be surprised if it does not have a very wide circulation.

Squirrel Barkers and Myth Busters.

Editor *Forest and Stream*:

Steam, electricity, X-rays, and other concomitants of modern life and progress, do not have the effect of strengthening our faith in the beliefs of earlier times. The iconoclast has long been abroad in the land; he has shattered the hoopsnake, and permanently knocked the apple off the head of William Tell's small boy; aided by women's craze for wearing feathers—which has destroyed most of the eagles in the land—he has shown that these rapacious birds no longer carry off children playing in the dooryards of their mountain homes. The packs of wolves which in our childish days constantly swept over the frozen steppes of Russia in the wake of sledges loaded with large families of small children, which one by one were dropped overboard to delay the ravaging horde, no longer exist. No subject is sacred to the myth buster, and—what is worse—he finds people who listen to, and papers which print, the arguments that he writes, proving—at least to his own satisfaction—that some venerable tradition in which we have always had implicit faith is without foundation. He might be called a trust buster instead of a myth buster, for he takes away our trust in things long revered as true.

For near a hundred years the American people have believed that the old-time riflemen of the South and West were great shots, and that among the feats which they used to perform with that arm was "barking" squirrels. The squirrel is a small animal; the rifle ball, with its rotary motion and great speed, necessarily tears a large hole. A squirrel hit in the body with a rifle ball would be ruined for eating.

Recently an anonymous myth buster has bobbed up to the surface, and in the columns of the *New York Evening Post* denies in substance that this practice of squirrel-barking ever existed.

Somewhere the myth buster has come across a quotation from Audubon's vivid sketch of "Kentucky Sports," published originally in the "Ornithological Biographies," and quotes it as follows:

"I first witnessed this manner of procuring squirrels while near the town of Frankfort, Kentucky. The performer was the celebrated Daniel Boone. We walked out together and followed the rocky margins of the Kentucky River, until we reached a piece of flat land, thickly covered with black walnuts, oaks, and hickories. As the general mast was a very good one that year, squirrels were seen gamboling on every tree around us. Boone pointed to one of the animals, which had observed us, and was crouched on a branch about fifty paces distant, and bade me mark well where the ball should hit. He raised his piece gradually until the bead or sight of the barrel was brought in a line with the spot he intended to hit. The whip-like report resounded through the woods and along the hills in repeated echoes. Judge of my surprise when I perceived that the ball had hit the piece of bark immediately underneath the squirrel, and shivered it into splinters, the concussion produced by which had killed the animal and sent it whirling through the air, as if it had been blown up by the explosion of a powder magazine. Boone kept up his firing, and before many hours had elapsed he had procured as many squirrels as he wished. Since that first interview with the veteran Boone I have seen many other individuals perform the same feat."

Apparently this myth buster has never heard of "Audubon the naturalist"—the American woodsman, the great student and painter of American birds—or if he has heard the name, he is wholly unfamiliar with his writings. He speaks of Audubon as "an unnamed writer," and denounces his account as "a flawless finished fib." Yet for more than two generations scientific men in every land have accepted the observations of Audubon the naturalist as absolutely trustworthy, and it remains for this anonymous person, who knows so little of his subject that he cannot name the author of one of the best accounts of it, to attempt to throw doubt on the writings of a great man.

In order to satisfy himself that squirrels could not be "barked," the myth buster started out with an old Winchester .44-40 to try to do it himself, and this is what happened:

"My first subject was a gray squirrel lying along the limb of a California oak. My weapon carried the old Winchester .44-40 cartridge, containing a heavier bullet and more powerful charge of powder than Daniel Boone used in his Kentucky rifle. The shock imparted by the .44 would be many times greater than that given by the small-bore projectile of the earlier day. The distance was less than ten yards, and therefore no remarkable skill was required to place the bullet where I wanted it. I took very careful aim, and when I fired the bullet carried away a piece of bark from under the squirrel's belly, and plowed a furrow across the limb without touching the fur.

"Did the squirrel go whirling into the air? Not any. He uttered a startled squeak and ran a few feet further along the limb. The next time I knocked the bark from under his forefeet to give him the full benefit of the shock, whereupon he whisked to another limb and began scolding at me for disturbing him. The third shot was aimed to strike under his hind feet, but the bullet glanced a trifle and passed through a leg, and then, of course, I had to kill the squirrel.

"First I put a .44 bullet through the animal's body. He went up into a crotch and showed only a part of his head, and the next shot carried away the front of his skull and a part of his brains. He ran up to one of the higher limbs and out to the very end, where he clung, chattering and bleeding, in such a position that I could not get a shot at him until I drove him back by throwing clods and sticks into the tree. The squirrel made his way back along the limb and down the trunk to the ground, where I had to finish him with a stick.

"Subsequent experiments in the same line were invariably failures, and I never have found a truthful man who would say that he ever performed or saw anyone perform the Daniel Boone feat successfully."

Certainly our myth buster has demonstrated beyond any question that "barking" squirrels is something that he could not do. It would seem also as if he had drawn somewhat on his imagination. The average rifleman would say that a .44 caliber rifle bullet put through a squirrel's body would cut the squirrel in two, and the divided fragments would not be able to run actively about a tree, to be shot at a few times more, and then to be driven out of the tree with sticks and stones, and finally to be pounded to death on the ground with a club. No, this myth buster could not "bark" squirrels, and not being able to do it himself, ponderously declares that no one else can. But what about those men of ancient days who used the long rifle, and who, we are told, drove nails and snuffed candles, as well as "barked" squirrels. Did they do it, or did they not? I believe that they did.

Surely it is not yet too late now to learn something about the practice. If it has entirely passed out of use, there must still be some who have done it, or have seen it done, or whose fathers have told them about doing it. Have your readers any knowledge of this matter? Surely down in the Southwest there must be men who know something about it. Let us hear from them.

RIFLEMAN.

New York Cold Storage Case.

WYMORE, Nebraska, June 30.—*Editor Forest and Stream*: I have read with interest the majority opinion of the Appellate Division of the Supreme Court of New York, in the cold storage cases, as well as the dissenting opinion of Judge McLaughlin. As is usual in cases in which a dissenting opinion is filed, the best reasoning and the authorities sustain the dissenting opinion.

But I predict that the conclusions reached by the majority of the Appellate Division of the Supreme Court will be affirmed by the Court of Appeals.

In the first place, the majority opinion does not hold the statute unconstitutional. If I understand it, the court simply holds that it was not the intention of the Legislature to make game brought into the State at a time when it could be legally done, and which was kept in cold storage beyond that time, subject to the penalties of the statute. It was a question of construction of the statute only.

Where the punishment inflicted and the penalties attached, are so out of proportion to the magnitude of the offense, we may always expect the courts to so construe the law as to avoid the infliction of these unreasonable penalties. I have no doubt that if the infliction of these penalties could not be avoided in any other way, the Court of Appeals of the State of New York would hold the statute unconstitutional.

It is a very close question whether the State can by law say that the mere having in possession of game killed and purchased without the State and brought into the State at a time when it could be legally done, and kept in cold storage until after the open season, is a crime; and any law to that effect, having attached to it such penalties as are attached to the New York statute, will never be enforced by the courts, and the sooner those in favor of game protection by law find this out the better. We have had some legislation of that kind in this State. The Legislature of 1901, in amending the game law of this State, passed a law providing that when persons were found violating the game laws, or hunting or fishing without license or permit, that "all guns, ammunition, dogs, blinds, and decoys, and any and all fishing tackle, etc.," should be forfeited, taken and sold, etc. On April 21, this year, this section of the law was held unconstitutional by our Supreme Court.

In the Nebraska case it was held that this was depriving the individual of his property without due process of law, and while the principle involved in the two cases is not the same, I cite it to show with what jealous care the courts protect property rights.

No law, in my judgment, that goes further than to inflict a fine and costs, and a commitment until the fine and costs are paid, will ever be enforced to protect our game; and I am firmly of the opinion that the courts of last resort in all the States will uphold a statute so drawn.

A. D. McCANDLESS.

In Quebec.

MANSONVILLE, Quebec, July 5.—*Editor Forest and Stream*: We receive favorable reports from all through the country in this vicinity concerning the broods of young ruffed grouse. We have personally seen within the past few days young grouse that were over half grown. Deer are also seen every few days, sometimes quite near the farm buildings. Mink are very numerous along our trout streams; several of the farmer boys have the young that they are rearing for pets. Some good catches of trout have been made in this vicinity. Last evening we made a good catch, and had at least one that would tip the beam at the pound notch. Foxes are said to be scarce, but when the frosts arrive they will come down from the mountains and give sport to the boys who love to hunt them.

STANSTEAD.

The Proper Way to Cook a Loon.

URI LAMPREY is a mighty hunter, and although a good shot and generous with his birds, yet there were always more willing mouths open than there were birds in the bag to fill them. A persistent son of the old sod never gave Mr. Lamprey much peace because of his constant and persistent opportunity for "jist wan little woid duck."

So a pair of loons fell one day to Lamprey's gun, and he thought of the "illigant" loon stew Mike would be making with them. And Mike got them, and reported in due course.

"What the devil kind of ducks were them yez be after giving me? They tuk us—me and the missus—four days to pick the blathering birds. I think the fithers were glued to them, that I do. And the cooking of them! Mrs. Maloney said the best way to tinder a wild goose was to parboil it. And we've used up near a cord of wood a-bilin' of them, and if I didn't know that they once had fithers on their backs, I'd say they were made of mahogany, sure enough."

CHARLES CRISTADORO.

A Public Enemy.

"THERE is a great fascination in tracking and shooting big game, a fascination that wants a certain amount of checking, or the sportsman degenerates into a common butcher. Excessive slaughter is, in my opinion, one of the most selfish of crimes; for though man has an hereditary interest in the wild creatures of the world it is an entailed, not an absolute, interest, and it is his bounden duty to remember and guard the interests of his successors. He who exterminates all the game on an estate deprives his descendants of one of the chief pleasures of possession. On a private estate the mischief may not be irreparable; on a public one (the waste places of the world at large), it certainly is. Therefore, the man who would not be considered a public enemy ought to shoot, however remote the hunting ground, with moderation. There are others to come after him; and a world denuded of wild creatures would be a spoiled world."—Paul Fountain.

The Changed Village of the Plain.

Sweet Auburn! loveliest village of the plain,
Where simple peace and plenty used to reign,
I sought you out last week, with faith implicit
In your integrity to pay a visit,
To see those bowers of innocence and ease,
Seats of my youth, where I and Willie Green
Used play around when we were passing green,
Before these many years had come between.
How weary had I waited for the day
When city toil would let me break away
For long enough to be a boy once more!
That day has come and gone, and I am sore.

Along your streets the summer trolley heaves,
And copper wires have stripped your trees of leaves;
One only master dares to tread your grass—
The company supplying you with gas.
No more the gleaming brook reflects the sun;
Of factories I counted twenty-one,
That choke the stream with sewage to the brim
And foul the pool where none may longer swim.
Amid the lanes that sheltered me, a child,
The hollow-sounding auto rushes wild.
The street pianos play where bluebirds sang,
And hucksters' bells unmitigated clang.

Sweet smiling village! from your outskirts' hem
Your sports are not all fled. A pair of them
Came strolling up, with manner bold and free,
And tried to work a bunco game on me.
While there I stood, from sordid thoughts remote,
A politician tried to buy my vote;
And when my tavern bill I chanced to view
I knew no more till doctors brought me to.

Sweet, simple Auburn! in about an hour
I caught a train with all my might and power.
And when I think, within my city bound,
Of how much change the years have wrought around,
The memory turns me dizzy in the brain
And fills me with a sharp and shooting pain.
—Newark News.

Nessmuk.

I hail thee, Nessmuk, for the lofty tone,
Yet simple grace, that marks thy poetry!
True forester thou art, and still to be,
Even in happier fields than thou hast known.
Thus, in glad visions, glimpses am I shown
Of groves delectable—"preserves" for thee—
Tanged but by friends of thine—I name thee three:—
First, Chaucer, with his bald old pate, new-grown
With changeless laurel; next in Lincoln-green,
Gold-belted, bowed and bugled, Robin Hood;
And next, Ike Walton, patient and serene;
These three, O Nessmuk, gathered hunter-wise,
Are camped on hither slopes of Paradise
To hail thee first and greet thee, as they should.
—James Whitcomb Riley.

Great Golfers; their Methods at a Glance. By Geo. W. Beldam, with contributions by Harold H. Hilton, J. H. Taylor, James Braid, Alex. Herd, Harry Vardon. Illustrated by 268 action-photographs. 481 pages. Macmillan. Price \$3.50 net.

Bog-Trotting for Orchids. By Grace Breylock Niles; 310 pages. Many full-page plates, colored and uncolored. G. P. Putnam's Sons. Price \$2.50.

Around the Caribbean and Across Panama. By Francis C. Nicholas, Ph.D. Illustrated with maps and half-tones from rare photographs; 373 pages. H. M. Caldwell Company. Price \$2.

Field Book of Wild Birds and Their Music. A description of the character of music of birds, intended to assist in the identification of species common to the eastern United States. By F. Schuyler Mathews. With numerous colored illustrations and complete musical notations of bird song; 262 pages. G. P. Putnam's Sons. Price \$2.

From Stillwater Camp.

JERSEY CITY, July 4.—*Editor Forest and Stream:* We were the happy recipient of a nice mess of mountain trout from the game reserve of St. Lawrence county, New York, being a small part of the result of the skill of Dr. Geo. J. Hornung and his wife. Dr. Hornung, you will remember, is a member of the Wells-Bird Reserve Game Association, and we were with him at Stillwater Camp during the deer season last fall. The fine head of a five-point buck graces the rooms of the Sit-down Club in Jersey City, and is a trophy of the doctor's skill. The doctor and his wife spent a week on the reserve in June, and they had fine fishing. It is a question who caught the most trout, the doctor or his estimable wife. Mrs. Hornung enters into all the outdoor sports of her athletic husband with the vim and intelligence of no novice; she can throw a fly, handle a Winchester, or paddle a canoe with the best amateur.

Mr. Spear, president of St. Lawrence County Bank, and one of the incorporators of the preserve, has recently added 10,000 more acres to the game preserve, making some 40,000 acres in all, abounding in deer and the finest of trout brooks. We saw few grouse.

Dr. Hornung knows not only how to lure the fish to his reel, but also the secret of preserving them. His rule is, of course, disemboweling (this often on the brook), being careful never to sever the head or let the body touch water. Place the fish on leaves or moss or a cloth, then on or near ice, and in this way they will keep for days. Upon coming home, wash the fish and wipe dry, and they will be found to be firm and of full flavor, reminding one of the babbling brook and balsam groves of the distant woods.

When we were sojourning in the early sixties on the Beaver Meadows of Warren county, New York, Mrs. Jacobstaff had a way of capturing trout for breakfast of mornings when her husband was at work, and when a successful catch of big ones would appear, say 1 or 1½ pounds, she would put in a shallow pan in rich cream and bake, and they were delicious. She much preferred good sweet oil to butter for the frying-pan. Is there anything in the wide vocabulary of the culinary department equal to a fresh fontinalis properly presented?

Young Geo. Hornung—a true chip of the old block—

WHERE THE BIG ONES HIDE.

left for the preserve on his vacation last week to remain a few months; Mrs. Hornung will follow with her daughter and younger son during the present month for the summer in camp, and the doctor will be on hand in October, when the deer season opens. They will all have a good time, we opine. James O'Brien, the able and reliable guide of the second camp, will attend with grace and efficiency to the wants of Mrs. H., while the old veteran, Arven Eastman, will see that the genial doctor does not want for one shot or more if necessary at the fleeing cervus.

We know that Jacobstaff will receive his quota of the rich result of the outing.

One of the photographs shows a canoe built by Mr. Rushton, of Canton, who is a member of the Stillwater Club. The club has some fifteen of these canoes of Rushton build, and they are good ones. Mr. Rushton's latest

canoes are the Adirondack Boy and the Adirondack Girl; light as thistle-blows, they draw but two inches of water. JACOBSTAFF.

Salmon Culture in America.

Editor Forest and Stream:

In your issue of July 2, under the heading "Fish Chat," your intelligent contributor, Mr. Edward A. Samuels, pays some rather doubtful compliments to the writer. While stating that he "would have no controversy whatever with The Old Angler," he endeavors, by hearsay evidence to throw doubt on the statements made by him from his own personal knowledge, and from the most authentic documents, namely, the Blue Books of the Fisheries Department of Canada and the Reports of the State Commissioners of New York, Connecticut, Massachusetts, Vermont, New Hampshire, and Maine.

Mr. Samuels is a charming writer, as all can testify who have enjoyed his fascinating book, "With Fly-Rod and Camera," and his numerous contributions to your columns. He is master of a fine descriptive style, and writes of angling as one who pursues a fine art and appreciates and enjoys all its surroundings. He is a true woodsman, and is familiar with the blackened timber of our forests, with our smoky Indians, our racing streams with their right-angled log-jams, their bars of sun-warmed shingle, and the click of shod canoe-poles, and he knows the difference between a couch of new-pulled hemlock and one of coarser and less fragrant spruce.

In most things connected with sport, The Old Angler is ready to defer to his younger brother; but on the subject of salmon culture in the Dominion of Canada and in the Northern States, he thinks he may, without arrogance, claim that he has had superior opportunities of knowing the facts, and has devoted more time and attention to their study, not as mere dilettantism, but as a matter of official duty.

While I fully share Mr. Samuels' disinclination to enter into any personal controversy, I am very desirous that real facts, and not mere loose hearsay reports, should guide the judgment of those who have been "led to believe that the artificial stocking of our rivers is not only feasible, but absolutely necessary." Therefore I am induced to state the facts in all the cases cited by Mr. Samuels under the head "visible results."

In the case of the Merrimac River, in which the fish commissioners of Massachusetts and New Hampshire have planted so many hundred thousands of salmon fry, there is not, so far as I can find from the reports of these commissioners, a particle of evidence to show that the few fish now occasionally seen in that river are the progeny of the fry planted. Ever since the dams were made passable to salmon, a few have ascended from the estuary. The late Professor Spencer F. Baird assured the writer that salmon were never "totally exterminated from that river," and he expressed the strongest hopes that artificial culture would restore its stock; at that time I fully shared these hopes. Thirty years have since passed, and so far as can be learned from the commissioners' reports, no practical results have been produced. The estuary yields no salmon to the net fisherman, nor does its upper waters yield any to the angler. These reports are easily obtainable by Mr. Samuels or by any one who wishes to know the truth. To these I commend their careful study.

In the Penobscot River, in Maine, the conditions never were "almost exactly the same" as obtained in the Merrimac. Ever since salmon fishing in the estuary and mouth of the Merrimac ceased to be profitable, a very considerable annual catch has been made in the lower reaches of the Penobscot. Thirty years ago the writer pointed out to the late Commissioner Stillwell that nothing but excessive fishing in these lower reaches prevented the upper waters from giving good sport to the angler. Since the brush weirs and nets have been reduced, larger numbers of fish have reached the upper waters, and from their progeny, not from the small number of fry planted, has the stock increased. But even now, with all the experience of the past to guide them, the commissioners still allow excessive netting, and angling is allowed from April until September. There is not a particle of evidence that the increased stock came from the fry planted, while there is almost absolute demonstration that to the clearing out of the brush weirs and to the reduced netting is the improvement due.

Of Port Medway, Middle River, and Margaree, in Nova Scotia, the writer can speak with more confidence, for these rivers and all others in that Province came under his immediate observation in the course of his official duties. In Port Medway there were more salmon taken illegally in 1870 than were legally taken in 1902, and I am wholly unable to understand what Mr. Samuels means to convey by the words "the story is the same" applied to this river. Surely he does not believe that salmon were ever "nearly exterminated" in Port Medway! It is quite true that before confederation, when the Nova Scotia law was very loosely enforced, but few salmon got up the poorly constructed fishways in the dams, and that many of them that reached their spawning places were speared by Indians. When the Dominion fishing laws were enforced, and local guardians appointed, the dams were made more

easily passable, and wholesale slaughter below them was stopped. To better protection much more than to the insignificant number of fry planted, is due the preservation of this fine river. But the fact remains that the annual catches show a steady decrease, while the contrary should be the case if the planted fry reached maturity and propagated.

I do not know on what authority Mr. Samuels makes the statement that twenty-five years ago not a salmon existed in Middle River; but I do know that when I last visited it officially, twenty-six years ago, I had fresh salmon for breakfast and dinner, which the warden told me was caught in the mouth of the river, about a mile distant. In all probability more fish ascend the river since the law has been better enforced; but there is not the slightest proof that the paltry number of fry planted in it has had anything to do with the improved angling which Mr. Samuels reports. On that occasion I also visited the Margaree in Cape Breton. At that time it was, indeed, netted, speared and seined to desolation; but so great was the stock even then that not a year has passed since when fair angling was not found in some of its splendid pools. Perhaps no river in the Dominion can be named that owes its preservation from total destruction entirely to the protection the enforcement of the fishing laws has afforded. It is also the only river I know in which salmon are now as plentiful as they were forty years ago, and yet the total number of fry turned into it is absolutely insignificant—about equal in number to the ova of fifty mature fish.

Mr. Samuels' mention of Dunk River in P. E. Island is most unfortunate. He must be wholly unacquainted with the facts, which are the exact opposite of those he gives. Forty years ago Dunk River had a fair stock of salmon for so small a stream. So far from anglers being "scared out of a year's growth by the capture of a salmon in its waters," they resorted to it for the express purpose of being "scared," and were very seldom disappointed. In 1880, when the island had the Minister of Marine and Fishing in the person of the late James C. Pope, a salmon hatchery was established on Dunk River, which still had its small stock of salmon. This hatchery was operated eight years, and 6,145,000 fry were planted in its waters. So far from any increase in the number of fish resulting, the record shows an astonishing decrease. In the sixth year of its operation ova sufficient to produce 1,100,000 fry were procured. In the seventh year but 500,000 fry were produced, and in the eighth year but 400,000. The parent salmon were becoming so scarce and so difficult to procure that the hatchery was abandoned. If, as Mr. Samuels informs us, it has since become a fairly good

ON THE DEADWATER OF DE GRASSE RIVER.

salmon stream, the fact goes far to show that the fish will do better without any artificial assistance beyond reasonable protection.

The only semblance of argument put forward by Mr. Samuels is contained in the paragraph headed, "If these streams had not been stocked?" and that is so purely negative as to be worthless. He writes: "Now, while it may be, and probably is, true that The Old Angler is right when he states that the catch of salmon has lessened annually since the practice of artificial propagation began" [the evidence of this was given by figures from the Blue Books of the Department of Fisheries], "it seems plain to me that the decline is not attributable to the practice; but if no efforts had been made to keep up the stock, the catch would have lessened much more quickly than it has." In all that The Old Angler has written on this subject, not a word can be found which conveys the idea

that he attributed the decrease in the catch to the hatching houses, although he has indubitable facts in his possession which, in some cases, point very straight to this conclusion. Dunk River furnishes some of these facts, and Grand Lake Stream in Maine others, to which I would direct Mr. Samuels' special attention. The writer's contention has been that if half the expenditure the hatching houses have entailed had been devoted to the reduction of excessive fishing, longer close time, and careful protection of the fish on the spawning grounds, better results would now be visible than any the hatcheries have produced.

Against Mr. Samuels' negative argument above, which the context shows was drawn principally from hearsay, not from his own knowledge, The Old Angler would state the following facts: Under his personal direction "eyed ova" from the Restigouche house have been transferred to the Miramichi and St. John houses, there hatched and planted in these rivers; but never has a Restigouche grilse or salmon been caught in either. Under his personal direction salmon fry from the Restigouche house were, for several seasons in succession, planted in the Nepesiguit, but never has a Restigouche fish been taken from its waters. Under his personal direction salmon fry from the Miramichi house have been planted in the Richibucto and Shediac rivers, but a Miramichi salmon has never been caught in either. Under his direction have salmon fry from the St. John house been planted in Skiff Lake in Canterbury, but never has a *Salmo salar* been caught in its waters, though landlocked salmon (ouananiche) are plentiful there. Under his personal direction ova from River Philip in Nova Scotia were transported to the Miramichi house, hatched there, and planted in the Northwest Branch, but a River Philip salmon has never been caught in Miramichi waters. Since his retirement from the fisheries service, planting salmon from the various hatching houses has gone steadily on, but no evidence of any practical results can be found after careful inquiry among the fishing officers of the Province.

I commend the consideration of these facts to Mr. Samuels and to all who are interested in the question. If he or any reader of this letter can produce facts that tell a different story, no one will be more pleased to read them than

THE OLD ANGLER.

Playing a Musky to the Gallery.

It was at Wrenan's Lake, up near the Leach Lake Reservation. The day was already spent, the sun sinking in a sea of golden glory, leaving the lake now to revel in a mass of blues and purples that came with the twilight in this northern country. The day had been so calm that luck proved poor, and all the boats were in and the ladies and gentlemen, to the number of twenty-five, were in the camp dining room at their supper.

Around the bend (without the accompaniment of iron-shod canoe-poles) came Mr. G. and his son, Walter, the guide propelling the boat slowly along the deep water offshore. They had thrown out their heavy spoons, hoping against hope of a musky. Within a hundred yards of the landing stage, the unexpected happened, a maskinongé that weighed, when landed, 29 pounds, and measured a good 4 feet, struck the spoon of the elder Mr. G. Away went the fish for deep water, striking a high C on the reel and keeping it up for a run of fifty feet or more, only to come to the surface and fly into the air like a catapult. With a splash that sent the flying water in a wide circle, it took an extended run straight in line for the landing stage. This was a fortunate omen, for this was a fish that would dodge the gaff and needed a rifle ball to prepare him for safe landing. To the right and left, now deep down, now out of the water, the monster fish made his play. Mr. G. was not over certain of his tackle, and at the first signs of the fish remaining still in the water and submitting to being towed, instead of performing that office himself, Walter began to work the boat toward the landing stage, and sent up a shout for "Help! A rifle!" that brought every diner from the table, some with napkins tucked in their necks and others carrying them trailing in their hands. The cry of "help" portended nothing less than a drowning accident, and naturally the tables were instantly deserted.

The landing stage was at once a rendezvous for a chattering, excited group of men and women, their presence starting the nervous fish to fresh attempts at freedom. Up he went into the air, and from a dozen throats came as many different kinds of volunteered advice as to the proper thing to do. And amid the din and confusion Walter yelled, "Won't someone get a rifle?" Now, Mr. G. naturally was more or less concerned as to landing the fish, and with a group of guides on the landing stage watching every move, Walter was on his mettle. So far all had gone well, and the fish was well in hand, and by the time the man with the gun had arrived it was once more quiet. The man who handled the rifle became at once violently attacked by the maskinongé fever. The first shot barked the skin off the maskinongé's nose, and set him going once more. He leaped and dived in a staccato sort of a way, a kind of rag-time fish performance, and the man with the magazine full of shells began to pump. He followed the movements of the fish as one would follow a blue-wing teal coming down wind, or rather the flight of an English snipe, and considering that the maskinongé was on one side of the boat one minute and on the other the next, the bullets began to whiz about Walter's ears, and Mr. G. began to duck. Pandemonium reigned. Those on the dock kept shouting advice, the women folks got hysterical, and the guides roared with laughter over the Wild West piscatorial circus, Walter and Mr. G. Sr. and Jr. yelling at the top of their voices to the rifleman to "let up." But he was too excited to do anything but pump that magazine and pull the trigger every time the musky showed his head above water.

One bullet went through the guide's oar and another through the bow of the boat, and then Walter commenced some choice lumber-jack profanity which, for the sake of the ladies, fortunately—on account of the excitement—fell on deaf ears. Mr. G. and his son yelling at the marksman at the top of their voices, ducked low in the boat, Mr. G. Sr. being equally divided in the fear of losing his life and the fish at one and the same time.

It must be remembered that all this happened on the Fourth of July, and certainly was giving the guests a

touch of the noise and bustle of the town carried into the forests primeval. A lucky shot—or perhaps to put it better, the musky swam into the zone of fire and caught a ball in his head, and forthwith rolled on his side, exposing his ivory belly to the gaze of the beholders, and when the white flag appeared the sharpshooter desisted, and throwing his hat well back from his perspiring brow, struck an attitude of expectant praise and congratulation! The ladies and gentlemen cheered as Walter now gaffed the comatose fish and the guides slapped their thighs and roared only as a group of hardy woodsmen can on occasions. Walter was white as a sheet, and beads of perspiration stood out on his forehead, for he no doubt felt as one who had been through a shrapnel fire, and took a long breath to satisfy himself that he was yet sound of body and limb and still lived. Mr. G. and his son allowed their feelings of exultation to replace those of bodily fear from which they had so recently suffered.

But it was a glorious victory, and with Walter carrying the glistening monster upon his back, the procession started up the steps to the lawn in front of the camp, where the fish was officially and ceremoniously weighed and measured.

And then Walter joined the guides, and the battle was fought all over again, and when Mr. G. took his seat at the table he was plied with questions and showered with congratulations, Mr. C., the marksman, receiving no small part of the attention because of his wonderful marksmanship.

The fish was expressed to a taxidermist, and in due course he replied that it had safely arrived and would be mounted in his best possible manner, but as to its being a maskinongé—no! It was neither a pickerel, a great northern pike, nor a maskinongé—it was a jack salmon! Now won't Mr. Hallock or The Old Angler or Mr. Samuels or Dr. Henshall arise and tell us something about jack salmon that look like maskinongé—but are not maskinongé?

CHARLES CRISTADORO.

ST. PAUL, Minn., July 6.

Newfoundland Notes.

L. F. BROWN.

ST. JOHN'S, Newfoundland, July 5.
—Editor *Forest and Stream*: Many readers of *FOREST AND STREAM* will remember an interesting discussion on Kipling's "Red Gods" which ran through several impressions last fall. Mr. L. F. Brown, widely known to readers of sporting journals as a graphic and prolific writer of descriptions of the fish and fishing haunts of nearly the whole continent, started the "conflagration" by a criticism of his on Kipling's poem. Your correspondent took a hand in

with the bigger fellows and tried to kill off the plucky little bunch of fighters led by the redoubtable L. F. Imagine my surprise the other day, when, responding to a telephone call from the railway depot, I heard: "L. F. Brown, you know. You remember the Red Gods discussion last year in which you took a hand? Well, I'd like to shake with you." A few minutes after we were "shaking." I expected to find a lanky, atrabilious cynic; and behold, here was a fat, jovial, big-hearted, good-natured looking fellow, chock full of fun and interesting experiences. Only for my feelings of loyalty to the gallant band led by Mr. M. Hardy and the venerable Old Angler, I fear I would have been tempted to forswear my allegiance to Kipling. Mr. Brown talks as interestingly as he writes, and my main regret was that his stay was so short. He is accompanied by Doctor Doty, of New York, and both gentlemen are obeying the behests of the red gods, and are now seeking "the chosen waters, where the sea trout's jumping crazy for the fly." They left for Salmonier that evening, and as very good reports come from there the last few days, it is to be hoped that Mr. Brown will get some fish and the doctor some photos, for which he is equipped with no less than three cameras of various sizes. After they leave Salmonier they intend visiting Gambo and Red Indian Lake, and if *FOREST AND STREAM* does not get some interesting illustrated notes from these places at an early date, I am much mistaken.

I send you herewith a few clippings that may be of interest to your stay-at-home readers.

W. J. CARROLL.

Fish and Fishing.

The Alarming Scarcity of Salmon.

THERE is an alarming scarcity of salmon in Canadian waters this year. In only a few of the rivers, so far, has there been anything like the usual sport for anglers. Mr. Adams and Dr. Heber Bishop, of Boston, were fortunate in having good sport early in the season on the Moisie; but owing to the large volume of water and the numerous pools in this river, it is difficult to imagine a scarcity of fish there. In many of the smaller streams the fishing has almost entirely failed. Particularly has this been the case on the Mistassini and the Riviere a la Truite. Last year Mr. Charles Stewart Davison, and in former years Dr. Henry Van Dyke enjoyed splendid fishing on the latter mentioned river. This summer it has dwindled down almost to the dimensions of a brook. The same thing is true of the Mistassini, on the same coast. Mr. Bayard Dominick, the New York broker, and his friends, who were fishing it, gave it up for a bad job some time ago, and left for home in the last week of June. Whether or not the fishing would improve with heavy rains sufficient to materially raise the level of the rivers, it is difficult to say, though there are those who believe that there must yet be a very large though late run of fish. That the scarcity of fish is really the cause of the wretchedly poor fishing this season is shown by the fact that the catch of the net fishermen has fallen off equally with that of the anglers. In many instances it has been very much less than half the catch of last year. Many of the Quebec market dealers are quite short of their supply of salmon, and prices are at least fifty per cent. higher than usual

at this time of the year. Should there be no later big run of fish, we may have to accept the distressing story that the salmon of the North Atlantic, in common with other forms of fish life, are really suffering an alarming decrease in numbers as a result of the depredations of the swarms of dogfish which infest the coasts. There is certainly good cause for the cry of alarm which comes from the fishermen of both the Maine coasts and those of the Maritime Provinces of the Dominion, as to the destructiveness of these pests.

Something Like the Marston Trout.

Not many days ago I was shown a very handsome lot of trout that had been taken for specimens of the beautiful variety named by Professor Garman for Mr. Marston, of London, England. There were several dozen fish in the lot, averaging from half a pound to three-quarters of a pound each in weight. In their long and somewhat narrow shape, and still more in their gorgeous coloring, they certainly resembled very closely the *Salvelinus oguassamaronii*. The deep red splash of coloring along the lower part of the body was present, and very much brighter than that which adorns the ordinary fontinalis, even when attired in his richest livery at the approach of the spawning season. But there the resemblance ceased, at least so far as outward appearances go. An examination of the fin rays showed that they did not correspond with the description given by Garman, and moreover the caudal fin lacked the distinguishing emarginate characteristic of the Marston char. Everybody knows that difference of coloring, especially in the salmonide, does not prove a distinct variety. Yet both the shape and coloring of these trout were so different from those of the ordinary fontinalis that I have been wondering since whether they may not have belonged to one of the many Alpine varieties which are undoubtedly represented in Northern Canada, and have come to regret that I did not make a more careful examination of them when the opportunity presented itself. I saw the fish in the depths of the forest, too far away from civilization to be able to bring the specimens out of the woods in a fresh condition, especially in the absence of both ice and alcohol, and the only opportunity I had for comparative study of them was a copy of the fin formula of the Marston trout which I carry with me when fishing, hoping some time to secure the further specimens of the fish which are so much desired both by Mr. Titcomb and Professor Garman. I satisfied myself that the fish were not of this variety, and that was all. I am sorry to say that it did not even occur to me at the time to make a memorandum of the fin rays of these beautiful fish. They were captured in a small lake not far from Lake Eternity, a large body of water forming the headwaters of the Eternity River, which in its turn flows into the Saguenay at Eternity Bay, between the far-famed Capes Trinity and Eternity. These fish would not look at the ordinary large trout flies used for speckled brook trout in Canadian waters. Mr. D'Aubigné, of London, England, to whose rod they fell, killed them upon small brown flies, next size to midges, tied upon No. 13 to No. 15 hooks, and with a casting-line that was nearly as fine as a gossamer thread. This successful fishing was done upon a clear, bright day in the latter part of June, when the uneducated trout in the neighboring lakes would not look at an ordinary fly, and were only to be taken with a troll. May not this experience suggest that success awaits the use of smaller flies and the practice of dry fly-fishing in American waters in those midsummer months in which the clear chalk streams of Britain are made to yield good sport to the dry fly-fishermen of that country?

E. T. D. CHAMBERS.

Salmon of the Moisie.

FRIDAY evening, July 1, as Mr. J. B. Goodhue, of Derby Line, Vt., a genial sportsman, and I were on the cars coming from the Sherbrooke, Quebec, tournament, we bumped up against an old and dear friend I had not seen for nearly, if not quite, three decades of years, Dr. Heber Bishop, of Boston, the champion American moose hunter, and a genial all-around sportsman and good fellow.

The doctor had with him Mr. Walter Adams, of Boston. They were on their way back from a most successful and record-breaking salmon fishing trip on the Moisie River on the Labrador coast. This river is owned by Mr. Ivers W. Adams, of Boston, and is without question one of the best salmon rivers in the world. The salmon are numerous, and rival in size those of the celebrated Cascapedia. At the Moisie the doctor was one of a party composed of Hon. Ivers W. Adams, Walter Adams, B. F. Dutton, and Harry W. Reed, all of Boston, and Senator Aldrich, of Rhode Island. They fished the river from June 13 to the 21st, eight days, and their total catch was 184 salmon that weighed 4,438 pounds, an average of over 341 pounds each. Dr. Bishop's individual score was 31 fish that weighed 731 pounds; this is truly a record breaker. This river empties into the north shore of the Gulf of the St. Lawrence, well up north of latitude 50 degrees, and during their stay there the temperature ranged from 28 to 53 degrees, and the mean temperature of the water in the river was 38 degrees.

While Father Time has silvered the locks of the doctor somewhat, his love for fun is as keen as it was over a quarter of a century ago. He had not forgotten many of the little sporting incidents that happened during the days of our early friendship, nor how we taught him how to cast his first fly; neither had he forgotten the airs that my then young son, now a clergyman, played on the violin; he not only whistled them for us, but he added a few variations and cadenzas as embellishments.

He and Mr. Adams had in the express car a box containing half a dozen fine fish, packed in snow, which they found in the ravines near the river. Nothing would do but that box must be opened, and one of the salmon—a 24-pounder—was taken out and presented to Mr. Goodhue and myself, with positive instructions to present a good slice of it to the "Reverend," who duly received and appreciated it, remarking that the Lord loved a cheerful salmon fisher, and "blessed be the donor, for he hath given much and expected nothing in return."

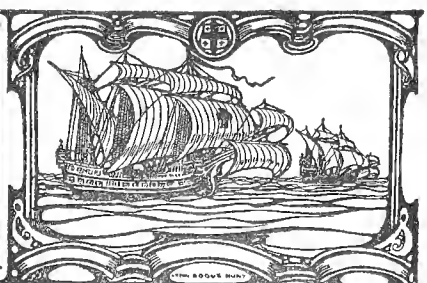

There was a certain fish—a 230-pound sturgeon—that they did not bring home with them, and "thereby hangs a tale." The rope slipped off its tail and it departed with the tide, etc.

STANSTEAD.

MANSONVILLE, Quebec, July 5.

YACHTING

Brooklyn Y. C. Ocean Race.

BY CHARLES D. MOWER.

THE ocean race under the auspices of the Brooklyn Y. C. for a five hundred dollar trophy offered by Sir Thomas Lipton, proved an unqualified success in every respect, as the management of the affair was excellent, a good fleet of boats started, and the weather conditions were so favorable that the boats made a record run which probably will not be equalled for a long time, if ever, by a yacht of less than 40ft. over all length. With the exception of about five hours of calm on Sunday evening, the yachts had a strong breeze throughout the run, and were able to carry spinnakers nearly all the time with absolutely no head winds or fog. While the entries were passed by the committee as eligible cruisers, the boats widely varied in type, as there were some of the old style deep narrow cutters, others of less draft and more beam, and boats of more modern type like the yawl Fanshawe, a fine cruiser with moderate overhangs and large accommodations. The modern fast cruiser of the knockabout type was represented by Little Rhody, a boat fast enough to race successfully, and yet a craft which could not consistently be barred out by the committee. Still another type was seen in Newasi, a Gardiner-designed sloop, with narrow beam and long fine ends carrying a double head rig. The smallest boat of all was the little yawl Sea Bird, owned by Mr. Thomas Fleming Day, the originator of the race. The system of time allowance used was an arbitrary allowance of 40m. per foot of over all measurement, and this made Newasi the scratch boat, though she was one of the smallest of the fleet in actual size and tonnage. Of the eighteen entries, the actual starters were as follows:

Sloops.—Newasi, Larchmont Y. C., A. H. W. Johnson, owner; Mignon, Indian Harbor Y. C., Dr. J. Fournier, owner; Eumareia, Rhode Island Y. C., E. K. Hill owner; Mopsa, Harlem Y. C., F. C. Sullivan, owner; Little Rhody, Rhode Island Y. C., C. F. Tillinghast, owner; Ray II., Brooklyn Y. C., G. R. Hawes, owner.

Yawls.—Fanshawe, New Rochelle Y. C., F. Maier, owner; Sea Bird, Springfield Y. C., T. F. Day, owner.

The boats were manned by amateurs, with one professional allowed.

The contestants all reached the Gravesend Bay anchorage before the day set for the start, and were most hospitably cared for by the Brooklyn Y. C. Saturday morning all hands were busy making final preparations for the start, for there were, as usual, many things to be done at the last moment. The committee went through the fleet in the club launch to inspect the different entries, and passed their final approval that the boats met all requirements, were eligible and fit to start, then went on board Commodore Fontaine's flagship Sunshine, which was anchored off the club grounds to give the starting signals.

At 10:45 the preparatory signal was given, then the warning gun, and at 11 o'clock the signal for the start. A fine northwesterly breeze was blowing of sufficient weight to call for a single reef on some of the boats, and to make things lively for all hands. The work for position before the start was interesting, and resulted in the yawl Fanshawe getting away first, with Sea Bird second;

good work for the two yawls. Then came Little Rhody, Mopsa, Siren, Ray II., and Eumareia, in the order named. Newasi was late, about three minutes behind the gun, and Mignon was last over. All crossed on the starboard tack, then, with a long leg and a short one, beat out to Norton's Point. Little Rhody went at once into first place, while Newasi lost but little time working through the fleet and passing all except Little Rhody. After clearing Norton's Point, booms were squared off and spinnakers quickly set for the run to the eastward. The fleet made a very pretty picture running off before the freshening breeze, with spinnakers and balloon jibs drawing, Little Rhody leading, and Sea Bird, carrying her picturesque square sail, bringing up the rear of the procession. A course of E. by S. took the fleet to the Rockaway Inlet buoy, which was passed at noon by the leaders, and patent logs were set by many of the skippers to test their accuracy for the known distance between the Rockaway buoy and the Fire Island lightship.

Off the wind in a good breeze there was but little change in the positions of the boats, as all were making good speed. Little Rhody held her lead, and passed the Fire Island lightship at 4:50, with Newasi second, only 7m. astern, and Fanshawe and Ray II. not far behind her. The fresh breeze had raised a fair sea, and on several of the boats its effect was felt by some members of the crew. The wind increased somewhat toward sunset, and light sails were taken in on many of the boats. Little Rhody simply changed the big spinnaker she carried through the afternoon for a smaller one, while Newasi took in all light sails and tucked a single reef down in her mainsail. Darkness soon shut the boats out from one another's sight, and the crews gave the strictest attention to their own craft. The night was a beautiful one, as the stars came out wonderfully clear and breeze held true. At about ten o'clock the moon rose up out of the sea, and as it rose slowly and grandly in the cloudless sky, its light made the stars gradually lose their brightness. After the moon had risen, many of the boats set their light sails again, and carried them for the rest of the night. As dawn came and the light became stronger, those in Newasi first saw a sloop on their starboard quarter carrying spinnaker and topsail, which proved to be Ray II., off on the weather quarter another sail was made out to be the yawl Fanshawe, while back on the horizon were sails which could not be made out, but ahead nothing could be seen of Little Rhody, as she had been driven hard all night, and had increased her lead decidedly. As soon as light sails were set on Newasi she drew away from the two boats which had nearly caught her in the night. Through the forenoon the wind increased, and the sea became very heavy and reefs were tied in on many of the boats. Little Rhody at one time had three reefs tied down, but as she seemed to carry three reefs but little better than she had a single, her nery crew decided to put the whole mainsail on her, and make her lug it. Newasi was driving wildly along with spinnaker, balloon jib and topsail set over a single reefed mainsail, and was fairly tearing through the water. The balloon jib was straining till it seemed as if the pressure of wind must burst it, and mainsail and topsail both drawing finely. The spinnaker was sheeted well forward, and when the extra heavy puffs came, the pole would lift and the sail belly out and go up like a huge kite. The man who was stationed out on the

spinnaker pole to hold it down, had a most exciting position, as the seas were now so large that the boat would climb up to the crest and then rush down into the hollow of the next with the speed of an auto boat, and if she yawed a bit, the end of the main boom would dip and drag through the seas, while the spinnaker went up till the man on the boom seemed miles above the water. Looking forward he would see the bow go down till the bowsprit carved its way through solid water, and the forward deck was awash. Then looking aft he saw the huge following seas, with their crests breaking and a white path of foam in the yacht's wake. As the wind was increasing, it became a question of how long the yacht could be driven, and of how long the sails would stand the strain, and at last the order came to "take in the spinnaker." It was no easy work to get the big kite in, as the 25ft. pole was rigged without lifts and outhaul, but the crew made good work of it, and the sail was soon safely down on deck. Next the topsail came down, and with the boat rolling about it was no easy job even for the "human fly," as the masthead man was nicknamed, to go aloft and get the lashings off the heel of the pole. With the kites off, she went along easier, but the skipper, wishing to take no chances on losing his spars, ordered a second reef in the mainsail. It was necessary to lower the sail to do this, so a gaff trysail was set and carried for a while, and this allowed both Ray II. and Fanshawe to come up and pass Newasi.

As the wind seemed now to be moderating a little, the mainsail was again hoisted, with only a single reef, and the light sails set again. Fanshawe was soon passed, but Ray II. led a longer chase, and it was some time before Newasi regained her lost second place. At about 4:30 on Sunday afternoon Little Rhody was sighted coming out from in toward shore, where she had spoken a fisherman, and gotten the course and distance to the lightship. At about six o'clock, Newasi sighted the lightship, almost dead ahead on the course she had steered since leaving Fire Island lightship, and at 6:30 was within a short distance of the light vessel, when the wind died out completely, and left all hands becalmed. Little Rhody got near enough to speak the lightship at 7 o'clock, then drifted out with the tide, and at eleven caught a little breeze and worked back to it again. Newasi, catching the same breeze, came up and hailed the lightship at 11:30. Fanshawe and Ray II. were not far astern, as they, too, got the light air which had sprung up after lying becalmed for about five hours. Before starting from Gravesend Bay the question of crossing the shoals was discussed, and it was decided that all should go completely outside of all the shoals, but later this decision was reversed, and Newasi was not notified, so after passing the lightship, she stood off to the eastward for nearly twenty miles, while the others all stood north straight across the shoals. When daylight came Newasi was well offshore with a very light air, while the other boats were in under Sankaty Head on Nantucket with a good breeze off the shore and a favoring tide. When the breeze came Newasi was far behind the others, though at the time her crew, supposing the other boats had come outside of the shoals as agreed, thought they were still in second place, and were dumbfounded when in the afternoon, off Nauset, Ray II. was made out ahead. Off the Highlands Newasi passed Ray II. for the third time during the race, and

LITTLE RHODY.

NEWASI.

Winner of second prize in the Brooklyn Y. C. ocean race.

courses were laid for Marblehead after passing the whistling buoy off the Highlands. The wind was strong from the SW. crossing Massachusetts Bay, but Little Rhody kept on her balloon jib and carried it to the finish. Newasi, about three hours astern of Ray II., went across under her three lower sails, while Ray II., when last seen by Newasi, was staggering along under lower sails, top-sail and flying jib. The yawl Fanshawe was in second place, having done fine work up the Cape shore, but her navigator mistook the lights on Thatcher's Island for the Baker's Island lights, and she ran far off her course, and was obliged to lay to until daylight before she got her bearings. The run across the Bay from Provincetown to Marblehead was most exciting, as the wind was heavy and the sea was high enough to break on the highest crests. Many of the amateur skippers and crews doubtless recalled Mr. Connelly's excellent tales in "Out of Gloucester," and imagined themselves second Tommy Olesons as they drove their craft along with all the sail they could stagger to.

It was necessary to keep a sharp lookout for other vessels, and to locate and identify the lights along the shore. As the night was beautifully clear, this would have been very easy had it not been for the many fires and fireworks on shore in celebration of the glorious Fourth. Minot's was the first light to be picked up, and this was unmistakable, as it flashed its one-four-three. Boston light could also be seen, and soon the bright twin lights on Thatcher's were in plain sight. Baker's twin lights, one above the other, were next seen, and then Marblehead light, this somewhat hard to distinguish from the electric lights on shore close by it.

Little Rhody finished off the Boston Y. C. house in Marblehead harbor at 9:38 P. M., on July 4, having made the total run of 330 miles in 58h. 42m., which is wonderfully fast time for so small a yacht to make on an ocean course. Newasi was second to finish at 12:40 A. M., July 5, 2h. and 50m. behind Little Rhody, and Ray II. found her way into the harbor some three hours later than Newasi. Fanshawe and Mignon arrived the next forenoon, after having explored the islands between Thatcher's and Marblehead, while Sea Bird, which had dropped just far enough behind to miss all the luck of wind and weather, finished on the evening of the 6th.

After the race was over, the owner of Ray II. protested Little Rhody and Newasi, claiming that they were racing craft and should not have been allowed to enter. He, of course, claimed that his own boat, Ray II., which, through the mistake of Fanshawe and Mignon in missing the rocky entrance to Marblehead harbor in the night, had finished third, was an ideal cruising craft, and had undisputable claim to the Lipton Cup. It is difficult to see how Mr. Hawes' claims can be allowed, as both boats he protests were inspected and passed by the committee in charge before the start of the race.

Little Rhody, the winner, was built by the Chase Pulley Company, at Providence, from a design by Mr. George Owen, for Mr. C. F. Tillinghast. She is 34ft. 6in. over all, 22ft. waterline, 8ft. 6in. beam, 5ft. 6in. draft, and carries 650 sq. ft. of sail in jib and mainsail rig.

Newasi was designed by William Gardiner, and built by Gilbert Smith at Patchogue in 1898, for her present owner, Mr. A. H. W. Johnson, of the Larchmont, Atlantic, and Manhasset Bay Yacht Clubs. She is 38ft. 8in. over all, 25ft. waterline, 8ft. 4in. beam, 6ft. draft, and is a pole-masted sloop with double head rig. Ray II. is owned by G. R. Hawes, of the Brooklyn Y. C., and was built by J. P. Smith at Nyack in 1903. Lloyds' Register gives her length over all as 40ft., waterline 29ft. 7in., breadth 12ft. 3in., and draft 3ft. 8in.

Little Rhody wins the hundred guinea cup offered by Sir Thomas Lipton, Newasi the handsome marine painting offered by Mr. Warren Sheppard, and Ray II. the fine marine clock given by the Rudder Publishing Company.

Canarsie Y. C.

Jamaica Bay, Long Island—Saturday, July 9.

THE Canarsie Y. C. held a race on Saturday, July 9. The event was open to boats enrolled in clubs belonging to the Jamaica Bay Y. R. A., and there were seventeen starters. The breeze was fresh from the S.E., and the boats went three times over a 3 1/2 mile triangular course, making a total distance of 10 miles.

Win or Lose and Undine had not been measured, so their corrected times could not be figured. The summary:

Sloops.			
	Finish.	Elapsed.	Corrected.

Beverly Y. C.

Delaware River—Saturday, July 2.

THE Beverly Y. C. held the second race of the season on Saturday, July 2. A fresh N. W. breeze held throughout the race. The catboats sailed three times over a four-mile course, while the Larks covered it twice.

The catboats were sent away at 3:40, and the five starters got away well together. Caroline II. broke down on the first leg and Fiona won easily.

In the Larks, No. 1 led all over the course and won by the narrow margin of 12s. The summary:

Catboats—Start 3:20.	
Fiona, John Perkins.....	5 14 48
Sea Gull, L. C. Cook.....	5 17 15
Gertrude, G. W. Holloway.....	5 21 00

No. 3, J. Taylor.....	4 52 16
No. 4, Edwin Cortright.....	4 54 14
No. 2, Herbert Taylor.....	Withdraw.

Southern Gulf Coast Y. A. Circuit.

Pass Christian (Miss.) Y. C.—Monday, July 4.

THE first of the six regattas of the racing circuit of the Southern Gulf Coast Yachting Association was held at Pass Christian, Miss., on the shores of the Gulf of Mexico, on Monday, July 4. The circuit comprises a series of races, each club in the Association taking its turn, there being a regatta every week until the wind-up at the Southern Y. C. at New Orleans, the date this year being Saturday, August 6. There are cruising races arranged from point-to-point, and a well mapped out itinerary extending over the entire six weeks in which the regattas are stretched out. The racing courses, with the exception of those of the Mobile and Southern Y. C.s, are out on the Gulf Coast in the 100-mile stretch between these two places, so that the short distance makes it convenient for members of the various crews to come and go from time to time, and as there are many who cannot stay away from business for the entire six weeks, the crews are changing more or less and many yachtsmen are afforded a chance for a few days upon the water; yet with all this it is rare that any of the vessels are short handed. The racing course of the Mobile Y. C. is on Mobile Bay, and that of the Southern Y. C. on Lake Pontchartrain, both being mere arms of the Gulf of Mexico.

The Fourth of July this year afforded glorious weather for a yacht race. The afternoon was bright and cool and the racing yachts were hurried twice around the 5-mile triangular course of the Pass Christian Y. C. to the tune of a merry 10-knot breeze, and the water was not over lumpy, that is, for yachts of a larger size, some of the mosquito fleet finding it a little too boisterous to start at all and others withdrawing on the first round. The fast racing machine Virgin, ex-Caroline, late of the Inland Lake Y. A., the entry of the Bay-Waveland Y. C. for the Association championship cup for boats of the Seawanhaka cup class type, carried away her mast during the preliminary work before the race, and Urania, champion of these Class A scows last season, was also unfortunate enough to be disabled; she carried away her gaff jaws. Gladiola, ex-Galatea, sprang a leak and withdrew. The two remaining freaks of this class, Kayoshk and Moki, sailed a grand race and they made the fastest time around the course, the former the best by 2m.

The cabin 25-footer Calypso, sometime champion of the Yacht Racing Association of Massachusetts, lead the fleet in grand style over the entire course, and she was 2 miles ahead of her nearest competitor at the finish. It was Calypso weather, just such a day of which tradition will tell of this great heavy-weather craft having been a heroine many times and oft. This event marked the dropping from this class to the one below of the Boston designed freak Invader, two previous unsuccessful races having been enough. She won in the smaller class of cabin sloops, beating the hitherto almost invincible Nydia. In the one-design class of knockabouts of Mower design, the Sinner won handily. The next event takes place at the Bay-Waveland Y. C., Bay St. Louis, Miss., Saturday July 9. Summary of Pass Christian Y. C. races:

Cabin Sloops over 30ft. Rating.		
	Elapsed.	Corrected.
Calypso	1 31 03	1 29 34
Susie B.	1 44 54	1 44 54

Corinthian Y. C.

Marblehead, Mass.—Saturday, July 2.

A CLUB championship race of the Corinthian Y. C. was sailed off Marblehead on Saturday, July 2, in a stiff W. to N. W. breeze. The wind was very strong in the puffs and a few accidents resulted. In the 30ft. class Chewink IV. and Sauquoit had a close tussle until the leeward mark was reached, when the Chewink IV., much the stiffer of the two, drew gradually away. On the windward leg Sauquoit's throat halliards parted and she was out of it. The 22-footers went away well bunched, Opitsah V. taking the lead at the first mark. Medric caught her on the next leg and held first place to the finish. Opitsah's bowsprit was carried away on the beat in, and she was taken in tow. In the 18-footers Bat led all around the course, closely pressed by Arrow. Carina II. was the winner in the first handicap class, and Suzanne had practically a sailover in the second handicap class. The summary:

30-Footers.	
Chewink IV., F. G. Macomber, Jr.....	Elapsed.
Sauquoit, T. K. Lothrop, Jr.....	1 44 20
22-Footers.	
Medric, H. H. White.....	1 55 05

Class B—Handicap.	
Suzanne, Frank Brewster.....	1 06 17
Carmen, C. Johnston.....	Withdraw.

Monday, July 4.

In a perfect sailing breeze, with a smooth sea, the invitation race of the Corinthian Y. C. was sailed on Monday, July 4. Fifty-two yachts competed, which is the largest attendance at any race this season in Massachusetts Bay. In the 30ft. class Chewink IV. took the lead soon after the start and held it all over the course. In the 22-footers Warrior got the start, but Peri II. went into the lead before the first mark was passed and stayed there throughout the race. In this class Opitsah V. went from last place at the start to second place at the finish. The summary:

30-Footers.	
Chewink IV., F. G. Macomber, Jr.....	Elapsed.
Sauquoit, T. K. Lothrop, Jr.....	1 33 28
Wasaka, S. Reed Anthony.....	1 34 09
22-Footers.

Eastern Y. C.

Marblehead, Mass.—Saturday, July 2.

THE first of the series of special open races of the Eastern Y. C. was sailed off Marblehead on Saturday, July 2, in a whole-sail S.W. breeze. In Class L—E. Y. C., Wasaka led on the windward leg, but on the spinnaker run Chewink IV. went into the lead and remained there to the finish. Sauquoit, which was third at the weather mark, went into second place and held it. In the 22-footers Medric got the start, but Opitsah V., by holding close to the shore, went into first place on the windward leg and led all around the course, with Peri II. a good second. The 18-footers went across the starting line closely bunched, but on the windward leg Bat pulled out a lead and was never headed. The summary:

Class L—E. Y. C.

	Elapsed.
Chewink IV., F. G. Macomber, Jr.....	1 31 50
Sauquoit, T. K. Lothrop, Jr.....	1 33 19

Monday, July 4.

Under the most favorable conditions the second special open race of the Eastern Y. C. was sailed Monday, July 4. In the 30ft. class the three new boats had for competitors, the old Y. R. A. 30-footer Meemer and Dorel, formerly the 30-footer Spalpeen. Meemer got the start, but Wasaka and Chewink IV. soon passed her. Wasaka and Chewink IV. had a hard tussle all over the course, Wasaka leading all the way. Meemer was third boat at the finish. In the 22-footers Medric got the best of the start and led all over the course. A close contest for second place was won by Opitsah V. by 4s. In the 18ft. class, Bat, as usual, pulled out a lead on the windward leg and was never headed. The summary:

Class L.

	Elapsed.
Wasaka, S. Reed Anthony.....	1 22 19
Chewink IV., F. G. Macomber, Jr.....	1 22 40

Beverly Y. C.

Buzzards' Bay—Saturday, July 2.

THE first Corinthian race of the Beverly Club was sailed in Buzzards' Bay on Saturday, July 2, in a S. W. gale. Many of the yachts were half filled with water when they reached the finish line, and one of the 15-footers, Fly, sailed by Miss C. M. Williams, was capsized. In the 30ft. class Young Miss got the start and won easily. In the 21-footers Terrapin took the lead at the start and came home first by a long margin. This was also the case with Jap in the 18-footers. In the fourth class cats Maori won a very close race from Howard. In the 15ft. class, Teaser, sailed by Mrs. R. W. Emmons, 2d, got the best of the start and was more than a mile ahead on the last leg. Teaser was near Fly, when the latter capsized, and Mrs. Emmons at once went to Miss Williams' assistance. In spite of this interruption Teaser won by 29s. The summary:

30-Footers.

	Elapsed.
Young Miss, D. L. Whittemore.....	1 48 14
Pontiac, J. A. Beebe.....	1 49 04

Fly, Miss C. M. Williams.....	Withdrew.

Monday, July 4.

An open sweepstake race of the Beverly Y. C. was sailed on Monday, July 4, in a two-reef, S. W. breeze. In the 21-footers, Radiant made her first appearance and won out from Terrapin by nearly 5m. In the 18-footers Jap had things all her own way. In the fourth class cats, Howard won a good race with Allison II. a close second. In the 15-footers Ranzo won out from Teaser by a little over 1m. The summary:

21-Footers.

	Elapsed.
Radiant, Mrs. C. M. Baker.....	1 55 47

Flickamarro, the Misses Emmons.....	1 16 32

Saturday, July 9.

A club race of the Beverly Y. C. was sailed on Saturday, July 9, in a light S. E. breeze. In the 30-footers Pontiac got the start, but Young Miss soon passed her and led by a small margin all over the course. In the 21-footers Hybrid got a good start, but lost her centerboard soon after. Quakeress went into first place and held it to the finish. In the 18-footers Hindoo won out by over 1m. Allison II. took the lead soon after the start of the fourth class cats and held it to the finish. Catspaw won by over 2m. in the 15-footers. The summary:

30-Footers.

	Elapsed.

Jamaica Bay Y. C.

Rockaway Beach, Jamaica Bay—Monday, July 4.

ON Monday, July 4, an Association race was held under the auspices of the Jamaica Bay Y. C. Five clubs belong to the Association, namely the Jamaica Bay, Canarsie, Old Mill, Bergen Beach, and Bayswater yacht clubs, all of which were represented in Monday's race.

A reefing S. breeze made the racing close and interesting. Ten classes filled. Some of the starters found the wind too heavy and withdrew. In Class K, H. C. Miner capsized.

The start was made off the Jamaica Bay Y. C. house. Courses for Classes A to G, inclusive, and O to X, inclusive: From starting line to the red can buoy in Rockaway Inlet; thence to a stake boat in Broad Channel; thence to starting line and sailed once over. Course for Classes H, J, and K: From starting line to the spar buoy off Block House Point; thence to a stakeboat in Broad Channel; thence to starting line and repeat. Course for Classes L, M, and special raceabout class: From starting line to a stakeboat in Beach Channel below Seaside; thence to a mark boat in Broad Channel; thence to starting line, and sailed over three times.

The winners in the different classes were Marion, Diana, Aurora, Florence, Alert, Josephine, M. E. W., Naomi, Ben Hur and Paula.

The summary follows:

Class C—Cabin Sloops—20ft. and Under 30ft.—Start, 2:04.

New York Y. C.

Glen Cove, Long Island Sound—Friday, July 8.

THE New York Y. C. held its first race for yachts too small for enrollment on Friday, July 8. This event was open to club members and their friends, and was a decided innovation. It is believed by all to be a good idea, however, for the racing of to-day is done by small boats, and should be encouraged.

The race was not a great success when the number of starters is considered. This is most unfortunate, for now that a step has been taken in the right direction by the regatta committee, they should be properly supported.

Four classes filled, and the eleven starters all were sent over an 11½-mile course. The first leg was 4½ miles N.E., the second 3 miles W. by N. ½ N., and the third leg was 4 miles S. by W. The wind was E. N. E. The first leg was a beat, the second a run and the third a reach.

The preparatory was given at 2:30, and 10 minutes later Alert and Mimosa started. Alert, handled by Commodore A. K. Alker, crossed 31s. after the signal. It was not a one-gun start, so Mr. T. L. Park took his time in sending Mimosa over. She crossed 1m. 19s. after the signal. Alert showed Mimosa the way to the weather mark. In fact she led all over the course, and was never in danger of losing the race.

The wind was fluky and veered around in a most exasperating manner. When the larger boats were nearing the second mark the wind let up to such an extent that the balance of the race was hardly more than a drift.

Una and Galatea were started at 2:45. Una led over the line and was never headed. She left Galatea so easily that the racing was without interest.

Tomboy led the raceabouts over the starting line at 2:50. Hobo, Idler and Cricket followed in the order named. Cricket pointed high and moved fast, and soon worked from last place into the lead. Cricket worked away from Tomboy steadily, and won by nearly 10m. Idler was third, being far behind Tomboy. Hobo withdrew.

In the third class sloops the starters were Kenoshi, Owatonna and Bairn. The two former belong to the Indian Harbor one-design boats, and the latter is one of the Seawanhaka one-design 15-footers. After rounding the first mark, the regatta committee notified the owners to return to the finish line, as there was not wind enough for them to cover the course. This was done, but the boats were unable to finish within half an hour after sunset, which is the time limit. Kenosha led while the race lasted.

The regatta committee, composed of Messrs. S. Nicholson Kane, Newbury D. Lawton, and Oliver E. Cromwell, with Frank Bowne Jones acting, were on board the tug Unique. The summary follows:

Sloops—First Class—27 to 38ft. Rating—Start, 2:40.

	Finish.	Elapsed.
Alert, A. H. Alker.....	5 18 13	2 37 42
Mimosa III., T. L. Park.....	5 24 50	2 43 00

Sloops—Second Class—22 to 27ft. Rating—Start, 2:45.

Galatea, Anson Phelps Stokes.....	6 45 52	4 00 04
Una, W. Butler Duncan, Jr.....	6 06 04	3 20 27

Raceabout Class—Start, 2:50.

Idler, O'Donnell Iselin.....	7 09 08	4 18 54
Tomboy, H. L. Maxwell.....	6 53 28	4 02 15
Hobo, T. L. Park.....	Did not finish.	
Cricket, H. Willetts.....	6 43 19	3 52 30

Sloops—Third Class—18 to 22ft. Rating—Start, 2:55.

Kenoshi, Charles Mallory.....	Did not finish.	
Bairn, H. M. Mathewson.....	Did not finish.	
Owatonna, George Sander, Jr.....	Did not finish.	

Duxbury Y. C.

Duxbury, Mass.—Saturday, July 2.

A CLUB race of the Duxbury Y. C. was sailed in Duxbury Bay on Saturday, July 2, in a strong S. W. breeze. In the 18ft. class Kittiwake IV. won easily. In the handicap class, Mr. W. T. Whitman was dragged overboard by the main sheet. As You Like It was leading at the time, but went to the assistance of Mr. Whitman and rescued him after considerable difficulty. Neither of the yachts finished, but the prize was awarded to As You Like It. The summary:

18ft. Knockabouts.

Kittiwake V., H. M. Jones.....	1 51 40
Menace, J. H. Hunt.....	1 53 00
Again, L. B. Goodspeed.....	1 53 15
Domino, C. C. Clapp.....	2 00 40
Osprey, A. R. Train.....	Withdrew.

Monday, July 4.

A ladies' day race of the Duxbury Y. C. was sailed Monday, July 4, in a stiff S. W. breeze. Menace won easily in the 18ft. class, the only one to fill. The summary:

	Elapsed.
Menace, H. H. Hunt.....	1 41 40
Kittiwake V., H. M. Jones.....	1 43 50
Again, L. B. Goodspeed.....	1 47 05
Domino, C. C. Clapp.....	1 49 15
Osprey, A. R. Train.....	1 50 25

Saturday, July 9.

A special race of the Duxbury Club was sailed on Saturday, July 9, in which Menace won handily. The summary:

	Elapsed.
Menace, J. H. Hunt.....	2 15 35
Aspinquid II., C. M. Foster.....	2 17 33
Miladi II., F. R. Adams.....	2 18 16
Again, L. B. Goodspeed.....	2 21 15
Kittiwake, F. O. Wadsworth.....	2 27 25
Osprey, A. R. Train.....	2 28 50

Larchmont Y. C.

Larchmont, Long Island Sound—Monday, July 4.

THE twenty-fifth annual regatta of the Larchmont Y. C. was sailed on Monday, July 4, in a fresh S. W. breeze. Although the list of starters was small when compared with that of previous years, still the racing in the classes that filled was good. Strange to say, no schooners started, and the largest single sticker to go over the course was the 51-footer Altair.

In the morning there was but little air stirring. Soon after 11 o'clock, however, a nice breeze struck in from the S. W., and the regatta committee, finding it was going to hold, decided to start the race at noon.

Boats in Class K and M sailed twice over an 11-mile triangle. This first leg was E. 4 miles, the second S. W. 4 miles and the third N. N. W. 3 miles. The first leg was a broad reach, the second a beat and the third a broad reach, so broad in fact, that some of the boats were able to carry spinnakers.

At 12:15 boats in Classes K and M started, and the starters crossed in the following order: Spasm, Anokatok, Mimosa III., Altair and Tern. The cutter Altair and the yawl Tern were alone in their respective classes, both took sailovers, and the regatta committee stopped Tern at the end of the first round.

Mimosa III., a new Herreshoff production, owned by Mr. Trenor L. Park, had no trouble in beating Spasm and Anokatok. Mimosa III. is almost identical to Onward, a well-known Herres-

hoff boat. She was built for Mr. C. S. Eaton this spring, and is 47ft. over all, 30ft. waterline and 7ft. 6in. breadth. This was her maiden race and she beat Spasm 4m. 27s. Spasm beat Anokatok 8m. 19s.

Alert, Bobtail and Mimosa were the starters in Class N, they started in the order named. Alert had a big lead on her competitors at the end of the first round and won easily. The raceabouts was the only class that made a good showing in so far as the number of starters was concerned. Ten boats started. Tartan and Tom Boy were in a class by themselves, and in all probability Tartan would have won had she not broken her throat halliards on the windward work on the second round. Tom Boy beat Rascal II., the second boat, by over 1m. Hobo was third. In Class P, Una had no trouble in beating Miss Judy. Snapper, the third boat to start, did not finish. Vaquero won in the Larchmont one-design class. Adelaide was second.

Only two of the Indian Harbor raceabouts started. Kenoshi won, but she was protested by Anawanda. The race in Class Q lay between Gazabo and Jeebi, as Skip did not finish. Gazabo won easily.

Ace, one of the New Rochelle one-design boats, started against Scoot and Plover in Clas R for sloops. Ace beat Plover and Scoot did not finish.

Of the four starters in the Manhasset Bay one-design class, Bab had the best of it and won easily. Pup was second. The regatta committee was composed of Messrs. Charles P. Tower, chairman; T. S. J. Flint and Howell C. Perrin. The summary follows:

Class K—Sloops, 51ft.—Start, 12:15—Course, 22 Miles.

	Finish.	Elapsed.
Altair, Cord Meyer, Jr.....	3 11 49	2 56 49

Manhasset Bay Raceabouts—Start, 12:40—Course 11 Miles.

Manhasset Bay Challenge Cup Series.

Port Washington, Long Island Sound.

Fifth Day—Tuesday, July 5—Third Race.

The third and last race of the series was sailed on Tuesday. The series had been prolonged to such an extent by calm weather, that less interest was taken and only two boats competed in the last event—Alert and Mimosa. Although Alert won the race easily, Mimosa gets the cup on points. The other two challengers, Nike and Bobtail, did not start. The former did not put in an appearance. The latter was on hand, and why the boat did not at least cross the starting line is a mystery.

Mr. Alexander M. Orr, Jr., was the only one of the race committee on the steam yacht Florence, and he was in charge of the match. The race was over a windward and leeward course and a fresh S. W. wind held throughout. The start was made off red and black buoy off Execution, thence to and around the red spar buoy off Parsonage Point and return—a distance of 9½ miles which was covered twice, making a total distance of 18½ miles. Mimosa was sailed by her owner, Mr. T. L. Park, while Alert was handled by Mr. Herman Duryea.

The boats were started at 1:55, and Alert led over the line. It was a run to the first mark with spinnakers to starboard. Mimosa proved the better boat on this point of sailing and led Alert 15s. at the Parsonage Point mark. On the beat back to the starting line Alert demonstrated her superiority on windward work and passed Mimosa on her weather. From that time on Alert was never headed and, barring accidents, could not lose. The times at the end of the first round were: Alert, 3:44:38; Mimosa, 3:44:58. Alert was leading by 15s.

On the first leg of the second round Alert increased her lead and widened the gap between herself and Mimosa. At the leeward mark on the second round the times were: Alert, 4:24:15; Mimosa, 4:25:56. Alert was leading by 1m. and 41s.

The wind freshened on the last leg, and Alert, sailing in nice shape, left Mimosa fast. Alert allowed Mimosa 4m. 53s. Alert beat Mimosa 9m. 50s. elapsed time, and 4m. 29s. corrected time. The summary follows:

	30-Footers—Start, 1:55.	Finish.	Elapsed.	Corrected.
Alert	5 27 11	2 32 11	3 32 11	
Mimosa	4 36 31	3 41 31	3 36 38	

On the point system Mimosa wins the cup. By this plan each boat gets a point for starting and one for every boat she defeats. With only two starters in the last event it was obviously impossible to prevent Mimosa from winning the cup on points. The standing in points of the four boats follow:

	Points.
Mimosa, Trenor L. Park, American.....	8
Alert, James W. Alker, Manhasset Bay.....	7
Bobtail, E. F. Luckenbach, Atlantic.....	4
Nike, Victor I. Cumnoch, Seawanhaka-Corinthian.....	3

The cup now is in the hands of the American Y. C., and it will be defended by that organization next season in races that must take place, according to the condition, between June 15 and September 15.

Boston Y. C.

Marblehead, Mass.—Saturday, July 9.

The first of the Marblehead series of races of the Boston Y. C. was sailed off the Marblehead station of the club on Saturday, July 9, in a wholsail, S. E. breeze. In the 30-footers Chewink IV. led from the start. In the 22-footers Clotho got the start, but Medric took the lead at the first mark and was never headed. Clotho was second around the course, with Opitsah V. third. In the 18-footers, the boats went over the line in a bunch. Bat soon went into the lead and finished in her usual place. In the first handicap class, Jingo, a 25-footer, and Opitsah III., an old Y. R. A. 21-footer, both beat out the Buzzards' Bay 30 footer, Mashnee, on elapsed time. Scapegoat led around the course easily in the second handicap class, but Widow took first place on corrected time. The summary:

	Class C—30-Footers.	Elapsed.

Indian Harbor Y. C.

Greenwich, Long Island Sound—Monday, July 4.

A heavy S. W. wind, accompanied by a nasty sea, spoiled the power boat races held by the Indian Harbor Y. C. on Monday, July 4. The feature of the event was to have been the racing between Shooting Star, Vingt et Un and Challenger. The boats were not built for racing in rough water, and the conditions were so unfavorable that Shooting Star and Challenger withdrew.

The three cabin boats, Allure, Queen Bess and Suis Moi, raced in the morning. These boats covered a 10-mile course. The start was made off the club house, thence to and around Little and Great Captain's Islands and back to the starting line. Suis Moi won on corrected time. As a result of a protest made by the owner of Queen Bess, the winning boat will be remeasured.

A number of the automobile boats, entered for the race, did not start on account of the rough water. Of the three starters in this class Challenger was the scratch boat. Over a 15 mile course Vingt et Un received 7m. 26s. and Shooting Star 21m. 7s. Challenger and Vingt et Un are the American entries for the Harmsworth cup, which will be raced for on July 30 on the Solent. Both boats were designed by Messrs. Tams, Lemoine & Crane and are almost identical in design. Vingt et Un is equipped with a 75 horse-power Smith & Mabley engine, while Challenger is fitted with an engine of the same make of 150 horse-power. Challenger was handled by Mr. Clinton H. Crane, and Mr. Claire M. Hamilton steered Vingt et Un.

Vingt et Un led over the starting line, Shooting Star was a few feet behind, Challenger was last. The water was so rough that the boats were smothered, and in order to prevent their filling, the motors were slowed down. Vingt et Un steered erratically in the seaway, being of such light draft she was hard to control. Shooting Star and Challenger withdrew at the end of the first round, leaving Vingt et Un to finish alone.

In the open launch class Lucia and Scooter were the only starters. These boats covered a 5 mile course. Lucia won, but was protested by Scooter for covering the wrong course. The regatta committee was made up of Messrs. Frank Bowne Jones, chairman; Charles E. Simms and Charles E. McManus.

The summary follows:

	Cabin Motor Boats—Course, 10 Knots.	Start.	Finish.	Elapsed.	Corrected.
Allure, Alex Stein.....	12 01 03	12 55 36	0 54 32	0 54 32

Scooter, A. J. McManus.....	5 05 00	0 50 00	0 50 00	

Edgewood Y. C.

Narragansett Bay, R. I.—Monday, July 4.

The second and third races in the series of three for the Possner cup of the Edgewood Y. C. for 30ft. cats were sailed on the afternoons of Monday, July 4, and Saturday, July 9. Both races were taken by the Mblem, which gives her owner, George E. Darling, possession of the trophy for a year, or permanently, if he wins next season's series with Mblem.

In Monday's race there was a spanking two-reef breeze from the S. The strain broke the Clara's headstay on the third round, and the boat withdrew. The same mishap befell Elizabeth, which was in second place at the time; but after dropping sail for about 10m. and tightening things up a bit, she went on after the others and succeeded in finishing third. It was Mblem's race almost from the start, and the affair became a procession. Mblem winning by 10m., about the same margin by which she was defeated by Elizabeth in the first race of the series.

Saturday, July 9.

In the third and final race on Saturday there was another procession, Mblem taking the lead again soon after the start, and the relative positions of the boats being practically unchanged to the finish. Mblem won by 3m., Elizabeth taking second place, with Scott a close third. Wanderer III. made a poor showing in all three races. She had been launched only a week at the time of the first race, and there had been no opportunity to give her a tuning up. She behaved badly, steering hard, on Monday, and finished at the tail end of the procession, over 15m. behind the winner. Mr. B. B. Crowninshield, her designer, advised moving the mast forward, and this was done, the step being shifted about 8in. This gave her a better balance, having less sail outboard aft, and she handled rather better Saturday, but still lacked the speed and finished 13m. behind Mblem, in a light wind. She needs more changes of some kind, evidently, and the Flint brothers hope to get her tuned up very soon.

The standing of the 30-footers at the conclusion of the series, according to the Massachusetts Bay Y. R. A. percentage system, was as follows: Mblem, 83 1-3; Elizabeth, 58 1-3; Scott 25; Wanderer III., 13 1-3; Clara, 5.

The Saturday race was also a special club regatta, and there were four other classes besides the 30-footers. The wind was very light at the start, but freshened considerably later in the afternoon, and the boats made fairly good time. The winners were Nobska, Marguerite, Shadow and Gee Gee. The summaries of the two days' races are as follows:

Monday, July 4.

	Second Possner Cup Race—Start, 2:25—Course, 11 Miles.	Finish.	Elapsed.
Mblem, G. E. Darling.....	4 36 45	2 11 45	
Scatt, H. B. Scattergood.....	4 46 50	2 21 50	
Elizabeth, W. D. Wood.....	4 50 12	2 25 12	
Wanderer III., H. J. & D. W. Flint.....	4 52 28	2 27 28	
Clara, W. Benns.....	Disabled.		

Saturday, July 9.

F. H. Young.

Riverton Y. C.

Riverton, Delaware River—Monday, July 4.

The fortieth annual regatta of the Riverton Y. C. was sailed on July 4. A fresh S.W. breeze gave the boats all the wind they wanted. The boats covered triangular courses.

The preparatory was given at 10:30, and the catboats were sent away 5m. later. Carolyn II. had a long lead, but broke down on the third leg, and withdrew. Sea Gull won, beating Fiona by a few seconds.

In the one-design class A. G. Cook, in No. 1, took the lead at the start and held it for the first half of the race, but H. McIlvaine Biddle passed him on the third leg and led the fleet home.

In the afternoon the races for power boats were held. Clarence Godschalk in his automobile boat, Nada, after chasing J. H. Basley's launch, Red Devil, once round the course, overhauled her, and in the second leg won out easily.

The summary:

	Catboats—Start, 10:35.	Finish.	Elapsed.
Sea Gull, S. A. Cook.....	12 30 15	1 55 15	
Tiona, J. Perkins.....	12 31 58	1 56 58	
Priscilla, P. C. Clarkson.....	12 30 10	2 03 00	
Carolyn, H. C. Rianhard.....	Disabled.		

	One-Design Boats—Start, 10:40.	Finish.	Elapsed.
No. 3, H. MacIlvaine Biddle.....	12 18 35	1 38 35

Red Devil, Balsley.....	Did not finish.		
Spark, Haines.....	Did not finish.		

Bensonhurst Y. C.

Bensonhurst, L. I.—Saturday, July 9.

ONE of the best open regattas of the season was given by the Bensonhurst Y. C. on Saturday, July 9, over courses in Gravesend Bay. Twenty-six boats started, all but two of which finished. The winners were Maydic (ex-Umbria), Bobtail, Lizana, Ogeemah, Cayuga and Martha M. Corrected times were not figured out because of a lack of measurements of some of the racers. As near as can be determined without the final data, however, the boats getting first honors in classes where time is allowed were as stated above. Beta and Kelpie, sailing in one-design classes, were sure winners.

A fine S. E. breeze blew throughout the race. The boats in Class M went out to Old Orchard Shoal and returned from the start off Ulmer Park leaving all marks to starboard. This made a 12-mile course, over which Maydic signalled her first appearance of the year by handily defeating Vivian II and Redwing. She was 5m. and 36s. in the lead at the finish. The boats had a reach both ways.

In the class for 30-footers, Bobtail led Bagheera at the finish

by 2m. and 53s. The course gave the boats a reach to the mark off the Atlantic Y. C., a spinnaker run to Craven Shoal buoy and another reach to Port Hamilton. Then came a close hauled board to the stake boat off the Marine and Field Club and good windward work to the start. The journey was sailed twice, making an aggregate distance of about 9 miles.

The other starters sailed the same course, with the exception that the second leg led from the Atlantic Y. C. directly across the bay to Port Hamilton instead of out to Craven Shoal buoy. This was a run with spinnakers set to starboard. Among the smaller craft Lizana did fine work in Class P, defeating Bonita, a boat brought down from one of the higher classes by the new rule, by 1m. and 27s. elapsed time. The fight in the catboat class was very close and exciting, Martha M. winning out only just before the finish. The race was sailed with very few flukes and was a success in every way. The summary:

	Sloops—Class M—Start, 3:05.	Finish.	Elapsed.
Maydic, ex-Umbria, W. H. Childs.....	4 58 44	1 53 44	
Vivian II., S. E. Vernon.....	5 04 20	1 59 20	
Redwing, J. B. O'Donohue.....	5 09 34	2 04 34	
Bonnie Kate, A. C. Bellows.....	Did not finish.		

	Sloops—Class N—Start, 3:05.	Finish.	Elapsed.
Bobtail, E. F. Luckenbach.....	4 36 47	1 31 47	
Bagheera, Hendon Chubb.....	4 39 40	1 34 40	
Era, ex-Vivian, E. H. M. Roehr.....	4 41 00	1 36 00

Riverside Y. C.

Riverside, Long Island Sound—Saturday, July 9.

THE sixteenth annual regatta of the Riverside Y. C. was sailed on Saturday, July 9. A fresh S.E. breeze made the racing in the five classes that filled conclusive. There were twenty starters, and all the boats finished.

The sloop Mimosa III. and the yawl Memory sailed a match race over an 18-mile course. Mimosa beat Memory 13m. 39s.

The six raceabouts that started covered a 14½ mile course. Tartan beat Idler, the second boat, 5m. 15s.

The three sloops in the 25ft. class also covered a 14½-mile course. Robin Hood finished first, but she had to allow Firefly 4m. 44s., and she lost the race on corrected time.

In the Larchmont one-design class Dorothy won easily. Adelaide got second place, beating Vaquero 16s.

Wawa won in the Indian Harbor one-sign

Erie Yacht Club.

Erie, Pa.—Monday, July 4.

The club held its first race for the season on July 4. The boats were started in classes, the first class starting at 9:30 A. M. and each class following at intervals of 3m. All boats had to be sailed by their owner or a member of the club and could start either from a mooring or its anchorage, as preferred. A prize was given to one boat in each class.

The next race will be sailed next Saturday, July 9.

This race to-day was sailed in what the Washington Weather Bureau told us was a "southwest storm," but while there was a high wind, there was not too much of it.

Several of the big boats were missing; they had gone up the lake to hunt races at Detroit. The first class was taken by Flora; time 1.21. Viking, Nameless and Morrita sailed in the next class. Nameless came in an easy winner. Kingfisher and Caprice were in the next class; Kingfisher won in it. Zephyr ran away from Phyllis in the fourth class race. Turtle did the same to Mingo in the fifth class, and the boats that should have sailed in the sixth class were missing—gone up the lake to hunt races away from home.

Another of the fleet that was missing to-day was the unfortunate Tonkawa that burned at Conneaut on the night of June 30. She should have given a good account of herself from her looks, but never had a chance to try.

CABIA BLANCO.

Rhode Island Letter.

PROVIDENCE, R. I., July 9.—The most important racing event in general on this side of the water during the past week has been the one of special interest to Rhode Island yachtsmen, as a matter of course. Not a man or a woman in this State that takes pleasure in sailing and that keeps somewhat in touch with leading events in yachting circles, but that felt pride and satisfaction in the announcement that Little Rhody had won the Brooklyn Y. C. ocean race from New York to Marblehead, Mass., and had captured the 100 guinea trophy offered by Sir Thomas Lipton. Members of the Bristol Y. C., of which Capt. Charles F. Tillinghast is vice-commodore, and which club the little craft represented in the ocean race, when they heard the news early Tuesday morning, promptly went out and attached a new broom to the Little Rhody's vacant mooring buoy in front of the club house and decorated the affair with red, white and blue bunting. All the colors were run up on the club house, and the members immediately began to prepare for some sort of a suitable reception in honor of their victorious vice-commodore. This took place at the club house this (Saturday) evening, and was a gala affair, taking the form of a congratulatory reception and a banquet. There was a very large attendance of members and invited guests, a number of speeches of congratulation were made, and the complimentary things said of Little Rhody, her owner and her crew, were without number. Capt. Tillinghast responded by thanking his fellow club members for their expression of appreciation, and in lieu of a set speech, he read to them the official log of the Little Rhody during the memorable race. This was the most appropriate feature that could have been introduced at such an affair, and it was received with enthusiasm. The log will be kept among the club's most cherished possessions.

Scarcely second to the pride felt by Bristol Y. C. members in Little Rhody's achievement was the general satisfaction expressed by members of the Rhode Island Y. C., in which the winning craft is also enrolled. In fact, every one in the State who is interested in yachting, was gratified by the boat's victory. The result was in every sense a victory for Rhode Island, and peculiarly so, for not only does the boat bear the nickname of the State, but she was designed by George Owen, of Toronto, Canada, who was born in and lived in Providence all his life until within the past two or three years. She was built by Rhode Island men in the shops of the Chase Pulley Company, in this city, and she was manned by a crew of Rhode Island amateur yachtsmen. It was a triumph of Rhode Island designing, building and seamanship; perhaps especially the latter, as a few errors in navigation might have lost the race for Capt. Tillinghast, for the skill of some of his competitors is unquestioned.

The crew of Little Rhody in the race comprised Capt. Tillinghast, Mr. George Owen, her designer, and Messrs. James H. Thurston, Irving O. Hunt, George A. Fuller and S. Foster Hunt, the last named being the navigator, a graduate last month of Brown University, where he took a course in marine engineering and navigation.

Little Rhody beat Newasi, the second boat, by 2h. 52m. actual time, and by 5h. 41m. corrected time.

Little Rhody was built last spring, and had already achieved some fame for speed before she started on the ocean race, having defeated Pricilla, one of the fastest sloops on Narragansett Bay, a boat built purely for racing, in one of the closest and most exciting contests ever seen in these waters. Little Rhody, moreover, notwithstanding the criticism that may have been passed upon her by prejudiced observers, is a stoutly constructed and extremely able boat, the aim of her designer being to produce an entirely seaworthy cruiser.

After this 330 mile test in the open Atlantic, Capt. Tillinghast is satisfied with her cruising qualities, and says that he would be willing to take her anywhere along the Atlantic coast within a reasonable distance of the land, and is convinced that she would stand any weather test that would permit any of her recent competitors to pass through unscathed.

Little Rhody is 34ft. 6in. over all; 21ft. 9in. waterline; 8ft. 6in. beam, and 5ft. 6in. draft. She is a pole mast, sloop-rigged, keel boat, with about 3000lbs. of outside ballast. The frame and floorings are of white oak, and her planking is double, being of cedar inside, with an outer skin of hard pine. The cockpit is water-tight, and is double-planked with white oak. The fastenings are all of bronze, brass and copper. The cabin trunk is moderate, affording comfortable head room below. The after end of the cabin and the companion hatch are of mahogany, and the finish below is in buttternut. On the ocean race Little Rhody carried the full cruising equipment and supplies, as provided in the rules, and in addition to the ordinary working sails, she carried two spinnakers, a balloon jib, a storm jib, a small topsail and a storm trysail.

F. H. YOUNG.

British Letter.

THE seventh race for the German Emperor's cup from Dover to Heligoland, which was started on June 18, has been chiefly remarkable for three things. Firstly, it was this year turned into an international race instead of being, as hitherto, confined to British yachts only; secondly, it was sailed in much faster time than any previous contest; and lastly, the handicapping was in some cases so extraordinary that the match would have been quite conspicuous for that reason alone. The American schooner Ingomar was placed—and rightly so—at the scratch, but the amount of time she was called upon to give some of the others was out of all reason. For instance, it is impossible to conceive the kind of conditions under which she could allow such a fine vessel as Brynhild as much as five hours, or Bona two and a half. Bona was not considered to fulfill the description of a bona fide cruiser, so she was not allowed to start. Had she been in the race, however, there is but little doubt that she would have been very close to Ingomar at the finish, as most of the course was sailed under spinnakers. It is doubtless a very difficult task to handicap such a scratch lot of vessels as take part annually in this particular race, but it would surely not be very difficult to improve upon the allowances that were drawn up for this year's match. Like Brynhild, the winner Valdora was in receipt of a ridiculous amount of time—no less than seven and a quarter hours—from Ingomar, for a straightaway course of 310 miles; but what can be said with regard to Valdora's allowances to such old stagers as Nicandra (formerly Vandura), Fiona, and Vol-au-vent! Take Valdora and Fiona, for instance. The former is one of Fife's latest and best fast cruisers, built only last year, while the Fiona is the old Fawn o' Fairlie, designed and built by Fife's father nearly forty years ago. Yet the old boat received only 35 min-

utes from the smart, up-to-date yawl, equal to about 1 minute in 9 miles. In point of fact, with everything in favor of the slow boats, Valdora was able to beat Fiona nearly 2 hours, and what she would have done with her had there been any turning to windward, or even close reaching, goodness only knows. Fourteen boats started, representing four nations, Great Britain supplying eleven and America, France, and Germany one each. The breeze was light at the start, but freshened the following morning and strengthened up to the finish. There was a good deal of sea and Brynhild broke her spinnaker boom about noon on the 19th. As it was a hollow spar, it could not be spliced, and she had to do half the course without a running sail. This, of course, accounts for a good deal of Ingomar's big lead at the finishing line, for Ingomar was not many miles ahead of Brynhild when the yawl broke her spinnaker boom. The race showed beyond all doubt that Ingomar is a very fast vessel, and she has given further proof of her speed at Cuxhaven and Kiel, while she carries her large sprad of canvas nobly. It is indeed a pity that the Fife schooner Cicely has not been fitted out to meet her, for no other schooner of her size on this side can show anything like sufficient speed to give her a race.

On June 21 there was a regatta at the mouth of the Elbe under the flag of the Norddeutscher Regatta Verein. A fresh northwesterly breeze was blowing, and the big schooners could only carry sharp headed topsails. Four vessels started in the big schooner class, Meteor III., Iduna, Hamburg (ex-Rainbow), and Ingomar. They had a beat down the river of about twelve miles in short tacks, and a run back to Cuxhaven. Ingomar fairly dressed down the fleet in the wind jamming, but did not observe signals which were made to shorten the course, and lost about a quarter of an hour through standing on too far, she being then about a mile to windward of Meteor. It was a most creditable performance in such a strong wind and with such a nasty wash in the river, and it was unfortunate that the racing instructions had not been more carefully read. As it was, Meteor of course won. Hamburg should have made a much better show on such a day, but she is not well sailed or handled and is a very different boat to what she was when she belonged to the late Mr. C. R. Orr Ewing, for whom she was built in 1898, and though at times she gives evidence of greater speed than either Meteor or Ingomar, she can do nothing when laid on a wind, and suffers from inferior handling in other ways.

Kiel Week began, as far as the big boats were concerned, on June 24, when the same four schooners made up the big class. They had a reach to the first mark of about 16 miles, a beat of 8 miles to the second, and a run home. Meteor and Hamburg led Ingomar in the reach, but in the beat Ingomar passed Hamburg and met Meteor, which was on the port tack. Meteor tried to cross Ingomar, which had to come round to avoid a collision. A protest flag was the result, and the German Emperor's vessel at once gave up. It seems an extraordinary thing for an old hand like Parker to be caught napping over such an elementary breach of the rules. On this occasion Ingomar fairly beat the bigger boats to windward, as she did on the Elbe, and she arrived at the line only 10 seconds astern of Hamburg. Ingomar saved her time on Meteor on June 26, and again on June 28 in the race from Kiel to Eckernförde, although it appears that on the last date she was somewhat favored toward the finish by the wind freeing her. However, Mr. Plant has won three first prizes out of four starts in German waters, and his vessel would undoubtedly have won the fourth—that is, the race at Cuxhaven—had the signals for a shortened course been seen, and as all four matches have been sailed in fresh to strong winds against bigger vessels than his own, he has every reason to be satisfied with Ingomar's performance.

Kiel regatta this year has been specially interesting and successful, owing to the additional *éclat* given it by the visit of King Edward VII. and the presence of the two monarchs at the beautiful port during the racing. The Germans are able to muster an immense quantity of yachts at this function, but they make the mistake of splitting them up into too many classes—as many as thirteen or fourteen—with the result that in many there is only one entry, and sails over are frequent. The yawl Orion, formerly the German Emperor's Meteor II., was kept in a class by herself, whereas she might have been run with Brynhild, Navahoe, Comet, etc. Clare has also had to sail over more than once, and so has the new Fife schooner, Susanne.

While there has been so much going on in the Baltic, racing at home has been on the quiet side. On the Solent the usual number of small races have been taking place, and on the Clyde the principal clubs have had their usual handicap matches and small class races, but at neither place has the sport been up to the level of former years. Bona has had one race with Messrs. Connell's new 65-footer Zinita, but it was a paltry, fluky day, each yacht getting the best of the luck in turn, and Zinita having it at the finish, winning easily. For the Clyde Fortnight, Bona, Zinita, Carina, and the new Gosport cutter, Merry-maid, will provide the big class handicaps, and the 52-footers will be there also, while the usual local classes, including the new restricted 30ft. class, will turn up in force. The attractions of Kiel, however, have shown the Clyde Fortnight of much of its pristine glory, and British yacht owners will do well to give more patronage to the sport in their own waters in the future, unless they wish to see the Clyde racing overtaken by the fate which has pretty nearly ruined the Irish fixtures.

E. H. KELLY.

Model Yacht Races.

THE Brooklyn Model Y. C. was invited by the Atlantic Y. C. to participate in their Fourth of July programme, and hold a race for second class model yachts off the club house at Sea Gate. The invitation was accepted, and six yachts and their skiffs were taken down there. After passing a very pleasant day and being entertained at dinner by the Atlantic Club, the race was started at 5 P. M. The wind was very high; in fact, too high for good sport. Five yachts, however, started, and two finished, the others coming to grief one way or another. The usual rules and time allowances were waived. The course was a quarter mile to leeward and return, twice around.

Mr. William Gray was first over the finish line, with

Mr. John Pelly second; Mr. John Fifer would have won the race, owing to Mr. Pelly coming to grief and having to fix up, but his yacht lost her hatch, and was filled by a sea. Now that model yacht sailing has been recognized by the Atlantic club, we hope the other large clubs will fall into line and give to this most interesting and instructive sport their support. A model yacht sailing department would be an advantage and a source of great interest to any of them, and give to their younger non-yacht-owning element something to interest them besides tennis and piazza amusements.

YACHTING NEWS NOTES.

For advertising relating to this department see pages ii and iii.

NEW YORK Y. C. CRUISE.—The squadron will rendezvous at Glen Cove on Thursday, August 11; captains will report on board the flagship at 4:30 P. M. The programme for the cruise, weather permitting, will be as follows:

Friday, August 12.—Squadron run, Glen Cove to Morris Cove.

Saturday, August 13.—Squadron run, Morris Cove to New London.

Sunday, August 14.—At New London.

Monday, August 15.—Squadron run, New London to Newport.

Tuesday, August 16.—Squadron run, Newport to Vineyard Haven.

Wednesday, August 17.—Squadron run, Vineyard Haven to Newport.

Thursday, August 18.—At Newport, 10:30 A. M., races for the Owl and Game Cock colors; 2 P. M., special races for motor boats and for yachts too small for enrollment.

Friday, August 19.—At Newport; Astor cup races. In the evening the squadron will illuminate.

The preparatory signal for squadron runs will be two guns fired in rapid succession by the flagship, and the display at the foretopmast head of the code letter P over the signal indicating the next port. The start will be made promptly one hour later from a line previously established by the regatta committee, at which time the preparatory signal will be hauled down. The regatta committee will issue instructions for the runs from port to port, and for the other racing events. The Commodore's cups will be sailed for during the cruise. Captains are requested to supply their vessels with N. Y. Y. C. night signals. Captains and their guests will be welcome on board the flagship at all times. Particular attention is invited to the routine published in the club book.

NEW ROCHELLE Y. C. SPECIAL OPEN RACE.—The New Rochelle Y. C. will hold a special open race on July 30 from New Rochelle to Stratford Shoal and return. The race is open to cruising yachts of any rig. The contestants must not measure over 40ft. on deck, and must be enrolled in a recognized yacht club.

Yachts built to any special racing class, or that are used solely for racing, or yachts having bulb keel or metal fin, are barred. No restriction on sails carried, except that the lower canvas must be that used by the yacht when cruising. Yachts must be sailed throughout entire race by Corinthian helmsmen.

Time allowance will be given according to length ascertained by adding half of the overhang to the load waterline.

Entries will be received by G. P. Granbery, chairman of the regatta committee, at 114 E. 14th street, New York, up to noon of July 28. The committee reserves the right to reject entries of any yachts not considered eligible to race as cruisers.

The start will be made at 3:10 P. M., indicated by a red ball hoisted on committee boat and gun fired. Preparatory gun will be fired and Blue Peter hoisted on committee boat at 3 P. M.

The course will be from starting line off Echo Bay between committee boat and a mark boat flying the club flag, to and around Stratford Shoal, leaving same to port in rounding, keeping on channel side of all Government buoys, and returning to starting line. In the absence of the judges' boat at the line at finish of race, the yachts are requested to take their own time as they pass the mark boat. Should the race finish during the night, the mark boat will display two white lights hung vertically.

A silver cup has been presented by Mr. Lawrence Dunham, and will be awarded to the winning yacht immediately after the finish of the race.

PHILADELPHIA CORINTHIAN Y. C. CRUISE.—The fleet of the Corinthian Y. C. will rendezvous for the annual cruise at Glen Cove, Long Island, N. Y., on the afternoon of Friday, July 29, 1904. A meeting of captains will be held on board the flagship at 8:30 P. M. The routine and rules contained in the club manual will be observed during the cruise. Squadron runs: Prizes have been offered for port to port runs for yachts in cruising trim, and when four or more start, a second prize to be awarded. The commodore has offered a cup to the yacht in each class winning on corrected time the greatest number of runs.

Saturday, July 30.—Glen Cove to Oyster Bay.

Sunday, July 31.—Fleet to remain at anchor at Oyster Bay.

Monday, August 1.—Oyster Bay to Morris Cove.

Tuesday, August 2.—Morris Cove to Shelter Island.

Wednesday, August 3.—Shelter Island to New London.

Thursday, August 4.—Fleet to remain at anchor. Gig and dinghy races for yachts' crews, and races for small boats belonging to yachts of the fleet, will be held in the afternoon. Entries to be made to the fleet captain.

Friday, August 5.—New London to Newport.

Saturday, August 6.—Disband.

Captains intending to join the cruise will kindly notify the fleet captain, No. 511 Bullitt Building, Philadelphia, at as early a date as possible.

The commodore particularly requests that as large a number of yachts will participate in the cruise as possible, as there are handsome prizes offered for all runs in all classes. By order of the commodore, Charles H. Brock, fleet captain.

Smith's Falls C. C.

ENTER the Rideau River at Kingston, Ontario; pass for sixty miles through a bewilderingly entrancing succession of river and lake, and the voyager arrives at the pretty, active little Canada town of Smith's Falls, of about six thousand inhabitants, and the home of the Smith's Falls C. C. Sixty miles further along the same route or about one hundred and twenty miles from Kingston, lies Ottawa, the capital city of the Dominion. Between Kingston and Smith's Falls this waterway consists of a chain of twelve beautiful lakes, connected by charming bits of winding river. The river portions are made navigable for boats of 110 ft. in length and 6 ft. draft, by a system of locks built in the early part of last century by British military engineers. The quaint, strongly-built stone lock-houses, loop-holed for musketry, remind us that this was once looked upon as an important military waterway.

The lakes vary in depth from forty to three hundred feet; gamy bass are plentiful, and in the cool recesses

Home of the Smith's Falls Canoe Club.

of the greater depths lurk goodly numbers of portly salmon trout. Ten, twelve, and even fifteen-pounders are by no means rare. To the canoeist the Rideau Route is a region of pure delight; to the angler-canoeist, an earthly paradise.

The people of Smith's Falls are fully alive to the charms of this playground at their doors, and the shores of the Rideau are thickly dotted with the pretty cottages which constitute the homes of many of them in vacation times.

Curiously enough, until recently the large fleet of river craft in Smith's Falls contained very few canoes, but the owners of these few were enthusiastic champions of the craft whose graceful lines allow its entrance into Nature's most idyllic scenes with no impairment of the harmony of the picture.

Not until 1901 did there exist in the town any organization for the purpose of furthering aquatic sports or bringing together in a social way the devotees of the paddle. A few energetic paddlers set to work to organize, and at a meeting held April 1, 1901, launched the Smith's Falls C. C., electing the following officers: Hon. Com., Senator F. T. Frost; Hon. Vice-Com., F. Weber Ashe; Com., J. R. Lavall, M. P.; Vice-Com., R. J. Brodie;

Mr. W. E. Mills was elected to fill this vacancy. Before the opening of the season the club was deprived of the services of their energetic and capable captain, Mr. E. I. Scott, who removed to engage in business in Sault Ste. Marie. Mr. Scott was looked upon as "the father of the club," had been foremost in everything pertaining to its welfare, and his loss was keenly felt, indeed. Mr. S. W. Gilroy was elected as club captain in Mr. Scott's place, and when the river opened up the boys started their second season's work, having now purchased a new and up-to-date war-canoe. They also went in for singles, doubles and fours, using cruising canoes, as none of the members as yet owned a purely racing craft.

That they practiced faithfully and well is evidenced by their record at the big meet of the A. C. A. North Division, held at the Mississippi Lake, Carleton Place, on June 28 and 29. There was an immense list of entries in all events. The following clubs sent large representative contingents: Grand Trunk Boating Club, of Montreal; Toronto C. C.; Y. M. C. A., of Brockville; Bohemian C. C., of Brockville; Britannia C. C., St. Lambert's C. C., Carleton Place C. C., Lachine C. C., Smith's Falls C. C. At this time the Smith's Falls C. C. had existed for only fourteen months. Yet in competition with eight other crews, composed largely of veteran canoeists, they won the mile championship after a terrific race in record time. They also took second place in the half-mile war-canoe race with a turn, for the Carleton Place trophy, being beaten only by a few feet by the renowned Grand Trunks. Second place in the green fours, and the half-mile singles also fell to the lot of members of the club—a satisfactory record for these young and untried paddlers, in view of the fact that the course on the Mississippi Lake was very rough, so much so that several races had to be cancelled by the regatta committee, as canoe after canoe was swamped as rapidly as launched. The Smith's Falls practice course is a winding stretch of river as smooth as a mill pond, and rough water was an entirely new problem for them.

Training was resumed with the intention of attending the international meet at Cape Cod, but finding it impossible to make satisfactory arrangements with the railroads for transportation of men and canoes, the trip was abandoned. Instead they attended the Canadian Canoe Association meet at Britannia Bay, Ottawa, but with a crew trained for mile distance only, failed to land the C. C. A. championship race, which is a half-mile event.

Early in 1903 the executive committee began an active campaign to produce a suitable home for the Club, the lack of which had proved to be a very serious obstacle to keeping up interest in the organization. Too much praise cannot be given to the active paddlers who had stuck loyally to their work under most trying conditions. Their old quarters did not provide even space for lockers, to say nothing of rubbing tables. Their faithful trainer, Mr. Geo. Russell, worked under great disadvantages, but his enthusiasm never flagged.

The surmounting of so many obstacles, and the successful struggle against unfavorable financial conditions, have solidified the organization and created an *esprit de corps* which is perhaps the most favorable asset of the club today.

The new club house was completed and formally opened on Labor Day, September 7, 1903. It is a modest, inexpensive structure, but admirably designed for the wants of the club, utility and comfort being the first con-

SMITH'S FALLS' WAR CANOE.

Captain, E. I. Scott; Sec'y-Treas., Murray Lister. Some forty-five members were enrolled the first season. A second-hand war-canoe was purchased from the Ottawa C. C., and Club Captain E. I. Scott undertook the work of coaching a crew for the C. C. A. meet to be held at Brockville, on the St. Lawrence, that year. A cheap boat house was acquired for the housing of the canoe, and these very modest and inadequate quarters continued to be the home of the canoe club until the end of last season, 1903.

The war-canoe crew with their out-of-date boat and their lack of experience did not, of course, dream of winning any prizes at their first appearance in a race, but with that spirit of genuine sportsmanship which has happily characterized the members of the club from the beginning, they wanted "to get into the game," and were quite satisfied with their performance at Brockville in 1901, although they did not win any prizes. They were getting experience which was to help them out in their next season.

At the annual meeting in March, 1902, Mr. Murray Lister resigned the office of secretary-treasurer, which he had filled to the greatest satisfaction of the members.

siderations. On the morning that the splendid flag presented by Commodore J. R. Lavall, was first flung to the breeze, the building committee received many congratulations from the crowd of interested members and friends who inspected the new home of the club.

In the afternoon a very successful regatta was held, and in the evening some three hundred guests attended the first dance of the club. The entire day was a huge success, and was, indeed, a red-letter day in the brief history of the S. F. C. C.

A large proportion of the cost of the club house has already been paid, chiefly through the sale of life memberships. The future looks very bright. Already plans for the coming season have been made. Afternoon and evening regattas, moonlight runs by the club fleet, war-canoe cruises to Oliver's Ferry, nine miles distant; "camp-fires," illuminated flotillas, bonnet hops, etc., have taken form. The club at present owns three 30 ft. war-canoes and two 20 ft. fours. The number of pleasure canoes owned by members is large and steadily increasing.

The growth of this club is an object lesson to very many towns situated similarly to Smith's Falls, as regards population and location. Its success has not been brought

about through the energy and large financial assistance of two or three members, but is directly due to the unselfish loyalty of the rank and file of the organization. The fees have been kept as low as possible; every gentlemanly young fellow is welcomed to membership. A spirit of manly sportsmanship, whether in victory or defeat, has been inculcated and steadily fostered by the guiding spirits, and as a result the club is winning a high place in the affection and respect of the citizens at large, who take a pride in it as a representative local athletic association. An auxiliary force of the greatest value is provided by the lady friends of members. Their devotion to the interests of the club has been unbounded from the first.

At present the club has a membership of 112, and a large increase is this year looked for. Mr. W. E. Mills, the popular and indefatigable secretary of the club, will be pleased to give any desired information to those interested in the formation of a club, or for the providing of inexpensive quarters along the lines of the S. F. C. C.

This season the executive will make a supreme effort to bring within the fold every lover of the canoe, whether he be a keen racing man, intent only on the winning of cups and trophies, or a nature-loving enthusiast, whose delight is in narrow, winding, tree-hung channels, water-lilies, purple iris, or the brooding moonlit silence of the beautiful Rideau.

All communications for FOREST AND STREAM must be directed to Forest and Stream Pub. Co., New York, to receive attention. We have no other office.

Rifle Range and Gallery.

Presque Isle Rifle Club.

Erie, Pa., June 25.—Only six of the club members were present to-day, but they did some good work. Scores:

W A Parker.....	77 75 72—224	J Almeda	73 71 70—214
J A Ackermann.....	76 75 68—219	J Bacon	70 70 70—210
J Stidham	72 72 72—216	G E Shafer.....	74 70 65—209

July 2.—The club held a very successful shoot to-day, though a rather high west wind blew all afternoon. Scores:

J F Germann.....	83 76 75—234	J Bacon	72 55 65—202
A Mount	83 74 70—227	E D Allen.....	69 68 63—200
J Stidham	78 74 62—214	W W Jordan.....	44 39 35—118

CABIA BLANCO.

Trapshooting.

If you want your shoot to be announced here send a notice like the following:

Fixtures.

*July 13-14.—Scottsdale, Pa., Rod and Gun Club.
 July 19-20.—Shamokin, Pa., Gun Club midsummer shoot. S. C. Yocum, Sec'y.
 July 19-22.—Cincinnati, O., Gun Club annual handicap; \$2,200 added money and guarantee purses. A. B. Heyl, Sec'y.
 July 20-21.—Armada, Mich.—Tournament of the Eastern Michigan Gun Club; \$100 added. E. W. Sutton, Sec'y.
 July 21.—Rockville, Conn.—Fourth Consolidated Gun Club of Connecticut tournament. F. Elliott Metcalf, Sec'y.
 July 27-28.—Grand Forks, N. D.—The Interstate Association's tournament, under the auspices of the Grand Forks Gun Club. W. M. Ferguson, Sec'y.
 July 29-30.—Newport, R. I.—Aquidneck Gun Club two-day tournament. J. S. Coggeshall, Sec'y.
 Aug. 9-10.—Litchfield, Ill.—Consolidated Trapshooters' Congress.
 Aug. 9-10.—Raleigh, N. C.—North Carolina Trapshooters' Association tournament.
 Aug. 9-10.—Birmingham, Ala.—Alabama tournament.
 Aug. 9-12.—West Baden, Ind.—Indian tournament; \$1,000 added money.
 *Aug. 10-11.—Bradenville, Pa., Rod and Gun Club.
 Aug. 11-12.—Olean, N. Y., Gun Club two-day tournament. B. D. Nobles, Sec'y.
 Aug. 10-12.—Brantford, Ont.—Dominion of Canada Trapshooting and Game Protective Association's fourth annual tournament. A. B. Cutcliffe, Sec'y.
 Aug. 15-20.—Buffalo, N. Y.—New York State shoot.
 Aug. 23-24.—Chattanooga, Tenn.—Target tournament of the Mountaineer Gun Club; \$200 added. S. B. Lowe, Sec'y.
 Aug. 23-24.—Renovo, Pa.—Recreation Gun Club two-day target tournament. Geo. B. Dechant, Sec'y.
 Aug. 24-25.—Hot Springs, S. D.—The Interstate Association's tournament, under the auspices of the Hot Springs Gun Club. H. A. Gayhart, Sec'y.
 *Aug. 25-26.—Tarentum, Pa., Rod and Gun Club.
 Sept. 5.—Auburn, N. Y.—Labor Day tournament. Knox and Knapp, Mgrs.
 Sept. 5.—Ossining, N. Y., Gun Club fourth annual Labor Day tournament. C. G. Blandford, Capt.
 Sept. 5.—Dover, N. H., Sportsmen's Association annual Labor Day tournament. D. W. Hallam, Sec'y.
 Sept. 5.—Springfield, Mass.—Fall tournament on Labor Day; \$25 added. C. L. Kites, Sec'y.
 *Sept. 6-7.—Irwin, Pa., Rod and Gun Club tournament.
 *Sept. 14-15.—Ruffsedale, Pa., Rod and Gun Club.
 *Sept. 27-28.—Monessen, Pa., Gun Club.
 *Oct. 4-5.—Allegheny, Pa.—North Side Gun Club.
 Nov. 13.—St. Louis Mo.—World's Fair shoot; live birds and targets. Alec D. Mermod, Mgr., 620 Locust street.
 *Western Pennsylvania Trapshooters' League tournaments. C. G. Grubb, Sec'y, Pittsburg.

DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have published. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York. FOREST AND STREAM goes to press on TUESDAY OF EACH WEEK.

The secretary, B. D. Nobles, informs us that the Olean, N. Y., Gun Club will hold a two-day tournament Aug. 11-12.

The New York Athletic Club has resumed its target shooting at Travers Island. Shoots will be held every Saturday hereafter.

In a contest for the English Hotel cup, on the grounds of the Indianapolis Gun Club, July 9, between Messrs. Michaelis and Britton, the former won by a score of 93 to 89. Mr. Hugh Clark, of Wabash, Ind., has challenged the winner.

The Dover, N. H., Sportsmen's Association announces their annual Labor Day tournament, to be held on Sept. 5. Mr. D. W. Hallam is the secretary.

In the main event of the Sheepshead Bay, L. I., Gun Club shoot on June 9, 50 targets, eleven contestants, Mr. L. H. Schortemeier was high with the crack-a-jack score of 48.

Mr. S. B. Lowe, secretary, informs us that the Mountaineers' Gun Club, of Chattanooga, have fixed upon Aug. 23-24 for their annual target tournament. Of added money, he mentions that there will be \$200.

A correspondent informs us that the Rochester, N. Y., Rod and Gun Club will begin a new series of handicaps in a week or two for an elegant silver loving cup donated by the Hunter Arms Co., the event to be called the L. C. Smith handicap.

Mr. John S. Wright, manager of the Brooklyn, L. I., Gun Club, announces a prize shoot for Saturday of this week on the club grounds at Kaiser's farm. Take Kings County Elevated to Crescent street station, thence by hack to the grounds.

Keep in mind that there is a special rate to Cincinnati, for the benefit of annual meeting of the Grand Lodge, Benevolent and Protective Order of Elks, July 15-23. The trapshooters who will attend the Cincinnati tournament can derive the benefit of this rate. Consult your ticket agent for particulars.

Mr. C. G. Blandford, eminent as a skillful shooter and industrious worker in his club's interests, informs us that the regular club shoots will be discontinued for the summer. The Labor Day tournament of the Ossining, N. Y., Gun Club, Sept. 5, will be the commencement of the fall and winter practice.

The first annual tournament of the Awosting Gun Club, of New Paltz, N. Y., is fixed to take place on July 15. Nine of the programme events are at 15 targets, \$1.30 entrance. The third event is for merchandise prizes, 25 targets, \$1.50 entrance. Shooting commences at 11 o'clock. Targets, 2 cents. The competition is for amateurs. The secretary is Mr. G. C. Layton, New Paltz, N. Y.

The third monthly shoot for the Peters silver cup, will be held under the auspices of the Shrewsbury, Pa., Gun Club, on July 21, commencing at 9:30. The programme consists of twelve events, of which ten are at 15 and two at 25 targets, \$1.05 and \$1.75 entrance. Competition is open to all amateurs. High and low amateur averages, \$3 and \$2. Ship shells to the secretary, Mr. W. H. Myers.

At the W. P. T. S. L. at Kane, Pa., July 6-7, Mr. L. J. Squier was high on the first day with 171 out of 175. Mr. Chas. Irwin was second, 164; third, Mr. E. D. Fulford, 163; fourth, Mr. A. Sizer, 161. On the second day, Messrs. Squier and Fulford tied on 167 out of 175; second, Mr. B. D. Nobles, 160; third, Messrs. Irwin, Sizer, Garland, Hart and Millen, 159; fourth, Mr. Brown. Mr. Squier made a run of 118. The five-man team race was won by the Kane team with 92.

At the tournament of the Interstate Association, given for the Winona, Minn., Sportsmen's Club, July 4-6, high average for the three days was made by Mr. C. O. Le Compte, 473 out of 495. Mr. L. E. Parker was second with 470, and Mr. J. L. D. Morrison was third with 465. The Winona team won the La Crosse Chronicle cup, defeating teams of Viroqua, La Crosse and Sparta. Mr. H. C. Hirschy added new fame to his name by skillfully managing the cashier's office.

The secretary, Mr. F. E. Metcalf, Rockville, Conn., informs us that the fourth Consolidated Gun Club tournament will be held at Rockville on July 21. Apply to him for programme. Competition will begin at 9 o'clock. There will be nine events at 10, four at 15 and two at 20 targets, entrance 65 cents, \$1.22 and \$2.30. Targets 1½ cent. The eleventh event will be an eleven-man team race at 20 targets; the competing clubs are New Haven, Hartford, Willimantic, Rockville, Manchester and Waterbury.

The secretary, Mr. Edward F. Markley, writes us that "the Independent Gun Club, of Easton, Pa., will shoot a ten-man team race, 25 targets per man, with the Lehigh Rod and Gun Club, of Bethlehem, Pa., at the latter's grounds at Rittersville, Pa., July 16. The Independent has one match in their favor and one against them with this club, so the outcome of this match will be of great interest to the shooters in this vicinity, as the Independents think their team is the best in this section of the State."

The Aquidneck Gun Club, of Newport, R. I., have fixed upon July 20 and 30, instead of on one day, July 30, as previously announced. A change of programme has been made also. There are nine programme events for the first day, and ten for the second day, at 15 and 20 targets, \$1.05 and \$1.40 entrance. The jack rabbit system will be given a trial. Guns and ammunition shipped, prepaid, care of the secretary, Mr. J. S. Coggeshall, 32 Church street, will be delivered on the grounds. High amateur prizes will be given. On the second day, events 5, 6 and 7—total 50 targets—will constitute a five-man team race.

Mr. James R. Malone, the manager, 2671 Pennsylvania avenue, Baltimore, Md., informs us that the programme of his four-day tournament, Aug. 2-5, will be sent to applicants. Aug. 2, commencing at 4 P. M., will be devoted to practice events, of which there are eight at 10 and 15 targets, 50 and 75 cents entrance. The programme of the second and fourth day is similar: twelve events, of which eight are at 15 and four at 20 targets; \$1.30 and \$1.40 entrance; \$3 added to each event. The third day has a live-bird programme of three events, as follows: No. 1, 5 birds, \$3, moneys 60 and 40. No. 2, 10 birds, \$5, moneys 60 and 40; a gold badge to winner. No. 3, the Love Point Handicap, 20 birds, \$10, three moneys, 50, 30 and 20, and silver cup to the winner. Sweeps are open to amateurs, but the cups and badges are for amateur competition. Competition commences at 10 o'clock. Targets 2 cents. Those who wish may shoot for targets. Each day high average to experts, \$3 and \$2. Shells obtainable on the grounds. Handicaps, birds, 24 to 33yds.; targets, 16 to 20yds. No targets will be thrown over 50yds. Rose system, 5, 3, 2, 1. Guns and ammunition, prepaid and marked in owner's name, care J. Fell Legg, Love Point, Md., will be delivered on the grounds free of charge. For the live-bird championship trophy and the gold badge, the entrance is price of birds.

BERNARD WATERS.

Tanawadeh Outing Club.

NEW YORK.—On the afternoon and evening of July 10 the Tanawadeh Outing Club, of New York, entertained a delegation of members of the Union Sportsman's Club—of Brooklyn at the former's new club house, recently erected at Pelham Bay, N. Y. The building was elaborately decorated for the occasion with flags of all nations, as well as club banners. Festoons of the club colors of the two organizations (crimson and white for the U. S. C., and sky blue and marine for the T. O. C.) appeared conspicuously. Supper was served on the veranda of the club house at 6:30, President Reilly, of the entertaining club, presiding. Later, when cigars were lighted, appropriate toasts were drunk, stories of the rod and gun told and favorite songs sung. Numerous lighted Japanese lanterns, hung completely around the veranda, made a very pleasing effect.

The following members were present: Of the Tanawadeh Outing Club—President F. James Reilly, Vice-President J. Frank Case, Secretary Harry V. Radford, Frank W. Norris, Jr., Charles U. Stepath. Of the Union Sportsman's Club—President William E. Tufts, Secretary Louis W. Dumont, Treasurer James Harper, William E. Dalton, Charles Lodge, Reginald Palmer.

A return shooting contest, including rifle, pistol and shotgun events, has been arranged between the two clubs, and will occur at Homewood, L. I., on July 16. The last interclub shooting match, which was held at Scarsdale, N. Y., in November, was won by the Tanawadeh Outing Club, the trophy being a handsome Japanese bronze statue of a deer and fawn, which at present graces their club house at Pelham Bay.

Dover Sportsmen's Association.

DOVER, N. H., July 9.—It was certainly a beautiful day for our annual Fourth of July contest at targets, and as a consequence good shooting was done by some of our members, who were all native sons, no out-of-town clubs being represented. The scores were as follows:

	Shot at.	Broke.	Per Cent.
Corson	115	103	90
N Wentworth	100	87	87
E Wentworth	90	90	78
Stevens	115	89	77
Beard	75	57	77
Hallam	115	77	67
Fisher	95	65	68
White	100	65	65
Durgin	100	64	64
Mitchell	50	32	64
Hammond	50	25	50
Sowerby	50	23	46
Jones	50	21	42
Roberts	25	12	..
Warren	15	7	..
Abrams	15	6	..
Kelly	25	11	..
Haughey	25	6	..

Team match 25 targets:

Corson 24, Stevens 21, Beard 21, White 18, Fisher 15; total 99.

E. Wentworth 22, Hallam 20, N. C. Wentworth 19, Durgin 16, Mitchell 16; total 93.

Practice shoot, Saturday, July 9:

	Shot at.	Broke.	Per Cent.
Hallam	50	42	84
Stevens	60	47	78
White	80	56	70
Fisher	70	49	70
Durgin	60	43	70
N Wentworth	50	31	62
Jones	70	34	49

D. W. HALLAM, Sec'y.

Rochester Rod and Gun Club.

ROCHESTER, N. Y.—The following are the scores in the final contest for the Watson cup, held July 4, at Rochester Rod and Gun Club grounds. Mr. R. J. Shoemaker, the winner, is a new shooter, having had less than a year's experience, and when the handicap committee arranged the handicaps he was rated at 60 per cent., but he shot exactly 80 per cent. throughout the series, having a walkaway; in fact, he was the only one to finish, as the other contestants had no show, and one by one dropped out.

The final scores follow:

	Brk.	Hdcp.	Tot'l.		Brk.	Hdcp.	Tot'l.
Norton	19	4	23	Shoemaker	22	8	30
Kershner	24	1	25	Donovan	16	4	20
Welles	19	4	23				

Mr. Shoemaker's scores for the series: 28, 25, 31, 31, 28, 26, 25, 30—224, shooting at 25 targets each time, and having his handicap of 8 allowance added.

Ossining Gun Club.

OSSINING, N. Y., July 9.—At the regular bi-monthly shoot of the Ossining Gun Club to-day, but a few events were shot. The best shooting was done by E. F. Ball, who got 23 and 21 out of 25. Bedell succeeded in getting 10 straight in one event, while the best Ward, Stebbins and Blandford could do was 9 out of 10. The regular shoots will be discontinued during the balance of the summer.

Our Labor Day tournament, Sept. 5, will mark the beginning of the fall and winter practice shoots.

C. G. BLANDFORD, Capt.

New York Athletic Club.

TRAVERS ISLAND, N. Y., July 11.—Shooting by the N. Y. A. C. has been at a standstill for a month, but the shooters cannot refrain much longer, as they are turning out one by one. Scores of July 2 follow.

Trophy shoot, bird allowance: Morrison (0) 23, Wilkinson (1)

25, Arthur (4) 22, F. Novotny (2) 22, Cat (0) 19, Perry (2) 18, Pleiss (2) 23, Bazille (3) 20, Irie (2) 23, Allgauer (3) 5, McLaren (5) 19, Bentz (8) 23, Frankel (9) 22, McDermott (11) 21, Bakeman (4) 24.

Wilkinson broke 25 straight and won.

ON LONG ISLAND.

Brooklyn Gun Club.

Brooklyn, L. I., July 4.—Event 1 was for a toilet set. Messrs. Welles and Remsen tied on 25 with a handicap allowance, and the toss up was won by Remsen. Scores: H. S. Welles (4) 25, Leon Goetter (9) 24, H. W. Dreyer (9) 19, G. A. Remsen (7) 25, Davis (9) 21, Brown (9) 22, C. F. Cooper (10) 22, H. J. Montanus (8) 22.

No. 2, for a fish rod: H. S. Welles (4) 24, Leon Goetter (9) 25, H. W. Dreyer (10) 19, Winter 25, C. F. Cooper 20, H. J. Montanus (8) 25, Grinnell, Jr., (10) 24, Davis (9) 25, G. A. Remsen (4) 23.

Shoot-off, 15 targets: Goetter (5) 12, Winter (5) 13, Montanus (4) 12, Davis (5) 13.

Second shoot-off: Winter 0, Water 6, Davis 7.

Event No. 3, a compass was the prize: H. S. Welles (4) 19, L. Goetter (9) 22, H. W. Dreyer (4) 21, G. A. Remsen (4) 21, Davis (9) 25, Brown (9) 17, C. F. Cooper (10) 21, H. J. Montanus (8) 22.

Sheepshead Bay Gun Club.

Sheepshead Bay, L. I., July 7.—The preliminary was at 25 targets, in which Mr. Geo. Kelly was high with 23.

The main event was at 50 targets, and was won by Mr. L. H. Schortemeier, with the excellent score of 48. He made a run of 34 in this event. The scores were as follows: Schortemeier 48, R. Dede 23, H. Kracke 26, C. Cooper 21, H. J. Montanus 35, Capt.

DUPONT SQUAD.

The Dupont Squad shot through the entire programme of the Grand American Handicap, 1904. Reading from left to right: Victor du Pont, 3d; Eugene du Pont, Victor du Pont Jr., Alexis du Pont, Eugene E. du Pont.

Dreyer 33, Ira McKane 26, Dr. Goubeaud 27, E. Voorhies 33, H. Bergen 27, G. Kelly 42.

Five pairs: E. Voorhies 6, Kelly 4, Dreyer 4, Schorty 7, McKane 5.

Team shoot, 25 targets. Dede's team won.

Kracke	..	11	Dede	..	14
Schorty	..	23	Kelly	..	22
Voorhies	..	18	Montanus	..	18
Bergen	..	19	Goubeaud	..	15

IN NEW JERSEY.

ENGLEWOOD, N. J., July 6.—Inclosed please find scores of shoot of the Pleasure Gun Club, of Englewood, N. J., held on the Fourth of July. The club had a very pleasant day at the trap and entertained a number of visitors. Everything went off smoothly and everybody pronounced the day well spent.

The fourth event, which was a merchandise prize event, resulted in a tie for first honors; on the shoot-off Van Buskirk won handily.

Events:	1	2	3	4	5	6	7	8
Targets:	15	15	20	25	15	15	25	5
Richter	8	11	14	19	11	12	22	..

Hill	4	3
J Marsh	..	3

Shoot-off fourth event: Van Buskirk 19, Harlan 16.

C. J. WESTERVELT, Sec'y.

Montclair Gun Club.

Montclair, N. J., July 9.—But eight men faced the traps to-day. Messrs. Kendall and Moffett made the highest scores. Mr. Moffett broke 47 out of 50 in the contest for the Parker gun. Mr. Kendall broke over 80 per cent. This means something on the grounds of this club, as targets are thrown at all possible angles, and as swiftly as possible.

Events:	1	2	3	4</
---------	---	---	---	-----

WESTERN TRAP.

Homer—Ogden Tournament.

If managers of gun clubs would listen to Paul North as to the proper handling of one trap or one set of traps there would be a saving in conducting shoots; so here we find that a magatrap and a Leggett were both in motion, and that with only seventeen shooters present. At the Illinois State shoot three traps were kept going all three days, at a big expense to the management, when two would have been ample.

The weather was not the best; there was rain the first day and then dark clouds the second day.

The home shooters were well represented, and three shot all the events.

Fred Gilbert came on and made a fine showing, losing but 19 out of 450 shots. So Chas. Wiggins proved a stiff proposition by lining out all save 30. Jim Head was scoring a straight now and then.

Leslie Standish came in for due praise for the way he handled the cashier's office. Scores:

July 6, First Day.

In Other Places.

The Greenfield, Mich., Gun Club has been in existence for some two years, and yet the secretary states that the scores have never been published in the sporting press. That this may not continue to be true, I hand you scores made July 4 at 25 targets: Borr 15, Miller 19, Monnier 21, Cabot 11, Cranston 16, Houghton 15, Hantz 24, Bohling 13. Second event: Borr 19, Miller 23, Monnier 20, Cabot 15, Bobian 4, Besoncom 17, Houghton 17, Hantz 25, Smith 3, Hawthorn 23, Grace 12, Bohling 15.

A new gun club has been formed at Washington, Ind. There are few there with experience as mad pie smashers, yet they will improve.

The Le Mars, Ia., Gun Club members did not come out on the morning of the 5th with headaches, so they got together to the number of fourteen for their regular practice day.

The Mexia, Tex., Gun Club held a handicap shoot, July 4, and there were thirty shooters present, those who shot through being: Jackson, 20yds., 130, broke 119; Bennett 130, 118; Story, 18yds., 130, 112; Dr. Watson, 17yds., 130, 112. All others 16yds., and 130 targets: Kendrick 100, Caldwell 102, Dr. Jackson 96, McCorkle 94, Karner 90, Stevens 89. The club will hold a four days' tournament. July 26 will be the opening day.

It will interest Indiana shooters to learn that the old Bedford Club has taken on new life. The club, in order to help along the celebration of the Fourth, held a tournament.

At Grand Rapids, Wis., the gun club has some enthusiastic members, so there was a goodly number out on July 3 to practice.

The shooters at Florence, Wis., are very similar in feelings to those of all other, as 'tis the expectation of improvement that causes the try-again. On July 4 the scores were at 25 targets: Threman 18, Swanson 8, Hackings 21, Magsman 15, Johnson 12, Peterson 13, Evans 4, Guyharoway 6.

The Trenton, O., Gun Club held a nice shoot July 4. Several of the Hamilton Gun Club made a visit. Wind was high and weather not the best. The mingling with good shots will be a stimulus to the beginner at all times.

The shoot at the Ennis, Tex., Gun Club grounds on July 4 was a hot one. Dave Curran won the cups for both Texas championships from O. F. Dunkerly in the first event, the score being: Curran 88, Dunkerly 87. In the second Curran 93, Dunkerly 91. Curran has won the amateur championship now six times.

The Ennis, Tex., Gun Club will hold a tournament July 27 and 28. \$200 added money. Ed Fain will send out programmes and give all information desired.

On Aug. 3 there will be a tournament at New Berlin, O. For programmes address John L. Schlitz, secretary.

The Houston, Minn., Gun Club shot a match with Wicota Gun Club July 3 and won, 145 to 121. Then on July 4 another, and this time lost by three targets. The score was 107 to 104, in favor of Wicota.

The first tournament given by the Rossville, Ga., Gun Club, July 6, was a great success, as shooters from surrounding cities were present to help things along. The weather was bad. It rained part of the day. Of those who shot through, P. B. Plumber with 93 per cent. was high man, and then next came O'Connell, the well-known Chattanooga shot, with 84½ per cent. At the close of the regular programme there was a special event, with a handicap target allowance, for a handsome silver loving cup. In the end W. O. Burks, with a handicap of 5, came off with the cup after a tie and two tie shoot-offs. The Rossville club has not been in existence over a year, and yet there are some good shots among the members, some of whom will give the Mountaineers a run for their white alley when the Aug. 23 and 24 tournament is held by the latter club.

Kalamazoo, Mich., trap enthusiasts are getting ready for a big shoot to be held in August. Shooting is surely advancing in the celery town, as one good shoot has already been held, which bespeaks another. This shoot will no doubt be circled with that of Grand Rapids, which possibly may prove a mistake in judgment on the part of the managers.

The shoot at Sterling, Ill., was postponed for a week owing to very threatening weather.

There was an exciting shoot at Hillsboro, Ill., Club grounds, July 1. Emery Thompson and Longwell tied on a 50 target race, and also on second 25, and it was drawn out to the eighteenth round before decided.

Beaumont, Tex., Gun Club boasts of such fine grounds and altogether up-to-date appurtenances that the officers have made special requests for the lady friends of the shooters to attend, and many of those who have some knowledge of firearms will be induced to try smashing targets. A late hour has been set, so the sun's rays will not interfere.

The historical and beautiful grounds of the Springfield, Ill., Gun Club were open on July 4, and all lovers of target shooting were invited to be present. This is one of the grounds to which the Interstate Association has been directed as most suitable for the purpose of holding the G. A. H.

After the Grand Western Handicap shall have been held this week at Denver, there is a prospect that the Denver Trap Club will move their shooting paraphernalia to the Overland Park.

There will be more than one big shoot on in the West during this week. Menominee, Denver and St. Paul expect large gatherings of the clans.

The Superior Gun Club did not shoot on the Fourth, as on the 3d the whole club participated in a shoot given by the Duluth Club. Both clubs will unite, and all hope to get well up in the

target busting line by the time the shoot is held in Duluth on July 21 and 22.

The Owatana Gun Club, of Minneapolis, held a shoot July 1. The trophy shoot at 20 targets found the scores thus: Britt 17, Waddell 13, Saulpaugh 17, Nyquist 10, Rest 4, Overman 3, Stephan 14.

There will be a newly incorporated gun club at Seattle, Wash., with the title Swuomish Gun Club.

The shoots held by the combined cities near Jamesville, Wis., are growing more popular weekly. July 2 there were twenty present from Beloit, Fort Atkinson, Milton and from Chicago. Jamesville surely has taken on the "shooting boom" for the 1904 season.

The Menominee, Mich., trap shots held an informal practice shoot July 4, with a view to get into good practice for the big shoot that comes off this week.

John Avery, near Burlington, Ia., a one-time famous local shot with both the rifle and the shotgun, has broken into the game again, and on July 4 and 5 held a shoot at his farm, where all were made welcome.

Freeport, Ill., once so famous as a trapshooting center, that targets were bought by the carload, has had an awakening, and the reports that shooting is fairly regular there this season. There was shooting at the club grounds on July 4.

Without the usual Texas wind the Fort Worth Gun Club members held their shoot Saturday last with Dr. Frazier, a winner of high average with 60 out of 75. Then there were Childress and Tiller with only one less. The club has a large membership, and though there was not much spirit at the start, many names are being enrolled.

The trapshooting interests have been more advanced than any other one thing by the advent of the trolley car, and especially the interurban. Hundreds of clubs now have their grounds miles out in the country, and many accommodate more than one town on same grounds. It is a good thing to locate on some farm or where no one can possibly be annoyed.

The Peters Cartridge Company appreciate the efforts of the newly organized gun clubs and are not slow to offer assistance. One of the latest is that of a cup donated to the Fargo, N. D., Gun Club. C. L. Fargo says it is handsome, and suitable handicaps will be adjusted to become its possessor.

Gene Parker, of Minneapolis, Minn., not only won the trophies at the late gun club shoot, but he made some wonderful strides at the Winona Interstate shoot. While Mrs. Johnson beat her husband, she did not come up to Parker in the medal events.

The El Paso, Tex., Gun Club members were last week engaged in getting their eye on the targets from the handicap distances, and their scores were low. A welcome visitor was Lieut. Farnham, who was taking his first lesson in the art of wing shooting.

Mr. Clayton, of Kansas City, Mo., has won about all the trophies that are open for competition in the Missouri valley. His last effort brought him the Pigeon Wing trophy with the fine score of 47 out of 50 live birds, beating out A. C. Holmes, who scored 44. He also successfully defended the Elliott target trophy, getting 90 on the Elliott handicap. There will be a hot race when the next Pigeon Wing trophy is up, as Mr. Clayton will have for his opponent that very good Kansas shot, Ed O'Brien.

Capt. Autrey Green again won the medal put up by the Beaumont, Tex., Gun Club. This time with 44 out of 50. Tyrell, Jr., made 43, J. M. Fisher 42, J. K. Took 41. Much enthusiasm was stirred up over the contest.

Though late in the season, the Lamar, Mo., Gun Club has started out by electing officers, thus: E. L. Moore, President; C. A. Lockwood, Vice-President; O. T. McAdow, Secretary; A. M. McCrea, Captain.

When the gentlemen who follow the pleasant game of trapshooting meet in Duluth, July 20 and 21, they will find the Commercial Club thrown open to themselves and all their friends. Yes, there will be a good time at the head of the lakes.

There was a bluerock tournament held at Hoquiam, Wash., on July 2. The programme included a team shoot for the championship.

Whitmore and Schaberlee were the best shots contesting at the Pastime Gun Club grounds in Detroit, Mich., on last Sunday, as each broke 20 out of 25 bluerocks. In the merchandise shoot it was Tristram who won Class A, Schaberlee Class B, and Weise Class D.

The monthly shoot given by the Fort Worth Gun Club was a winner, so far as real merit was concerned. Each one received a prize, and drew by lots. Each was compelled to open the prize before the crowd. One drew a pair of corsets, and others, ladies' hose; then babies' shoes, liver pills. There was shooting and fun enough for the glorious Fourth.

The Knoxville, Tenn., Club has a shoot now and then. One of the amusements of the South is that of shooting matches on the Fourth, so a few hundred people turned out at this historic town to witness some target smashing. Frank Hall won a coat with 41 out of 50; Curtis a stick pin with 40; Thomas Eldridge won a box of cigars for the best score by an outsider.

Northern Illinois has had an awakening in the target shooting line. Last Saturday at Aurora J. Van Burton won the loving cup by defeating Guy Conde. There will be a match shoot held soon between a team of five men each from the towns of Batavia and De Kalb. There will be two matches, one in De Kalb and the other in Aurora.

Ohio Trap.

Cincinnati Gun Club.

The Cincinnati Gun Club held a special holiday shot on July 4. Nineteen shooters took part. J. Penn, a former secretary of the club, being high gun with 183 out of 200.

July 9 was a fair day for shooting, partially cloudy and with a fresh breeze, which did not, however, affect the flight of the targets to any extent. Twenty shooters entered the contest for the Parker prize gun, and some good scores were made. Medico was high gun in actual breaks with 91. Harold Money is spending a few days here as the guest of Supt. Gambell. He was at the grounds to-day and in the main event broke 92.

Ackley starts next week for his outing with rod and reel in the North. Gambell, Pfeiffer, Pohlar, Osterfeld and a few others are going to Camp Dennison next week to open their summer camp and get things in order for the season.

Parker prize gun shoot, 100 targets, handicap of added targets: Medico (12) 100, Harig (40) 100, Pohlar (35) 100, Lindsley (25) 100, Faran (18) 100, Maynard (18) 100, Roll (19) 100, Peters (20) 100, Davies (23) 100, Pfeiffer (40) 100, Jack (30) 100, Kramer (40) 100, Herman (30) 100, Hobart (40) 100, Smith (60) 100, Williams (18) 100, Norris (30) 100, Money 92, Gambell 83, Redwoss (25) 80.

Money and Gambell did not compete. At the Rohrer's Island Gun Club shoot, Dayton, O., July 7, Geo. C. Rohrer and C. F. Miller tied for the medal on 22. It required two shoot-offs to decide the winner, Rohrer breaking 15 out of 18 shot at to Miller's 14 out of 15. The club will hold an all-day shoot next Wednesday, with a barbecue feast for dinner. All Miami Valley shooters with their families are invited to be present.

At the Greenville, O., Gun Club shoot, July 4, the attendance was quite good and the day fittingly celebrated. The club will hold its regular shoots every Monday from now until the open season on quail begins. In the medal event to-day Kirby and Johns were high with 25 each. In the special events McCaughey was high gun with 34 out of 40. Baker second with 31.

The tournament of the Springfield, O., Gun Club held on July 4 was a big success, twenty-three shooters taking part. Henderson was high gun with 104 out of 128; Snyder second with 101, and Watkins third with 100.

The holiday shoot of the Riverside Gun Club, Columbus, O., on July 4, was well attended. There were three events at 10, two at 15 and two at 25. Darby did the best work, missing but 2 out of 75, going straight in a 10 and a 15 target event, and breaking 24 in each of the 25-target events.

Aquidneck Gun Club.

Newport, R. I.—The main event at Wednesday's shoot, July 6, was the semi-monthly race for the Powell cup, which brought forth some splendid scores on the part of the eight contestants present, more than half the totals showing more than 80 per cent. average. Bowler, making a poor start by dropping three in his first string, finished out with 46, for which he will have the privilege of toeing the 17yd. mark at the next shoot, two weeks hence. The scores:

Targets: The score				Targets:					
	10	15	10	15		10	15	10	15
Bowler	7	15	9	15	H Peckham, 17..	7	11	8	14
Alexander	9	13	10	13	Mason	7	11	8	12
Dring	9	12	8	14	Hamilton	4	12	7	14
Powell	8	12	9	13	Coggeshall	7	12	6	8

Recreation Rod and Gun Club.

MORGANTOWN, W. Va.—The Recreation Rod and Gun Club, of this city, held its fourteenth regular weekly shoot at Recreation Park, on Thursday, July 7, and while the shooting was above the average, the attendance was light, owing to the fact that our "independence special" occurred on Monday. The shooting was good, considering the fact that the day was showery and windy, at times blowing almost a gale. The scores:

First event, miss-and-out: Cobun 4, Jacobs 18, Price 18, Sivey 6, White 17, Dawson 2.

President's cup, handicap, sliding handicap:

Price	21	17	Dawson	19	14
Club prizes, classes A, B and C, 25 targets:			Cobun 15, Jacobs 23,		
Price 23, Sivey 19, White 20, Dawson 18,				19	11
Club team races:					

Club prizes, classes A, B and C, 25 targets: Cobun 15, Jacobs 23, Price 23, Sivey 19, White 20, Dawson 18.

Club team races:

Targets:	60	30	30	Targets:	60	30	30
Price's team	50	28	25	Jacob's team	47	26	27

President Bennett S. White broke the club record for this year on consecutive breaks by running out 31 without a miss.

Price's average for the day, shooting through a programme of 195 bluerocks, was 89.1 per cent.; Jacobs, 84.5 per cent.; White, 80.0 per cent.

ELMER F. JACOBS, Sec'y-Treas.

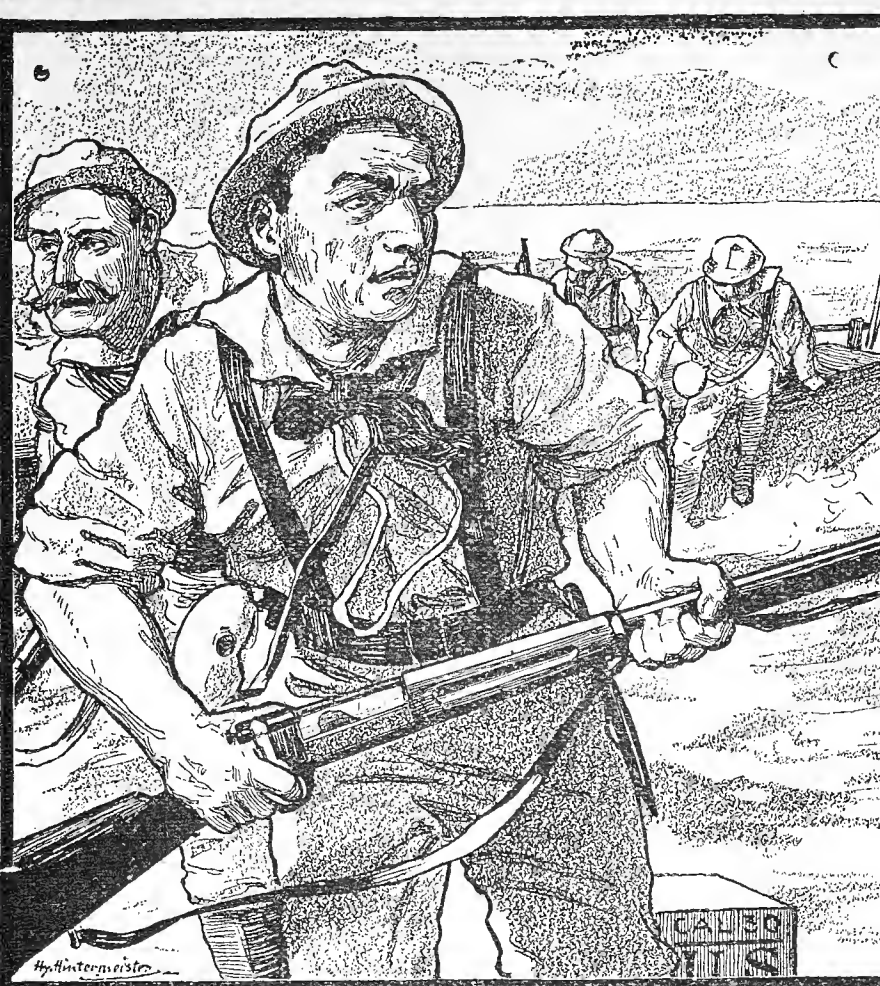

MORGANTOWN, W. VA., July 8.—The secretary-treasurer of our club has handed me the scores of our regular weekly shoot on June 30 to forward to you. I wish to add a few words by way of explanation. The value of the president's cup is \$25, and is shot for weekly under handicap conditions. The first time a contestant shoots for the cup he shoots at 20 targets, and at every subsequent shoot he shoots at from 17 to 29 targets, according to his percentage in this event the previous week, the percentage being always figured on a basis of 20. The contestant winning the greatest number of times during the season of thirty shoots wins the cup.

In event No. 3 the prize up was a League of American Sportsmen gold badge. This badge was shot for under a sliding handicap. Each contestant got as many extra targets to shoot at as he missed in the original event of 20 targets, with one allowed as broke for every three missed.

All the members of the club are classified according to their percentage for the season of 1903, into classes A, B and C. To each class is allotted a prize. To Class A, a Henshall model Bristol rod; to Class B, a Stevens target pistol; to Class C, a sole leather shell case. These prizes go to the contestants who, in the club prize event of 25 targets, make the greatest gain in percentage over their last year's percentage. The club also has up a championship medal for 1904. This medal is won each week by the man making the highest percentage, who shoots through the programme for that day. The man winning it the greatest number of times during the season to be final possessor. Scores:

First event, 10 targets, practice: Dawson 10, Sivey 8, Cobun 9, Jacobs 8, Price 9, Deussenberry 7, Geo. Miller 6, White 7.

Second event, President's cup, handicap, President White, donor; Deussenberry was winner for the week: Dawson

U.S. CARTRIDGES

The National Gun Club.

FRENCH LICK SPRINGS, Ind.—It was indeed a jolly and enthusiastic lot of sportsmen and their wives and friends who left Indianapolis, the scene of the last and greatest Grand American Handicap at Targets, for French Lick Springs on Saturday, June 25, to take part in the tournament of the National Gun Club, June 28 to July 1, at that famous resort.

President John M. Lilly had arranged for a special car to leave Indianapolis at 4:45 P. M., and the following are those to take advantage of this comfortable manner of making the journey: John M. Lilly, president of the National Gun Club, his wife and daughter, Miss Conway Lilly; Mr. and Mrs. H. McHolloway, J. A. R. Elliott, Fred Gilbert, C. F. Reust, of Oklahoma; J. L. Head, Jack Fanning, Tom A. Marshall and daughter, Miss Maud; Mrs. E. H. Tripp, Col. J. T. Anthony, Chauncey M. Powers, Frank C. Riehl, A. C. Barrell, Geo. T. Little and Guy Burnside.

Saturday at Indianapolis had been a very warm and uncomfortable day, and bid fair to be anything but a pleasant one upon which to travel, but as the train left the depot, a terrific storm broke and the downfall of rain served to cool the atmosphere as well as to allay the dust of travel. The play of lightning, accompanied by the terrific peals of thunder, gave to those students of nature, aboard the train an opportunity to enjoy old dame nature in her worst mood. However, by the time the train arrived at French Lick, all signs of the storm had disappeared, and, upon entering that magnificent palace, the French Lick Hotel, ablaze with electricity and swarming with a gay crowd of guests assembled from the four quarters of the globe, and where a warm supper awaited the hungry travelers, not a one of the party but was glad he or she had made the trip, with an opportunity for the shooters to rest over a quiet Sunday from the trying experiences of the big Grand American Handicap at Indianapolis.

Sunday was a most beautiful day, and was enjoyed by the members of the party as best suited their various tastes. Some walked about the beautiful grounds, some rode horseback, some of the Indian tribe took the electric car over to West Baden to have a look at the grounds where the Indians are to have their annual tournament in August, and others spent the day in quiet rest in and about the hotel.

The evening trains augmented the crowd by bringing in Will K. Park, Ernest H. Tripp and W. R. Crosby.

On Monday, the 27th, a number of 25-bird races were shot by those already at the hotel, the scores of which follow. This day also brought in Capt. John W. Cooper and wife and daughter, Marguerite, of Indianapolis; Dr. O. F. Britton and wife, of the same city, and C. S. Bahney, of Carthage, Mo.

June 28, First Day.

There is no more beautiful or comfortable spot on the globe to hold a tournament than French Lick Springs, and just why this attraction, with \$500 in cash and a beautiful championship cup donated by that prince of good fellows, Tom Taggart, and the money to go only to amateurs, did not draw a larger crowd of the latter is beyond the comprehension of the writer. It really seems that the amateurs of the country had not studied the programme of this tournament, or if they had they did not fully realize and appreciate the treat in store for them and provided by Messrs. Lilly and Taggart.

The shooting grounds are about five minutes' walk from the hotel, and while the background was not of the best, yet every comfort in the way of seats and shade had been provided by the management, and what a relief at noon time to suspend the shooting and repair to the hotel for an excellent dinner and an hour's chat upon its wide verandas, instead of having, as is usual at tournaments, a hand-out of some kind in a 7 by 9 tent.

The handicapping committee having met just before the opening of the programme and arranged the different handicaps of the contestants, the programme was soon carried out in the most pleasant manner, with Mr. Chauncey M. Powers, the world renowned amateur, leading the procession with 191 breaks out of 200 shot at from the 20yd. mark. The scores:

Events:	1	2	3	4	5	6	7	8	9	10	Broke.
Dr. J. Knowlton, 16.....	15	17	18	19	19	19	15	19	16	17	174.

Geo. Ballard, 16.....	19	19	18	19	20	17	16	17	18	17	186

June 29, Second Day.

A storm had raged during the night previous to this day, but President Lilly was again favored with National Gun Club weather and the day was a beautiful one, the programme being carried out without a hitch of any kind. The crowd had begun to get acquainted with the guests of the hotel, and the guests of the hotel had just begun to realize that they were watching the world's greatest shotgun artists, and further, to realize that this crowd of artists could enliven a resort just a little better and in as genteel a manner as could be imagined.

After the close of the programme and the splendid supper, the wide auditorium of the hotel, ablaze with electric lights and adorned by the beautiful faces and gowns of the ladies, was given over to the guests for dancing to the music of the splendid orchestra. But not until President Lilly had made a brief address to the guests, setting forth some of the points of interest regarding the contest, and Miss Maud Marshall had entertained

with a song in her own inimitable and sweet manner to the delight of all present.

The scores herewith appended show that Mr. C. M. Powers again led from the 20yd. mark with 193 breaks out of 200 shot at, with Crosby and Fanning close behind with 191 and 190 respectively. It was at the close of this day that interest began to center in the contest for the National Gun Club's championship of 100 targets, all from 16yds. The five 20-bird races as follows constituted this race: Event No. 10 of the first day and events 9 and 10 of the second and third days. At the close of this the second day it was seen that Frank C. Riehl was in the lead with 60 straight breaks, Crosby having made 20 straight in the first day and dropping only one in the 40 of this day, was but one behind, and Chan. Powers, with the same score to his credit in the same place. Jack Fanning, who had dropped two in his first race on Tuesday, was coming along easy with 40 straight on Wednesday, but with the lead Riehl, Powers and Crosby had, it did not appear that Chief Bull Seal even had a look in, while Fred Gilbert, with 5 to the bad, was considered out of the race. The scores for this day are:

Events:	1	2	3	4	5	6	7	8	9	10	Broke.
L. Ballard, 16.....	16	16	17	19	19	19	17	18	18	18	177
J. K. Knowlton, 16.....	18	18	18	18	19	16	16	19	20	17	179
J. W. Cooper, 16.....	19	18	16	19	18	19	19	17	19	18	182
Col Anthony, 16.....	18	18	19	18	18	19	19	17	15	18	179

Ed Speece, 16.....	18	19	18	16	17	17	15	17	14	18	169

June 30, Third Day.

During the night another storm had raged, but the morning broke bright and pleasant, and the shooting was resumed with slight changes by the handicapping committee, placing Mr. Powers back on the 21yd. mark, with Crosby; Gilbert and Tom Marshall back to 19; Guy Burnside, who had been shooting strong, back to 18, and Jack Fanning, who had been showing remarkable form, from 19 back to 20, alongside Jim Elliott.

It remained for Ernest H. Tripp, who had been called away for the second day, to lead the bunch on this the third day, with 189 breaks out of 200. Mr. Tripp shot from 17yds., which goes to show what this great amateur can do when he lays aside his fun-making and tries to shoot. Crosby was second, with Chan. Powers third, with 185 and Jack Fanning coming strong with 184. The scores:

Events:	1	2	3	4	5	6	7	8	9	10	Broke.
L. Ballard, 18.....	19	19	19	18	19	19	17	18	18	18	184
J. W. Cooper, 16.....	19	19	20	17	19	19	15	18	18	18	182

It was on this day that the championship of the National Gun Club was decided, and such a finish has perhaps never been witnessed in a similar contest in this or any other country. As Frank Riehl, who had 60 straight to his credit at the close of the third 20, blew out his fourth 20 in splendid time and manner, every one conceded him the cup with only 20 more to shoot at, as Crosby and Powers had dropped each one in their fourth 20, leaving them 2 to the bad, and Fanning had also dropped one, leaving him three behind. But it is right here that the uncertainty of the shotgun game was demonstrated. Every one wanted Frank Riehl to break his last 20 straight, as he had made such a magnificent run of 80, and Frank was surely anxious to please his friends, as well as to well represent his company. In fact, it seems that over-anxiety for the time being put Frank apparently out of the running, and seemed to lose him a splendid championship, which he had in his grasp, for he slipped 3 in his last 20, going out with the very creditable score of 97 out of 100, which ought to win anywhere, but which did not seem so good after breaking his first 80. With two such world-beaters as Chan Powers and Billy Crosby, now each 1 to the good and only 20 to shoot at, it appeared that one of them would certainly go out with 98 and win. Again was the uncertainty of the game demonstrated when Powers lost 2 early in the race, going out with 96. Crosby was shooting the race of his life, and with but 4 yet to go and the 16 blown into dust, Frank Riehl walked out toward the score to congratulate the great shot upon his splendid finish. But the finish was not yet, as Billy's seventeenth target made an elusive duck, and the score was a tie between Crosby and Riehl, with 97. Right here the spectators and contestants were treated to another surprise, for

when the talk begun to go about that the tie would be shot off at 50 targets, one Jack Fanning sent a boy to the hotel for more shells. No one had been watching the little Bull Seal, but he had evidently been watching himself, for with two misses in the first 20, he had lost but one in his last 80 and was also a tie. Right here it was conceded by all present that Fanning was in the tie, and the way he had been shooting, he was in it up to his eyes, too, all of which will be shown by the result. Just as these three artists were called to the score, another storm broke, and the wind began to play havoc with the flight of the targets. In the first 25 Frank Riehl lost his 22d, while Fanning and Crosby went 25 straight. But in the second 25 Crosby lost his 1st, or 26th of the race; Fanning his 7th or 32d of the race, while "Old Chief Piasa," Frank Riehl, blew off the 25, making a finish for the three of 49 each. The excitement and interest was intense, and every one felt glad about Frank Riehl, for he was still in the fight and growing stronger every shot. Crosby, that greatest of all match and tie shooters, certainly had the hardest proposition of his life before him to shoot out Riehl and Fanning the way they were both shooting, and the experts present almost to a man conceded to Fanning the victory, account of his perfect time. As the storm continued to rage, Mr. Lilly announced that the tie would be shot off at 25 targets, and at it these three giants of the shooting world went again. Riehl and Fanning seemed determined to make this a win, as each scored 25 straight, while Crosby, drawing for his third and 20th targets two low targets, which in the very poor light it was almost impossible to see either of them, scored only 23, putting him out of the tie. Again the spectators cheered the game fight being put up by Riehl and Fanning, as they were called to the score to shoot another string of 25, with heavy clouds fleeting across the sky and lowering every minute. It was indeed a trying race for both the contestants, and Frank Riehl won out by 2 birds, losing only his 14th in the last string of 25, making him a grand total of 98 out of the 100 in the shoot-off after a 97 in the original. Truly a score he may point to with pride, so long as he lives. Fanning, whose shooting was phenomenal, got the hardest kind of a draw, losing his 10th, 15th and 19th in the last string, finishing with 95 out of the 100 in the shoot-off. Riehl broke 67 straight in the ties.

In the evening, before a splendid audience, President Lilly, in a neat speech, setting forth the aims and purposes of the National Gun Club, the incentives in a sportsman's mind which causes him to participate in this sport, and in which he paid a great tribute to the pastime and its followers, called upon Captain Marshall, of the All-American team for a little story of the team's trip abroad and its victories, to which the Captain responded in his own way, winning much applause for himself and the victorious Americans. President Lilly then presented Mr. Riehl the beautiful trophy emblematic of the championship of the National Gun Club, and which was the gift of the French Lick Hotel Company. Frank had gained favor with the assembled company as a shooter, but it was in his reply that he gained the admiration and respect of all present. The writer has never listened to a more modest and intelligent reply made by a victorious shooter to a presentation speech. Would that the world was full of Frank Riehls. The scores in the shoot-off follow:

Cup race shoot-off:

Riehl.....	49	25	24	—98
Crosby.....	49	23	—92	
Fanning.....	49	25	22	—96

July 1, Fourth Day.

Again we were treated to a splendid day, and interest centered in the 100-bird handicap, to which the Hotel Company had graciously added \$50 in cash. Jack Fanning won first money on a score of 96; Chan Powers second with 95, and Fred Gilbert third with 94, while W. R. Crosby and your humble servant finished just outside the money with 93. This race comprised the last 100 birds, or the last five races on the programme. The scores:

Brown.....	14	11	11	11	12	12	16	16	16	16	64

The French Lick Hotel Company generously added \$50 to be divided among the five high guns, which was won as follows: C. M. Powers, first with 757 out of 800 shot at; Crosby, second with 750; Fanning third with 748; Gilbert fourth with 739, and Guy Burnside fifth with 730.

Thus ended a most enjoyable event, and on Friday night and Saturday morning the shooting crowd wended their several ways to the great regret of the hotel guests, as they had certainly furnished amusement and entertainment for all, and certainly to their own regret, for the French Lick Hotel Company, Tom Taggart and John M. Lilly certainly know what to do for their friends.

J. L. HEAD.

Cincinnati Rifle Association.

THE following scores were made in regular competition by members of the Cincinnati Rifle Association at Four-Mile House, Reading Road, July 3. Conditions,

Sherbrooke Gun Club.

SHERBROOKE, Quebec, is well named, when it is called Canada's "Progressive City," and its gun club is one of its many live institutions. The members of this club are mostly active business gentlemen who take to this kind of sport, that of trap-shooting, as a pleasant and healthful recreation.

This club's shooting park is by trolley line within easy access of the business part of the city. They have a comfortable club house with a magatrap and expert traps, etc. The background, while not perfect, is better than the average found on similar grounds, the only serious objection is that a couple of fine elms are in range of the left quartering targets. It would be a sacrifice to cut these noble trees down, though the pepping that they must receive during practice days must make life a burden for them.

Dominion Day, July 1, is the date for this club's annual tournament, and the one held there last Friday, though not large in attendance, was a very enjoyable one, as the day was perfect and the general arrangements were all that could be desired.

The trade was represented by J. H. Cameron, E. G. White and N. P. Leach. The club's secretary, Mr. C. H. Foss, with the assistance of Mr. Cameron, attended to the duties of the cashier's office. Mr. Bray, Jr., was official scorer, and Mr. Leach was umpire of the team shoot between the Montreal and Sherbrooke Clubs.

All present had a royal good time, that is, with one single exception, that of the writer, who was a little off. We had a new gun and a several years' accumulation of old shells of all kinds of loads which were not conducive to making good scores. These facts were seemingly taken advantage of by our younger competitors, who proceeded to, figuratively speaking, smite us on the hip, jawbone, stomach, in fact, they walked all over us, to our discomfort. They took our money, that is, the cashier did, as we paid for our targets and received no discount for the pick-ups; and when we borrowed some good loads and ran up a respectable score, the young pencil-pusher of a scorer, by mistake, marked down our duck eggs in the place of our breaks, which made our score look mighty small, I can tell you. Then, again, that staid, respectable old gentleman of a Montreal grocer, who we should be able to beat with any kind of a load, must get frisky and start off at a record-breaking pace which left us so far behind that we weren't within "hollering distance."

When we compare our scores with those made by the other shooters, we feel that they must have a prejudice against us, and such being the case, we feel perfectly justified in withdrawing our name from the list and remain by ourselves in congenial company—Ta-ta.

The ninth event was the team event, which we give first place. Five-men team, 20 targets each, \$10 entrance: Montreal team—McDuff 18, Redman 15, Dumont 16, Landriault 16, N. Candlish 16; total, 85. Sherbrooke team—Thompson 18, Craig 19, Bray 19, Goodhue 16, Foss 13; total, 85.

The following events do not include those of the merchandise contests which were for twenty-one prizes, some of which were quite valuable:

Events:	1	2	3	4	5	6	7	8	9	10	11	12	Broke.	Av.

STANSTEAD.

Ashland Gun Club.

LEXINGTON, Ky., July 4.—That the Kentucky Trapshooters' League made no mistake when they decided to accept the invitation of the Ashland Gun Club to hold the annual shoot for the Blue Grass championship at targets was demonstrated yesterday, when the local club handled the shoot in a most satisfactory manner. The park had been put in almost perfect order, the traps worked splendidly, the dinner served free to the shooters and their friends was characteristic of Kentucky hospitality. For the first time in the history of target tournaments in Kentucky, the shooting began promptly on schedule time and the entire programme of 250 targets was finished before dark.

There were twelve events on the programme, eight at 15 and four at 20 targets, \$1.50 and \$2 entrance, and a thirteenth at 50 targets for the Blue Grass championship and a sterling silver loving cup to become the property of the winner. Anyone living in the counties in the Blue Grass Circuit and not manufacturers' agents were eligible to competition in the championship event; entrance, \$2.50.

The smoothness with which every event was shot was due largely to the efficient work of manager Robert R. Skinner, who has few equals and no superior in this line. The squads were handled with an ease unusual to a big tournament by the management, the traps being under the direct supervision of Mr. Jeff Harp, the office being attended to by Mr. John Gilbert, who officiated as cashier. Mr. G. T. Little tabulating the scores. Messrs. George Offutt and A. D. Skinner were referee and scorer at traps No. 1, while Messrs. K. G. Pullian and George K. Graves filled these positions at the second section, or traps No. 2.

Messrs. Howard Curry and Frank Van Deren, who are respectively president and vice-president of the club, had charge of the dinner and refreshments, and they fully sustained their reputation as exponents of genuine Kentucky hospitality. Mr. Wilson P. Strader mixed with the crowd and saw to it that every guest of the club had no dull moments.

In the championship event there were twenty-two entries. Messrs. J. H. Kemper and John Williams, of Mt. Sterling, and Mr. Woolfolk Henderson, of Lexington, tied with a score of 45.

In the shoot-off at 25 targets, Mr. Kemper won with a score of 23, each of his opponents going out with 22. Mr. Kemper thus for the second time won the championship of the Blue Grass, he winning it in 1903 at Mt. Sterling, Ky., with a score of 48.

The beautiful cup, emblematic of the much-coveted honor, was given by the Ashland Gun Club, in whose behalf the secretary, Mr. George K. Graves, presented it with a neat little speech to Mr. Kemper, who gracefully received it and responded by tossing over not a few nice bouquets to the hospitable reception and splendid management of the Ashland Gun Club, every visiting shooter applauding his remarks.

The high professional average was won by Mr. Ralph Trimble, scoring 191 out of 200. High amateur average was won by Mr. T. H. Clay, Jr., of Austerlitz, Ky., with a score of 189 out of 200, Mr. Woolfolk Henderson second.

More than 8,000 targets were trapped during the day, which in itself speaks volumes for the capacity of the local club, its efficient management, as well as for the growing popularity of target shooting with Kentuckians.

Brunswick Gun Club.

BRUNSWICK, Me.—The Fourth of July tournament of the Brunswick Gun Club has gone into history as one of the most enjoyable ever held in Maine. It was run off over a set of five expert traps, known traps and unknown angles. Thirty-five names made the entry list, and twenty-one shot the entire programme.

Much credit is due Mr. C. Whitmore, the president, for the pleasant manner in which the shoot was conducted. He had looked after the smallest details, and had everything, as the saying goes, "all smooth." Mr. E. B. Thompson helped the secretary in the office throughout the day, and as the trap boys and others came up for their pay at the close of the programme, Tommie was heard to say, "What do I get? It seems I ought to get as much as a trap boy." And he got it, but not in cash. Don't ask him about it.

The trade was represented by Mr. E. B. Thompson and Mr. T. Haze Keller.

All were pleased to see the veteran of Wellington win high average. When Mr. Dickey holds another tournament you will see some Brunswick boys in attendance.

The high wind knocked all high scores. Up would go a shooter on one event and break straight, on the next drop five or six. But all tried for a good time, regardless of scores. The Brunswick club wishes especially to thank Mr. Dickey and Mr. Allison for attending, and trust that they can come again at some future time.

The eleventh event was shot one man up, less than 80 per cent. at 16yds. rise, 80 to 87 at 19yds. rise, over 87 per cent., 22yds. Percentage taken from the preceding events. Dickey was the only one to grace the 22yd. mark, and in the high wind cuffed out 17. Very few had to go back to 19yds, even the primer class predominating at 16yds., and Johnnie Bell was in it.

The purse in this event was \$10.50. Scott, of Auburn, Me., got first, with 23, which gave him \$4; Darton, of Portland, and Bartlett, of Brookline, Mass., scored 22 each, and got \$2.40 each. Bell, of Somerville, Mass., came third with 21 and got \$1.60.

O. R. Dickey got \$7 for first high average for entire programme. Hunnewell, of Auburn, second high, with \$5, and third high average was divided by Billy Darton, of Portland, and Harry Snow, of Auburn, \$1.50 each.

On the Whitmore special, to members of Brunswick Club only, Dunning got first money, \$5; Foster came second and got \$3; Wheeler third and got \$2.

It was the aim of the Brunswick boys to give everybody a good time, and it is hoped they did.

time, and it is hoped they did.												Shot	Broke.	Av.

THE "DEVIL-WAGON."

WITHOUT a doubt the automobile, as a means of transportation, is a permanency, for it has a special fitness in the transportation of freight or passengers in the traffic of the great cities.

The horse, in city traffic, suffers seriously in comparison with it. It is swifter, more powerful and economical than horses are, and, from a sanitary point of view, it has the further advantage of being incomparably more desirable.

The use of automobiles, for both business and pleasure, is multiplying with astonishing rapidity in the cities. The demand is constantly increasing. The world's manufacturing resources in this relation are taxed to their utmost limit of production. In particular, France and Germany, as manufacturers and exporters of automobiles, find special favor in the eye of American purchasers, and are enriched accordingly by many thousands of American dollars. The domestic manufacturers vie with the foreign in the competition to secure the profitable American patronage.

When properly used, the automobile has all the essentials of a public benefaction. It has no inherent malevolent properties which are harmful to society. But, as commonly used in the city streets by reckless drivers, it is largely a public nuisance, and a public menace.

The average chauffeur runs his machine with an utter disregard of the rights and safety of pedestrians, and with but little regard for vehicles drawn by horses. And yet oftentimes the chauffeur is blameless, inasmuch as, if he is a servant, he must obey the commands of his employer.

The common appellation of "devil-wagon," as applied to the automobile, has a peculiar appropriateness. A demon and his wagon turned loose among a people would not display more heartless indifference to their peace of mind or safety of person than does the average chauffeur. Any day, in New York, one can witness the driving of heavy automobiles at high speed, and the consequent scattering of men, women, and children at the cross walks, with a most contemptuous disregard of their comfort or safety, not to say rights.

The automobilist acts as if he had a proprietary right to the streets, and as if all others were on them by his tolerance. He habitually and contemptuously violates the municipal ordinance regulating the speed of vehicles. Of the many violators of the speed regulations, but few are arrested.

When arrested, the average automobile owner is imperturbably unconcerned as to what the judge thinks of the matter, calmly denies having violated the speed laws in the slightest degree, and by the hocus-pocus of delays and pettifogging, either succeeds in discrediting the testimony of the law officers, or in having the case dismissed.

The automobile is the toy of the wealthy. In the eye of the law there seems to be a vast difference between the fast driving of a horse by an ordinary citizen and the fast driving of an automobile by a millionaire. If it so happens that the offending automobilist is fined for violating the speed laws, he views the matter merely as an unpleasant incident of his ride. The fine, at the most, does not disturb him in the least. It imposes no punishment. He presents the same contumacious deportment regardless of the fine. He runs his machine to suit his own pleasure.

The speed ordinances were designed mainly for the regulation of vehicles drawn by horses. The punishments which they imposed were quite sufficient as deterrents on the people at large. The automobilists are a wealthy class to whom those fines and penalties are nothing. They are representative of wealth, power, and "pull," therefore they seem to have certain immunities not accorded to the humble law breaker. The hostility manifested in many sections of New York toward automobilists by the throwing of missiles, is a logical outcome of the law's inadequacy.

On this point, Judge R. C. Cornell, of New York, is quoted in the Evening Telegram as follows: "In saying in court the other day that a man who shot at a reckless chauffeur would be perfectly justified, I do not consider I was making an intemperate statement."

And on the inefficiency of the law he is quoted as saying:

The present law is absolutely inadequate to cope with the evil.

Fines are of no avail, because the majority of the automobilists are rich men. Of late the law has been taken out of the hands of the magistrates, so that now all we can do is to hold violators of the speed limit for the Court of General Sessions.

I think the only remedy is to give the owners of machines a taste of punishment. The poor chauffeurs too often are made scapegoats for their masters. If the owners were sentenced to a few nights on a hard cot in a cell, with bread and water, I believe the evil would soon be remedied.

The worst offenders, I think, are the nouveaux riches—persons who have suddenly become wealthy. They have never owned fast horses, have no conception of speed, and are incapable of handling a fast automobile. It is these people, whose heads have been turned, that override the public rights.

It is a strange situation, indeed, where the newly rich or the old rich have an immunity from punishment not vouchsafed to the new poor nor the old poor.

TO STUDY THE GOLDEN TROUT.

ONE of the most interesting of the American trout, and perhaps the most beautiful of them all, is the golden trout of Mount Whitney. The species, so far as known, is native only to a few mountain streams high up on the Sierras, and from some of these it has been transferred to other streams running into the Kern Valley.

For a number of years we have heard of an increasing scarcity of this beautiful fish, and reports have reached the Bureau of Fisheries that the golden trout is in danger of extermination. The matter has again been brought up recently, and Mr. Stewart Edward White, the author, has called attention to this danger. Still more lately the President has taken up the subject, and addressed a letter to the Commissioner of Fish and Fisheries, asking that inquiry be made to learn what should be done for the preservation of this species.

In compliance with the President's request, Fish Commissioner Bowers is sending out a party to the Mt. Whitney region to learn as much as possible about the golden trout. Dr. B. W. Everman will have charge of the party, and will be accompanied by a number of other scientific men who are interested in some aspects of the trout's life. It is believed that if a few specimens of this fish can be transferred to a Government hatchery and there artificially propagated, the danger to the species will cease to exist.

A NEW JERSEY GAME PRESERVE.

AFTER reviewing the unsatisfactory results of stocking water with fishes brought from the Great Lakes, the New Jersey commissioners express a conviction that instead of expending more funds in this direction, they might more profitably undertake the establishment of a State game preserve where native and imported species might have a secure refuge, and whence the covers of the State at large might be stocked.

This proposition, whether or not put into effect at the expense of any other work of the commission, is most sensible. The State game preserve, if only it be as well taken care of as are private preserves, will in large measure solve the problem of a perpetuated game supply.

SNAP SHOTS.

DR. JOS. KALBFUS, secretary of the Pennsylvania Board of Game Commissioners, has created something of a sensation by charging that agents of the Carnegie Institute, under cover of collecting birds for the museum of that institution, were conducting an extensive traffic in song bird skins, of which there were said to be in the museum 40,000 of those of Pennsylvania birds and 20,000 of those of birds from other States. The existence of the skins and the bird traffic itself, so far as the Carnegie Institute is concerned, was denied by Dr. W. J. Holland of the museum. The charge is now under investigation, and pending the result of the inquiry, comment may be withheld.

There is a broad tendency to guard and restrict very rigorously the killing of birds "for scientific purposes." The conditions are much harder than they were for the ambitious young scientist. In New York, for instance, the last Legislature enacted that applicants for license to collect birds for scientific purposes should qualify in a bond of \$200 for faithful observance of the law. This is only one manifestation of the growth of the idea of bird protection, which is one of the conspicuous popular move-

ments of the day. The sentiment has reached Mexico. Consul W. W. Canada writes from Vera Cruz that an agitation has been on foot looking to the passage of a law to prevent the wanton destruction of birds throughout this country; a proposed law has already been presented to the Government by the Association for the Protection of Birds, and it is confidently expected that it will meet the approval of the Executive. This law is intended to prevent the killing of certain classes of birds useful to the agriculturist. Other kinds, such as, for instance, game birds, may be killed only at stated periods of the year. All birds of prey, and others destructive to the interests of the farmer, may be killed at any time and by anybody. Such a law, if rigidly enforced, adds Consul Canada, cannot fail to be of great benefit to the people of the United States, as, for instance, in the case of migratory birds that winter in Mexico, or even further south, and that return to the north in the proper season if not killed off in the meantime.

It is reported that San Francisco is to have a beautiful aquarium—perhaps the finest in the world. The news comes from a San Francisco dispatch, which states that Mr. Lloyd Tevis purposes to build for the public use in San Francisco, as a memorial of his father, an aquarium which shall cost between \$3,000,000 and \$4,000,000. It is to be built in the Golden Gate Park, to whose attractions it will very greatly add.

WE shall leave it to Mr. Kelly and Rifleman to determine for themselves the burning question of whether, in writing of Daniel Boone and the squirrels he did or did not bark, they should use their own names, pen-names, or no names. In a general way, however, it may be said that in writing for FOREST AND STREAM one may do so over his own name or over a pseudonym with perfect propriety; and he is not to be criticised if he prefers anonymity. No one thinks the less of a writer, or gives less consideration to what he writes, because his signature is a pseudonym. In support of this we might cite a hundred pen-names, past and present, which have become as household words in the homes to which this journal finds its way.

OLD JOHN ESQUEMELING, whose racy history of the "Buccaneers" was as calculated to make pirate as Walton's "Angler" is to make fishermen, thought it incumbent upon him in his preface to warn his readers, lest they should be enticed by his chapters into taking up the profession of piracy, that it was dangerous business, and that most of those who were engaged in it found themselves of a sudden precipitated into another world. We recur from time to time to the perils of angling, not to deter from participation in this most delightful of pastimes, but that the sagacious reader of such examples may be warned by the fate of others to avoid the hazards, mishaps, and casualties which have been their undoing. For as a rule the perils are not inherent in the art of angling, but are attendant upon it only as a result of the frailty of human nature. Of this class, for instance, were the cases of the two salt-water fishermen cited last week who stood up in their boats to play a fish, one of them being drowned, and the other with difficulty rescued and resuscitated. Fishing from a small boat is perfectly safe, as the experience of millions testifies, provided only that ordinary prudence be exercised, and that the fisherman does not do some "fool thing."

A distressing case of fishing fatality is reported from Tortugas, Fla., and the pity of it is that it was all so avoidable if only the ordinary rules of conduct in a small boat at sea had been observed. The captain of a collier at the United States coaling station at Tortugas, his wife and daughter and two marines were in a dinghy off the reef fishing. In a lull in the sport, the captain, "a very jolly man" and "a very large man," reached over and playfully tickled his wife, "a very large woman." The wife jumped, the boat went over, and wife, husband and daughter were drowned. What makes the melancholy incident the more worthy of note is that the captain, "a man over six feet tall, weighing over 200 pounds, and a magnificent specimen of the American sailor," could not swim.

THE SPORTSMAN TOURIST

A Summer in Newfoundland.—V.

(Continued from page 48)

THE caribou is the hardest and most widely distributed of the deer family throughout northern North America. Extending from the Atlantic to the Pacific, his range is as wide as the continent itself, and stretches from eastern Newfoundland westward to the extremity of the Alaskan Peninsula. Bounded on the south by the United States, and on the north by the ice-bound Arctic Sea, his home is the grandest and wildest wilderness in the world. Whether on the great treeless desert of barren ground west of Hudson Bay, or among the dense forests of Quebec, or high up in the mountainous plateaus of British Columbia, or on the low bogs and marshes of Newfoundland, he is always a restless roving wanderer, always changing his home. Few of us have ever witnessed "la foule," the great fall migration of barren ground caribou, when tens of thousands of the animals travel from the vast tundras of Arctic America southward across the barren lands to the protection of the forests. The other well defined group, comprising the woodland caribou, has been divided by scientists into a number of species closely correlating with their geographical distribution. The theory that an infinite number of variations in nature should be followed by an infinite number of names is proving very useful in this case, for we now have at least five separate species with a possibility of a few more. The Newfoundland variety, *Rangifer terra-nova* Bangs, differs but slightly from that found in eastern Canada known as *R. caribou* Gmelin. The former is unquestionably a lighter colored animal, and is usually accredited with larger size, both in body and antlers; but specimens of *R. caribou* have been recorded fully as heavy as any from Newfoundland, while very fine sets of antlers have been secured from New Brunswick and Quebec. However, the antlers of *R. terra-nova* average much larger and heavier than those of *R. caribou*, and to-day the proportion of really good heads to inferior ones is very small in New Brunswick. Whether this greater massiveness and wider spread of the Newfoundland antlers are due to the fact that the colony is only partially wooded and contains many thousand square miles devoid of forest growth, or whether the better pasturage and warmer winters in the island are responsible for it, are merely questions for speculation. But it is a fact, none the less, that in Newfoundland the heads average superior to the thin, narrow-spread antlers of eastern Canada.

To be able to hunt any animal successfully, is merely to thoroughly understand its habits and mode of living. We know that all antlered game will act similarly under certain conditions, for there is no deer in America that will not seek safety in flight when the wind brings to his nostrils the scent of a human being. But we also know that each species has its own individual characteristics, and its own well marked peculiarities. Each has its preferences for particular localities, either wooded, barren or mountainous; each prefers certain kinds of grass, browse or moss, and each chooses different times for resting, traveling, sleeping or feeding; while all individuals conform pretty generally to the habits of the species. The man who has studied and knows well the habits of one particular moose or caribou, has a pretty general knowledge of all the moose or caribou in that particular locality, and such a man should prove the successful hunter. Of course, all animals have their own separate peculiarities or individualities, and especially is this noticeable when under domestication or in captivity; but in the woods, nature's laws are strict, and centuries of inherited habit have developed instincts which are strong and binding, and which must be obeyed in a successful struggle for existence. The caribou is perhaps the most individual member of the deer family in North America, and the least understood. He has none of the suspicious shyness of the white-tail; no sneaking quietly along back trails, or skulking under windfalls; no peering furtively from under the shadow of the alders, or "friezing" in his bed as you unconsciously pass by. He is an unsuspicious animal, and his stolid indifference is frequently mistaken for boldness. Often a band will stand stupidly gazing at the intruder while the latter shoots them down. But once fully aroused to the danger—once the telltale scent has reached their nostrils—no deer ever traveled half as far or rushed as madly onward. Once fairly started, no time is spent on doubling trails or backward glances; it is one blind, headlong dash for miles across the barrens. In the forests of New Brunswick moose come down every night to feed around the pond where lumbermen have worked and smoked all day. In the south deer may be jumped from your very doorstep, and only trot off a few rods before they forget all about it. But the wanderer of the northland loves to be alone, and shuns the habitations of men.

How marked is the contrast in the habits of the deer, moose, and caribou. During summertime, in Maine and New Brunswick, the former two may be seen in great numbers. Living around the edges of ponds and rivers, among the spruces and balsams and alder tangles, they come out at intervals to stand neck-deep in the water, while at night they crop the lily-pads and succulent grasses growing on the bottom. It is no unusual sight in July to see two or three bull moose standing shoulder-deep in the muck, with heads completely submerged be-

neath the surface, as they pluck young tender shoots from below. In fly-time deer and moose are semi-aquatic, but go to the same spot in October or November with your rifle, and where is the game? Tracks are there, it is true, for the sign is like that in a cattle-yard, but where are the bucks and bulls? Not around the water, but high up among the maples and birches of the hardwood ridges. With the caribou of Newfoundland, the reverse holds true. During the warmer months they are difficult to find during the daytime, and seek the seclusion of the thickest forest growth. Coming out at sundown they rarely roam far from the woods, and I have never seen one feeding in a pond. One will frequently walk around the edge of a lake or bog hole as if for exercise, and should the beach be broad and sandy, it will be found a favorite lounging place for large stags during the twilight and early morning hours. Such a spot, if regularly used by the animals, will prove the very finest watching place for early fall hunting during August, for at that time the caribou have not assembled on the highlands. The does and young stags, it is true, make excursions to the barrens every evening, returning to the woods usually by eight or nine o'clock in the morning, but the heavy old stags, with their short, thick legs and ponderous bodies, are lazy, and heartily dislike all such arduous work. In September, however, when moose and deer are difficult to locate, then the caribou stags are preparing to leave the forests and travel out into the open country. Little spruces are torn up bodily; the alders hang in tatters where big fellows rub their antlers, and before the middle of the month, hard and polished, they are brandished before the eyes of admiring does. The latter, with fawns and yearlings, have been waiting on the open country for a week or two; but now autumn has come and the barrens are dotted here and there with little herds and companies grazing about, the heavy old stags lazily bringing up the rear. This is the time for the man with a gun, and neither earlier nor later; antlers are peeled, and the fat venison, still untainted by the rut, is in prime condition. It is the merest murder to kill a stag during the rutting season in October, after which, in November, they are poor, thin creatures at best, while in December no trophies are carried on their heads.

The following paragraph contains the gist of an article written for FOREST AND STREAM last winter, which was intended to explain the game situation and hunting methods employed at present in the colony.

Nine-tenths of the people who go to Newfoundland are successful; the other tenth usually miss. For the large majority, however, real success exists only as far as the procuring of heads is concerned. Of course, if the ambition and desire of the sportsman is merely to get antlers the easiest possible way, the present method of taking game will strongly appeal to him—a method involving much killing but very little hunting. For a description of such sport, let the reader try the last few chapters of S. T. Davis' book entitled, "Caribou Shooting in Newfoundland." There are many men who go regularly every fall to the eastern end of Grand Lake or the vicinity of Howley and the Topsails, and return laden with spoils, well satisfied that they are real big-game hunters. The genuine sportsman, however, the man who places the killing after the hunting, who enjoys the stalking more than the shooting, whose success is only appreciated after a week or fortnight of hard tramping over a rough country, will hardly care for caribou hunting in Newfoundland as it is practiced at present. For, to use a phrase which I have often heard returning sportsmen apply to it, it is "not unlike shooting cows in a barnyard." I do not wish, however, to condemn the game of Newfoundland merely because it is too plentiful to afford good sport; such a situation would create a strange anomaly, indeed; but I deplore the present method of migration shooting compared with any other possible one.

If the reader will glance at a map of the colony, he will see on its western coast a long, narrow peninsula stretching one hundred and fifty miles northward to the Straits of Belle Isle and the southern extremity of Labrador. In this great tract thousands of caribou spend the summer months, and when the first autumn frosts commence to nip the vegetation they begin to move slowly southward. A very few undoubtedly spend the entire winter in the north, as shed antlers have often been found well up toward the Straits; but the great majority being migratory are compelled to cross the railroad track at the narrow base of this peninsula on their southern journey. During late September, October, and well into November, an almost continuous stream of the animals traverse the comparatively small area around Sandy Pond and Howley, and it is to such places as these that the majority of sportsmen repair. A camp is put up a few miles from the railroad track or on the shore of a neighboring pond, where the "deer," as the Newfoundlanders term them, are known to cross in numbers. Near-by the hunter takes his stand on the top of some neighboring hill or knoll, and waits for caribou to come along, scanning the barrens with field glasses, and choosing the head he desires. In the height of the season, forty or fifty are often in sight at once; the stags are thoroughly examined, the size of their antlers noted, and the one possessing the finest is accordingly singled out and shot. No particular skill is required to approach within one hundred or even fifty yards of his game, pro-

vided the hunter observes that cardinal rule, "keep well to leeward." Should the animal be approaching along a lead or runway, the sportsman's fire is reserved until he is absolutely certain to hit the mark. Even concealment is often unnecessary, for a caribou cannot, or at any rate does not, discriminate between a bush and a man at two hundred yards, provided the latter remains motionless. But even should he be detected, a good standing shot may generally be obtained while the animal stares stupidly at the intruder. During the rutting season the Government wisely prohibits all shooting whatever, as any would be the merest slaughter. At that time stags become very bold. With swollen necks and protruding tongues, they travel day and night; eating little or nothing, they soon become thin and poor, with hindquarters shrunk to half their natural size. Some years ago, when there was no close season, many an old stag met his death by means of a very simple deception practiced by the guide. The latter merely walked in a stooping posture, through bushes high enough to conceal his legs, with a pair of antlers held aloft. A dry branch of the proper shape was easier to obtain, and often answered the purpose just as well.

This method of having the game walk up almost within sight of his tent, will neither appeal to nor satisfy the man who wants real hunting. Dr. Paul Van Dyke tried it three years ago, and found it rather unsatisfactory. He tells me that the next time he goes to Newfoundland it will not be for migration shooting. Percy Selous, the famous African hunter, writes in The Wide World magazine of about a year ago that he was disgusted with the hunting methods employed at Howley, and for real sport took a trip to John's Pond, forty miles up the Terra Nova River.

Hitherto the prevalent notion among sportsmen has been that all the caribou migrate southward every autumn, returning the following spring; and they are right, to a certain extent. The deer do move south in the fall, but by no means do they all travel northward at the close of winter. The whole central and southern exterior, comprising one-half the area of the island, contains the year around vast numbers of non-migratory animals, or those which have lost the instinct to migrate. This great wilderness, almost unknown to sportsmen, is the permanent home of thousands of caribou which, never having seen the railroad, have consequently escaped the murderous fusillade at Grand Lake. And it is in the interior that the very finest heads are to be procured at the present time. The reason for this is obvious; herds which are accustomed to regularly cross the railroad track, have been examined with the glasses, and sorted over so often during the last ten years that many of the real old stags have long since fallen. It is true, small deer are still very abundant at Grand Lake, but the migration hunter after seeing twenty, thirty, or perhaps a hundred caribou every day of his trip, is surprised at the very small proportion of good heads.

One gentleman who recently returned from the island, counted 160 in ten days, only four of which proved worthy of a shot. Another saw eighty stags alone, to say nothing of does and fawns, yet he secured but one large head; he is a good shot, too. A third, Mr. Edward W. Scudder, of Newark, N. J., saw a large quantity of deer between Grand and Red Indian lakes, and he reports the proportion of old stags to be about one to forty or fifty.

These sportsmen, with many others whom I could name, hunted in September before the migration was well under way. Later in the "second season," during the latter part of October and early November, big stags are more in evidence, and easier to secure. But during any season there is no doubt that the grand old patriarchs—the forty and fifty-pointers—are not nearly as abundant as some years ago.

On the other hand, men who have penetrated into the interior report the proportion of good heads to be much greater than along the line of the railroad. Professor Thompson, of Princeton, secured three very fine sets of antlers with little difficulty; Percy Selous, hunting in the Terra Nova country, secured four; and in 1902, accompanied by Frank and Nevin Sayre, of South Bethlehem, Pa., I made a trip into the Middle Ridge region south of the Southwest Gander. In eighteen days we saw only about eighty caribou, as it was during late August and early September, before they had collected on the open country, but sixteen were well antlered stags, and we returned with our full quota. On our way in we met William M. Prest, of Boston, who had been hunting at Island Pond. He carried three first-rate sets, and saw several big fellows that escaped.

It is then to this vast central region—over twenty thousand square miles in extent, a country of unknown lakes and streams, of broad open barrens and rolling hills—that the sportsman is asked to direct his attention. At the falls I was already well within its boundaries, and in the heart of a first-rate caribou region, but the smoke and noise of a week had driven them from the immediate vicinity of the camp, so we decided to push on further into the interior, toward a range of hills that loomed up on the eastern horizon.

On the morning before the storm Jim had packed out a load of smoked salmon to the settlements, and as it was at least a five days' journey there and back, could hardly be expected to return before the morrow. Besides, the moss and "tucks" were saturated, and neither

makes the easiest kind of a carpet over which to tramp. It sounds very enticing in the railroad guide book when we read of "a delightful walk over the moss," but should the latter in places be nearly a foot thick, and as full of water as a wet sponge, fifteen or twenty miles with a fifty-pound pack create no very pleasant anticipations in the mind of a packer. With Jim we awaited a fresh supply of tea, "baccy," and baking powder, a few more trout flies, and my rifle, which had been left at his home on our way in, as being wholly superfluous while salmon fishing.

So William proposed pushing on that day to Andrew's Pond, some ten miles to the eastward, where caribou were always plentiful, and the brook trout had never seen the colors of an artificial fly. He carried the heavier pack, firmly secured after the Indian fashion with a tump line across his forehead, but I carried Jim's loose-locked muzzleloading shotgun with about eight loads of buckshot and exactly eleven caps. It was an old historic heirloom, and had killed hundreds of beaver in its day; but now, merely a worn out relic of the past, loose and rickety, and always guaranteed to do damage at either end. Vast barrens covered with rank wet moss stretched out before us, crossed and recrossed by well-worn deer leads, each trending in a different direction. Some of these runways were a good two feet deep and filled to the brim with muddy rain water; others, faintly discernible in the grass, showed fresh sign made the previous night. Once an old hen ptarmigan and her brood of nearly grown chicks, flushed with a noisy whirr from beneath our feet; but with this single exception, not a creature stirred over the desolate expanse.

It was well toward four o'clock when, rounding a great mass of boulders, the welcome sight of water greeted our eyes far below in the valley, and two hours later, emerging from the woods, we stood upon the shore of Andrew's Pond. Here occurred the most exasperating experience as a sportsman that it has ever been my misfortune to endure, and I will relate it in all its details. The pond was over a mile in length, surrounded on all sides by a thick, almost impenetrable, tangle of stunted spruce and balsam. At one end a gradually receding shore sloped down gently to the water's edge in a beach of white, hard sand a few yards wide and a quarter of a mile in length—just such a spot as caribou choose for an evening stroll. This beach was divided at its center into two separate stretches by the inlet of the pond, a stream some thirty yards wide; and the whole shore was covered with broad, cloven tracks, showing that more than one animal wandered by daily between sunset and dawn. A shotgun is hardly a dignified weapon for the pursuit of such noble game as caribou, and for such a purpose it is justly tabooed by sportsmen; but that particular evening William and I did not pose as sportsmen, but were content as pot-hunters pure and simple.

WILLIAM ARTHUR BABSON.

[TO BE CONTINUED.]

The Grape Vine Telegraph.

Editor Forest and Stream:

We would often wonder how our Indians always managed to find out all that had happened, or was going to happen, as soon as we knew it ourselves—often before even we knew it. We dubbed their source of information the "grapevine telegraph."

About 1877 Dull Knife's band of northern Cheyennes were sent from Camp Robinson, Nebraska, to join the southern Cheyennes at the Darlington Agency (Fort Reno) in the Indian Territory. They were never contented there, the climate was killing them, they said; and they had tried to go north again several times, but had always been driven back, and all through the summer of 1878 we were looking for them to make another attempt to go.

There were only two troops of cavalry at Reno to hold about 5,000 Indians here, and we had to watch these Indians closely. In the fall, about the first of October, I think it was, I was down at Fort Sill with two wagons after a load of lime, and was in camp below the post, when one morning just at daylight old Stumbling Bear, a Kiowa chief, paid the camp a visit. He was no doubt looking for his breakfast, as he would not go over one hundred miles out of his way at any time to bring me news. He never had had much use for me since the time several years before this when I had lined up a party of men I had out with his band to shoot him for disobeying my orders. Coming into camp after the usual "How," he said: "Mebbe so, Cheyennes go," pointing north. They had left late the afternoon before.

We had a telegraph line here, a single wire that we had put up ourselves; it ran from Gainesville, Texas, through Sill and Reno up to Fort Supply.

I went up to the office right-away and found the operator, an enlisted man, fast asleep. He had not heard from Reno since noon yesterday, he told me. "Going to his key while he was dressing, I began to call for 'R,' our signal at Reno, but could not get an answer. Then the operator took his key and continued to call, but he got no answer either. I thought I knew what was wrong. That operator at Reno belonged to our troop, and he was no doubt out after Indians now."

After a while we got a reply. "Someone who could telegraph had been hunted up." He was another telegrapher like myself—a slow one. After he had made several attempts at it, he told us that the Cheyennes had gone at last, and that our troop had followed them. There was not much more than half a troop there, thirty men, to follow anything; the rest of us were scattered all over the country on details just like mine, and the other troop dare not be sent also; if it had been sent, then other Indians, Cheyennes and Arapahoes, would have lost no time in going upon a raid to Kansas also.

The northern Cheyennes went clear across western Kansas, leaving a trail of fire and blood behind them, and were finally rounded up at Camp Robinson. The troop got in ahead of them once, and in the fight that followed lost one man, the blacksmith, but did not stop the Indians; they kept on burning ranches and killing settlers. The troop brought these Indians back, though, all except Dull Knife, he was kept up there a prisoner, and a new chief, Standing Elk, brought the band back. It took them about ten days to go up, and nearly as many weeks to come back again.

It is about seventy miles from Reno to Sill; some Indian rode his pony these seventy miles between dark and some time before daylight next morning and brought this news here. Some southern Cheyenne chief had sent him, with the expectation that the Kiowas would go out next, then the others here at Darlington would go.

CABIA BLANCO.

Nine Thousand Feet Above the Sea.

GARDNERVILLE, Nevada, July 4.—Editor Forest and Stream: Can it be possible on this glorious Fourth of July that anybody in Uncle Sam's vast domain is sweltering in heat or wishing for a cake of ice on which they may sit? Are any sick, or is life a burden or monotonous to any? I presume so; but it hardly seems possible viewed from this peak of the Sierra Nevadas. As I write the temperature suggests early spring. Vast banks of snow many feet deep lie close to camp, lending a freshness and vigorous life to this glorious atmosphere utterly indescribable. Are you sick or tired? Do you imagine you feel old age creeping over? Does the thought now intrude that after all your hopes and efforts, life is likely to prove a failure, and happiness and contentment as far away as when you began life's battle? If so, take the writer's advice and follow his example; pack your grip and also that of the partner of all your joys and sorrows; bid farewell to business for an indefinite period; say to care and worry, "Go to thunder!" and to ambition, "Get thee behind me, Satan, what canst thou avail me if I sacrifice health and strength and happiness and only grasp thee on the brink of the grave?" Then resolutely climb the highest peak of these grand old mountains; higher and yet higher, until you feel a new life entering in at your nostrils and vibrating through every fiber of your being; and there, where perpetual snow-banks gleam in the summer's sun, and countless flowers bloom between those banks of white, you pitch your camp, in an atmosphere so pure and surroundings so peaceful and healthful that the most hopeless invalid must feel a new life and fresh hope stealing over him.

In an atmosphere so pure as this, fresh meat will hang for weeks without tainting.

One can see from these snow-capped peaks range after range of rugged mountains, with beautiful and fertile valleys between. Lake Tahoe, although many miles distant, seems almost at our feet. The Sacramento Valley, although two hundred miles away, can be plainly seen; and it is said that on a clear day Salt Lake City and the Great Salt Lake, six hundred miles distant, can be seen from one of these peaks.

This is the season for fish in these mountain streams and lakes. He who has not wandered along the banks of a leaping, bubbling mountain stream, and felt the ecstatic chills chase up and down the spine as a splendid fish makes his grand rush, and the reel sings and the rod bends—he who has not felt these joys has failed to taste of some of the most exquisite thrills that man can feel.

Not far from where I write a beautiful little lake nestles in the mountain tops several hundred feet higher than Lake Tahoe, and is alive with speckled trout. Our mountain streams are stocked with a variety of trout which are peculiar to these mountains. They are a little larger than the eastern speckled trout, which they resemble very much in shape and general appearance, but lack the red spots. They are a very gamey fish, more so, if possible, than our eastern trout. In my next I will write of the game in these mountains.

Mrs. Thomas and I came here some months ago from Delaware in hope of regaining lost health, and the result has been more than could be expected. We live in an open tent, and have discontinued the use of medicine. I will be pleased to answer any questions concerning this country, its game, or other resources.

S. H. THOMAS.

Trails of the Pathfinders.—XII.

Lewis and Clark.

(Concluded from page 6.)

THE winter was spent chiefly in procuring food, and in observing the natives, and the geography of the neighboring country, and the expedition has not expected to leave their permanent camp, Fort Clatsop, before the first of April. By the first of March, however, the elk, on which they chiefly depended for food, had moved away to ascend the mountains, and their trade goods being almost exhausted, they were now too poor to purchase food from the Indians. It was evident that they must start back up the river, in the hope of there finding food, and must reach the point where they had left their horses before the Indians there should have moved off across the mountains or dispersed over the country.

During the winter they had worked hard at dressing skins, so that they were now well clad; and had besides three or four hundred pairs of moccasins. They still had also 140 pounds of powder and about twice that weight of lead, enough to carry them back.

On the 23d of March, therefore, after giving certificates to some of the Indian chiefs, and leaving tacked up on one of their cabins a notice of their successful crossing of the continent, and their start back, they took leave of the Indians, and set out in two canoes up the Columbia. As they passed along they at first found little difficulty in securing provisions from the acquaintances they had made while descending the river; and besides this, the hunters killed some game. Before long, however, they began to meet Indians coming down the river who informed them that they had been driven from the Great Rapids by lack of provisions, their winter store of dried fish having become exhausted, and the salmon not being expected for a month or more. This was dismal news to people who were ascending the river in the hope of obtaining provisions, but there was nothing for them to do except to keep on, living on the country as well as they could, trying to reach the place where they had left their horses before the Indians should have departed. Their hunters succeeded in killing some deer and elk on the south side of the river, though there seemed to be no game on the north. Besides that, the deer killed were so extremely thin in flesh that it hardly seemed worth while to bring them into camp.

Many of the Indians still stood in great fear of the "medicine" of the white men; and Captain Clark, returning from a short exploring trip, saw an example of this: "On entering one of the apartments of the house, Captain Clark offered several articles to the Indians in exchange for wappatoo; but they appeared sullen and ill-humored, and refused to give him any. He therefore sat down by the fire opposite to the men, and, drawing a portfire match from his pocket, threw a small piece of it into the flames; at the same time he took out his pocket compass, and by means of a magnet which happened to be in his inkhorn, made the needle turn round very briskly. The match immediately took fire, and burned violently, on which the Indians, terrified at this strange exhibition, brought a quantity of wappatoo and laid it at his feet, begging him to put out the bad fire; while an old woman continued to speak with great vehemence, as if praying and imploring protection. After receiving the roots, Captain Clark put up the compass, and, as the match went out of itself, tranquillity was restored, though the women and children still sought refuge in their beds and behind the men. He now paid them for what he had used, and, after lighting his pipe and smoking with them, continued down the river."

The hunters still were killing some game, but it was so thin as to be unfit for use; six deer and an elk were left in the timber, while two deer and a bear were brought in. The wappatoo was now largely the food of all the Indians; the bulb, which grows in all the ponds of the interior, is gathered by the women, who, standing in deep water, feel about in the mud for the roots of the plant, and detach the bulbs with their toes; these rise to the surface and are thrown into the canoe. The roots are like a small potato, and are light and very nutritious.

A few days later they obtained from the Indians the skin of a "sheep" (mountain goat), which is described so that there is no doubt about the identification. The hunters also killed three black-tailed deer. Near Sepulcher Rock, a burial place for the surrounding tribes, Captain Clark crossed the river in the endeavor to purchase a few horses, by which they might transport their baggage and some provisions across the mountains, but in this he was unsuccessful. However, some Indians were met, who promised a little later to meet them and furnish some horses. At the foot of the Great Narrows four were purchased to assist in carrying the baggage and the outfit over the portage.

The Indians at the upper end were rejoicing over the catching of the first salmon; and they were so good-natured that they sold the white men four more horses for two kettles, which reduced the stock of kettles to one. There was a good deal of trouble here from thefts by the Indians, and from their practice of trading articles and then returning and giving back the price that they had received and demanding articles that had been traded. So annoying did this become, that Captain Clark declared to the Indians in council assembled that the next man caught stealing would be shot; and a little bit later he was obliged to threaten to burn the village. At last, however, they got away, with ten horses, and proceeding up the river secured a few others. By this time they had exhausted pretty much all their trade goods, and the capacity to buy was about at an end. The Indian tribes that they were passing now did not seem to be particularly friendly, and held themselves aloof; but a chief of the Walla Wallahs, whom they met a little later, treated them most hospitably, and in striking contrast to the people that they had lately seen. This chief presented Captain Clark with a fine horse, and received in return a sword, one hundred balls, some powder, and some other small presents. The chief helped them cross the river in his canoes, and they camped on the Columbia, at the mouth of the Walla Wallah River. They now possessed twenty-three horses, and on the whole were in pretty good shape, except that they had but little food, and had nothing left which they could trade for food. About the first of May they met a party of Indians, consisting of one of the chiefs of the Nez Percés who had gone down Lewis River with them the previous year, and had been of great service to them, and who, hearing that they were returning, had come to meet them with ten young men. They were now out of provisions, but at an Indian camp not far off managed to obtain two lean dogs and some roots. As they went on they learned that most of the Nez Percés were scattered out gathering spring roots, but the Indian in whose charge their horses had been left was not far away.

At this point the explorers were applied to by the two or three persons who were ill, and their simple treatment benefiting the Indians, their fame greatly increased. The white men were careful to give the Indians only harmless medicine, trying to assist nature rather than to do anything that was radical. The Indians who had been benefited gave material evidence of their gratitude. Since they had been on the Columbia River the Indians had made great fun of the white men because they ate dogs, and it was just after their experience in doctoring, but at another village, that "an Indian standing by, and looking with great derision at our eating dogs' flesh, threw a poor half-starved puppy almost into Captain Lewis's plate, laughing heartily at the humor of it. Captain Lewis took up the animal and flung it back with great force into the fellow's face, and seizing his tomahawk, threatened to cut him down if he dared to repeat such insolence. He immediately withdrew, apparently much mortified, and we continued our dog repast very quietly." Continuing their journey, they were again applied to for medical advice and assistance, but declined to practice without remuneration. One or two small operations were performed; and a woman who had been treated, declaring the next day that she felt much better, her husband brought up a horse, which they at once killed.

Having crossed the river, on the advice of the Indians that more game was to be found, they kept on their way, and the day after the hunters brought in four deer, which, with the remains of the horse, gave them for the moment an abundant supply of food. Here they met Twisted Hair, in whose charge they had left their horses, who told them that, owing to the care that he had taken of their horses, he had been obliged to quarrel with other chiefs, who were jealous with him, and that finally he had given up the care of the horses, which were now scattered. They soon recovered twenty-one of their horses—most of which were in good condition—a part of their

saddles, and some powder and lead, which had been put in the cache with them. The Indians gave them two fat young horses for food, asking nothing in return, and the hospitality and generosity of these Indians made a great impression on the white men, who were now disposed to treat them with a great deal more courtesy and consideration than had been their custom. Captain Lewis at this meeting is quite enthusiastic about these Chopunnish Indians, whom he describes as industrious, cleanly, and generous—a report quite different from that made on the way down the river.

At the village where they camped May 11, the Indians lived in a single house, one hundred and fifty feet long, built of sticks, straw and dried grass. It contained about twenty-four fires, about double that number of families, and might muster, perhaps, one hundred fighting men. The difficulty of talking to these Indians was great, for Captains Lewis and Clark were obliged to speak in English to one of the men, who translated this in French to Chabonneau, who interpreted to his wife in Minnetari, she told it in Shoshoni to a young Shoshoni prisoner, who finally explained it to the Nez Percés in their own tongue. After the council was over, the wonders of the compass, the spyglass, the magnet, the watch, and the air-gun were all shown to the Indians. Here they were obliged also to do a good deal of doctoring, and finally another council was held, at which it was agreed by the Indians to follow the advice of Captains Lewis and Clark. Presents were made by the Indians to the whites; and to each chief was given a flag, a pound of powder, and fifty balls; and the same to the young men who had presented horses to them. They also paid the man who had charge of their horses, in part, agreeing with him to give the balance so soon as the remainder of the horses were brought in.

On the 14th of May they crossed the river and made a camp, where they purposed to wait until the snow had melted in the mountains. The hunters killed two bears and some small game, much of which they gave to the Indians, to whom it was a great treat, since they seldom had a taste of flesh. Many patients continued to be brought to them whom they doctored, and with some success.

Early in June they began to make preparations to cross the mountains, though the Indians told them it would be impossible to do this before about the first of July. They were now well provided with animals, each man having a good riding horse, with a second horse for a pack, and some loose horses to be used in case of accident, or for food. The salmon had not yet come up the river. They started on the 15th of June in a rain, and on the way found three deer, which their hunters had killed. They soon began to climb the mountains, and before long found themselves traveling over hard snow, which bore up their horses well, but it was evident that the journey would be too long to make, since for several days' travel there would be no food for the animals. So they were obliged to turn back and wait for the warmer weather.

Two men who had been sent back to the Indian village to hurry up the Indians who had promised to cross the mountains with them, and make peace with the Indians on the Upper Missouri, returned with three Indians, who agreed to go with the party to the falls of the Missouri in consideration of receiving two guns. They pushed along over the mountains, usually keeping on the divide, to head all streams and not cross any running water. The country was completely covered with snow. On the 26th of June they camped high up on the mountains, where there was good food for the horses. The traveling was pleasant, the snow hard. Their provisions had now about given out, however, except that they still had some roots; but now and then a deer was killed, which kept them from absolute starvation.

By July 1 they had reached a country where game was quite abundant, deer, elk and big-horn being plenty in the neighborhood. It was determined to divide the party, and to cover more country on the return than they had when coming out. Captain Lewis, with nine men, was to go to the Falls of the Missouri, leave three men there to prepare carts for transporting baggage and canoes across the portage, and with the remaining six to ascend Maria's River and explore the country there. The remainder of the party were to go to the head of the Jefferson River, where nine men under Sergeant Ordway should descend it with the canoes. Captain Clark's party was to go to the Yellowstone, there build canoes, and go down that river with seven men; while Sergeant Pryor, with two others, should take the horses overland to the Mandans; and thence go north to the British posts on the Assinaboine, and induce Mr. Henry to persuade some of the Sioux chiefs to go with him to Washington. This plan was carried out.

Captain Lewis's party kept on their way until they reached Dearborn River; but before they got to it they saw signs of buffalo, and even had glimpses of the game. They were now in a good game country, and made rapid progress, and before long found themselves at their old station, White Bear Island. During the flood of the river the water had entered their cache and spoiled much of their property. They had much trouble here with lost horses, and one of their men, riding suddenly upon a bear, his horse wheeled and threw him, and the bear drove him up into a tree, where he was kept all day.

Captain Lewis now started to explore the Maria's River, and, pushing his way up it, almost reached the foot of the Rocky Mountains. Here they met a band of Indians, who stated that they were Gros Ventres of the prairie, or, as Lewis and Clark put it, Minnetari of Fort de Prairie; and who, after some hesitation, appeared to be friendly enough, and smoked with Captain Lewis. They expressed themselves as willing to be at peace with the Indians across the mountains, but said that those Indians had lately killed a number of their relations. However, white men and Indians came together, but Captain Lewis kept a very close watch, fearing that the Indians would steal his horses. This did not happen, but on the following day, July 27, the Indians seized the rifles of four of the party. As soon as Fields and his brother saw the Indian running off with their two rifles they pursued him, and overtaking him, stabbed him through the heart with a knife. The other guns were recovered without killing any of the Indians; but as they were trying to drive off the horses, Captain Lewis ordered the men to follow up the main party, who were driving the horses, and shoot them. He himself ran after two other Indians,

who were driving away another bunch of horses, and so nearly overtook them that they left twelve of their own animals, but continued to drive off one belonging to the white men. Captain Lewis had now run as far as he could, and calling to the Indians several times that unless they gave up the horse he would shoot, he finally did so, and killed an Indian. The other men now began to come up, having recovered a considerable number of the horses; they had lost one of their own horses and captured four belonging to the Indians. They now retreated down the river with the horses that they had, but took nothing from the Indians' camp.

These Indians were probably not Gros Ventres, as stated in the Lewis and Clark journal. Precisely the same story was told me fifteen or twenty years ago by the oldest Indian in the Blackfoot camp, as having happened on Birch Creek, a branch of the Maria's. The Indian killed by Fields was named Side Hill Calf, and the aged man who related the story said that he was a boy with the Indian war party.

Captain Lewis, believing that they would be promptly pursued by a much larger party of Indians and attacked, at once began a retreat. The Indian horses which had been captured proved good ones, the plains were level, and they rode hard for more than eighty miles, only stopping twice to kill a buffalo and to rest their horses. They stopped at two o'clock in the morning, and at daylight started on again, and at last when they reached the Missouri they heard the report of a gun, and then others, and before long had the satisfaction of seeing their friends going down the river. They landed, and Captain Lewis's party, after turning loose the horses, embarked, with the baggage, and kept on down the stream. Before long they met Sergeants Gass and Willard, who were bringing down horses from the falls, and now the whole party had come together, except Captain Clark's outfit, which had gone down the Yellowstone.

The journey down the Missouri was quickly made, and at the mouth of the Yellowstone a note was found from Captain Clark, who had gone on before them. Not far below this Captain Lewis, while hunting elk on a willow grove sandbar, was shot in the thigh by his companion, Cruzatte, who apparently mistook him for an elk, he being clad in buckskin. At first Captain Lewis thought that they had been attacked by Indians, but no signs of Indians being found, the conclusion that Cruzatte had shot him, apparently by mistake, seemed inevitable. On August 12 they met Captain Clark's party, whose adventures had been much less startling than theirs. His party had started up Wisdom River, on the west side of the mountains, and crossing over to the head of the Jefferson, had passed through a beautiful country—the Beaverhead—very lovely in its surroundings, with fertile soil, and abounding in game.

Most of the party had gone down the river in canoes, but a few men had been left on the land to drive down the horses. A part of these, under Sergeant Ordway, kept on down the river, while at the mouth of the Madison, Captain Clark, with ten men and the wife and child of Chabonneau, taking the fifty horses, crossed over to go to the Yellowstone and descend it. When they reached the Yellowstone, they followed it down for some little time, through a country abounding in buffalo, deer and elk. Very likely they would have gone on further but for an accident to one of the men, who was so badly hurt that he could not sit on his horse. Small timber being found, canoes were constructed, which were lashed together and loaded preparatory to setting out. While all this was being done, twenty-four of their horses disappeared, and a little search showed a piece of rope and a moccasin, which made it clear that the horses had been run off by the Indians. Sergeant Pryor, with two men, was ordered to take the remaining horses down the river to the mouth of the Bighorn, where they should be crossed, and from here he was to take them to the Mandans. The canoes which went on down the river passed various streams, and at one point came upon what appeared to have been a medicine lodge of the Blackfeet. At a stream to which they gave the name of Horse Creek, they found Pryor with his animals. He had had much trouble in driving the horses, since, as many of them had been used by the Indians in hunting buffalo, whenever they saw a bunch of buffalo they would set off in pursuit and surround them. To prevent this, Sergeant Pryor was obliged to send one man ahead of the horse herd to drive away the buffalo.

From the top of Pompey's Pillar Captain Clark had a wide and beautiful prospect over the country, dotted everywhere by herds of buffalo, elk, and wolves. Bighorn were abundant here and further down the stream, and the noise of the buffalo—for this was now the rutting season—was continuous. The large herds of elk were so gentle that they might be approached within twenty paces without being alarmed. The abundance of buffalo was so great that the travelers were in great fear, either that they would come into their camp at night and destroy their boats by trampling on them, or that the herds, which were constantly crossing the river, would upset the boats. Bears, also, were very abundant, and quite as fierce as they had been on the Missouri. Captain Clark killed one, the largest female that they had seen, and so old that the canine teeth had been worn quite smooth. Mosquitoes here were terribly abundant; several times, it is said, they lighted on the rifle barrels in such numbers that it was impossible to take sight.

On August 8 they were joined by Sergeant Pryor and his men, who had no horses; every one of them had been taken off the second day after they left the party by Indians. They followed them for a short distance, but without overtaking them; and finally coming back to the river, built two rowboats, in which they came down the stream with the utmost safety and comfort. On the 11th of August they met two trappers, who had left Illinois in the summer of 1804, and had spent the following winter with the Tetons, where they had robbed and swindled a French trader out of all his goods. They told Captain Clark that the Mandans and Minnetaries were at war with the Arikaras, and had killed two of them; and also that the Assinaboines were at war with the Mandans, news which could not have been very pleasing to the explorers, whose efforts on their way up the river had been so strong for peace.

The party having come together on August 12, they kept on down the river, and two days later reached the village of the Mandans. Here they had protracted coun-

cils with the Mandans and Minnetaries, and tried hard to persuade some of them to go on with them to Washington. Colter applied to the commanding officers for permission to join the two trappers who had come down the river to this point, and he was accordingly discharged, supplied with powder and lead, and a number of other articles which might be useful to him. The next day he started back up the river. What Colter's subsequent adventures were is well known to anyone who has followed the course of early exploration in the West. Colter's Hell, if we recollect right, was perhaps the first name ever applied to the geyser basins of the Yellowstone Park.

Though the Mandans and Minnetaries were friendly and hospitable as possible, and gave them great stores of corn, none of the principal men would consent to go to Washington. They promised, however, to be more attentive to the requests of the white men, to keep peace with their neighbors, and were greatly pleased and proud of the gift to the chief of the Minnetaries, Le Borgne, of the swivel, for which Captain Clark no longer had any use, as it could not be discharged from the canoes on which they were traveling. Here, too, they discharged their interpreter, Chabonneau, who wished to remain with his wife and child. One of the chiefs, Big White, consented, with his wife and child, to accompany the white men. Before the expedition finally left the village there was a last talk with the Indians, who sent word to the Arikaras by Captain Clark, inviting them to come up and meet them; that they really desired peace with the Arikaras, but that they could place no dependence on anything that the Sioux might say.

Keeping on down the river, they found game plenty, and the mosquitoes troublesome. At the Arikara village they were well received, and found there a camp of Cheyennes, also friendly. The Rees expressed willingness to follow the advice that Captain Clark had given them, but made many excuses for the failure to follow their counsels of the year before. The Cheyenne chief invited the white men to his lodge, and Captain Clark presented a medal to the chief, to that individual's great alarm, for he feared that it was medicine, and might in some way harm him. The Cheyennes are described as friendly and well-disposed, though shy. The trip down the river was unmarked by adventure. Enormous quantities of buffalo were seen, and on the 30th of August they came upon a party of Teton Sioux, under a chief called Black Bull. Other Sioux were seen, and on September 3 they came to the trading post of a Mr. James Airs, who presented each of the party with as much tobacco as he could use for the rest of the voyage, and also gave them a barrel of flour. Below the mouth of the Big Sioux River they passed Floyd's grave, which they found had been opened. Two days later they passed the trading post of one of the Choteau, and a little later the Platte; and at last, on September 20, reached the little village of La Charette. On September 23 they reached St. Louis, and went on shore, where they received "a most hearty and hospitable welcome from the whole village."

GEORGE BIRD GRINNELL.

Concerning Taking Vacations.

WYMORE, Nebraska, July 14.—*Editor Forest and Stream:* After reading some of the communications in *FOREST AND STREAM* lately on the subject of "Vacations," I am pleasantly reminded of a little story I once heard, which ran about as follows:

In a small western city there once lived a man by the name of Jones, called by his acquaintances "Old Jones," who was very wealthy. The amount of his wealth could only be surmised, as he kept his business entirely to himself.

In the course of time he died, and speculation was rife as to the amount of property he left.

Then another citizen by the name of Smith said he could find out how much property old Jones had left, because Judge Brown was a friend of his, and the Judge had written old Jones' will. So Smith called upon Judge Brown, and after some preliminaries, he said: "By the way, Judge, you wrote old Jones' will, did you not?"

Judge Brown then said, "Yes, sir, I wrote the will." Then Smith said: "Well, Judge, how much did the old man leave?"

And the Judge said, "Oh, he left all he had."

A. D. McCANDLESS.

Natural History.

The Frog's Provender.

OSSINING, N. Y., July 16.—*Editor Forest and Stream:* In your issue of July 16, I notice articles on the food of frogs and suspended animation in fishes, both of which I can corroborate. Among other articles of diet I have found inside large frogs numerous crawfish, a few small turtles, not quite as large as a silver half dollar, a fish (probably a chub) nearly as long as the body of the frog that had swallowed it, and a sandpiper.

One summer while occupying a cottage on Rainbow Lake in the Adirondacks, I became personally acquainted with two batrachians. The acquaintance was formed through the medium of a slender white float which I had whittled out of a pine stick. While fishing at the boat landing for sunfish the float was kept constantly in motion by the fish nibbling at the bait. Soon I noticed a frog approaching the float by swimming under water, rising to the surface to take observations, and again advancing. When within about a foot of the float, he sprang, seized it, and endeavored to swim away with it. This was repeated two or three times, until froggie became disgusted, when he dived and disappeared. Next day he repeated his visit, and by drawing the float in I lured him to within four or five feet of the landing. I then immersed my hand in the water, leaving the ends of the fingers about half an inch above the surface, and waving them quickly about. After a few seconds he made a spring, seized my thumb, and shook it viciously. After trying this a few times, he allowed me to place my hand under him and raise him a few inches above the surface, where he would sit contentedly. Next day another frog

appeared and attempted to approach the float, but frog No. 1, with a savage rush, chased him away.

Not long after this one of our party shot a red squirrel, and his skin (turned inside out) was thrown into the water. Soon a number of sunfish were pulling it about, and that was the signal for frog No. 1. This time he approached boldly on the surface, caught hold of the moving skin, shook it, pushed it with his forefeet, and endeavored to swim away with it. After a few ineffectual efforts to swallow it, he abandoned it and disappeared. I have known frogs to snap at worms, red flannel, artificial flies, bare hooks, and lead sinkers, and I believe they will endeavor to swallow any moving object that comes within their reach, and that is not too large.

Turtles and frogs are very much attached to each other, and if opportunity offers, it is only the question of size as to which shall occupy the outside position, and which shall be strictly in it.

Regarding suspended animation in fishes, I have seen catfish which had been speared through the ice, frozen stiff, left in that condition over night, and on being thawed out in cold water swim around, apparently little the worse for their treatment.

EDWARD F. BALL.

BROOKLYN, N. Y., July 17.—*Editor Forest and Stream:* In your issue of the 16th inst., I notice with interest G. B. G.'s note on the frog's provender. In substantiation I cite the following, which might prove interesting to some of your readers. Along back in the '60s, an acquaintance of mine resided at West Hills, just back of Huntington, L. I., on the old Cold Spring Harbor road. Opposite his pasture lot was an old pond, where his cattle watered and his ducklings took their first lessons (and generally their last) in aquatic accomplishments. Through this pond ran an old division post and rail fence, the bottom rails of which were partly submerged, leaving the upper surface above water exposed to the sunlight. Here during the greater part of the day the frogs—great green fellows, with voices like fog-horns—could be seen basking in the sun. One day as I passed on my way to shoot woodcock, I noticed a fine brood of ducklings sporting in the water, and as I gazed a ripple appeared, and a duckling disappeared beneath the surface and did not return. Shortly after another frog mounted the rail, looking pretty self-satisfied. Two more ducklings disappeared, and a little later two more frogs as big as good sized kittens mounted the rail. I moved around the pond so as to get a raking fire on the rail, which held ten big frogs; I raised my gun—a 12-gauge muzzleloader—pulled into them, and got nine of them. Smith, who had witnessed the performance, came running out, crying, "Soak it to 'em, Doc. Consarn them critters! So them's the fellers I been raisin' ducks fur!" Just then a big frog paddled up on the rail, Smith's 10-gauge went "ka-souse," and Spangles went to the bottom like a deep sea lead. We fished them out later and their hindlegs, nicely browned in pork fat, were certainly a delicacy; and why shouldn't they have been, considering the nature of their diet?

G. W. BEATTY, M.D.

Tenacity of Insect Life.

My attention was called the other day to an instance of extreme tenacity of life in an insect. I saw a long, slender, very active insect rambling over the inside of the wire window screen in my room, evidently trying to get out. The creature was fully an inch long, the greater part of that length being undoubtedly devoted to digestive purposes, and attached by a very slender articulation to the chest or the upper section of the insect. I have never made any study of entomology, and cannot identify this creature. It had a number of long, slender legs, and long, gauzy wings. It was only a common, everyday summer insect, a specimen of one of the numerous species that are hovering about constantly in warm weather, and adding anything but pleasure to human existence.

Well, I didn't want the insect in my room, and taking up the stick of a burned match I watched my opportunity and drew the end of the stick across the creature just at the point of articulation, and cut it in two. I expected to kill the insect at once. The lower and main portion of its body fell to the window-sill, but, to my surprise, the remaining part of the insect went ahead flitting over the window screen just as if nothing had happened. I waited some time to see what would take place, and then, to put an end to the mutilated creature, I drew the match stick again across its body just back of its wings, cutting it again in two, but the upper part, now consisting of nothing but its shoulders, if an insect can be said to have shoulders, head, wings, and perhaps a pair of legs, kept on flitting over the screen as lively as ever.

My heart smote me. I was sorry for the poor thing, if it was only a troublesome summer fly. I desired to kill it, not torture or mangle it. Finally I was compelled to grind what remained of it to powder before life was extinct. I thought it a remarkable case of tenacity of life, and I have thought since that it was perhaps worth making a note of, as a slight contribution to the general stock of knowledge of natural history.

T. J. CHAPMAN.

Ducks Can Smell—and so Can Bears.

"Truth crushed to earth will rise again," Coahoma to the contrary on the duck smelling proposition notwithstanding. They think so at Currituck and as well down on the east coast, where they fix their decoys and blinds so as to carry the least scent to the ducks. However, we will not revert to Limburger, but turn to pleasanter things.

Silver-tips—synonymous with the grizzly of the vulgus—and black bears do not play peaceably in the same yard; at least they frequently disagree, from what I can understand from a friend, when they meet at the trysting place of the Yellowstone bears, the garbage-pile back of the hotel.

Down the hill comes a shambling black *Ursus*, sniffing the good things among the refuse and sails in. With his nose deep into the Lord knows what, and smeared to his eyes, he lifts his head, gives a grunt, and shambles up a near-by tree, hugging it, and looking all the world as if his hide had been tacked up to dry. The cause—a pair of young silver-tip cubs now coming on the scene. The black bear sizes them up, and with a disdainful sniff descends the tree with much scratching of the bark, and

again sails into the mass of refuse and pays no attention to the rooting cubs not far away. Many minutes have not elapsed before black bruin lifts his smeared snout high in the air, and with a grunt of rage he hikes the other way—not climbing a tree this time—as only a scared bear can, as six immense silver-tips emerge from the woods into plain sight. Evidently that *Americanus* could smell more than one odor at the same time, and knew how to distinguish.

I can't keep bringing in this Limburger, but I knew of a case where the boys "had it in" for a German sportsman, and how they saw to it that when going quail shooting his dogs, before starting, got a piece of Limburger deftly wrapped in a wad of rye bread. The theory was that it would ruin the nose of the dogs for the day, and as the man was a good shot and had good dogs and shot over a good quail country and never brought home more than half a dozen, the boys said their theory held good in practice. And this leads me to ask myself the question as to what would have happened had that big black bear been reveling in a stray piece of Limburger and had failed to smell anything else? How could he smell anything else? What would have happened had that herd of gigantic silver-tips advanced upon him unawares? The Roman arena with its wild animal fights would not have been in it; but I am afraid it would have been all up for the black one, unless he could have found a friendly tree at hand.

As it is a rule of the Park to invite no such hostile encounters, I hope the keeper may take warning and see that in all cases refuse Limburger be not thrown on the garbage heap, but be cached good and deep, and thus may all trouble be avoided.

CHARLES CRISTADORO.

Whippoorwill, Night-hawk, Bullbat.

OLCONA, Pa.—The following incident prompts me to ask, Are not the night-hawk and the whippoorwill one and the same? Something over twenty years ago, while seated with a comrade in the doorway of a northern Pennsylvania lumber camp, our attention was attracted by an unusual number of night-hawks foraging for their evening meal, just between sunset and dusk. The main flock drifted to a distant part of the valley, but a few remained to flit and dart almost directly over the camp. Suddenly one of the number dropped, with that unmistakable whizzing of the wings mentioned by Nuttall, alighted on a plank at our feet, and at once began piping his troubles in that oft-repeated whippoorwill. This he continued at intervals for fully five minutes before flying away, and in full view where even his eyes and every marking upon him were distinctly visible.

E. D. L.

BERRYVILLE, Va.—I would like to have the oft-discussed argument decided. Is the bullbat, so familiar to us here in the valley of Virginia, identical with the whippoorwill so often found in low places and near water? Rarely are the plaintive notes of the whippoorwill heard here, and yet there are hundreds of bullbats seen darting in all directions during the entire summer, whereas near the Potomac and Chesapeake Bay the cry of the whippoorwill is heard incessantly.

E. A. L.

[Bullbat and night-hawk (*Chordeiles virginianus*) are one species; whippoorwill (*Antrostomus vociferus*) another. The two birds are easily distinguished if held in the hand, but if seen flying at a distance a practiced eye would be required to say which was which. Why does E. D. L. think that the bird which gave the whippoorwill call was a night-hawk?]

That Nursing Kitten.

WYMORE, Nebraska, July 14.—*Editor Forest and Stream:* I was interested at once in the story of Mr. C. H. Ames in regard to the queer nursing habits of his kitten, and I think I can help him out. The kitten is afflicted with the disease which may be described as wind-sucking. A horse afflicted in this way is called a stumpsucker. The disease among horses is quite destructive in Pennsylvania, but almost unknown in Nebraska, because we have no stumps.

Speaking of stumps, reminds me of a visit I took to an uncle of mine in Iowa when I was a boy. I spent some weeks there, and one day I went to Van Meter to mill, with a neighbor boy. Van Meter was on Coon River, west of Des Moines, and to reach it we had to go through a great deal of timber. There was an old settler in the neighborhood by the name of Stump, who owned several pieces of that timber. As we passed from one place to another on our road, the boy with whom I was riding told me the names of the owners of the various places; and finally coming to a piece of land from which the timber had all been cut and the stumps left standing, I asked the boy whose land it was, and he said, "This is old Stump's timber." Thinking he was getting off a pun at my expense, I swatted him at the butt of his right ear, and just then the board that we were using for a seat slipped off the wagon box at his end and dropped him into the bottom of the wagon, and naturally let me fall on top; and I soon realized that it was a good thing that the seat dropped at his end instead of mine, as he proved to be one of those erratic creatures who don't know when they are licked.

A. D. MCCANDLESS.

Colors of Birds in Captivity.

ALL keepers of avaries or zoological gardens know how difficult it is to keep fresh and bright the color of brilliantly plumaged birds. Those which are generally red in color are the most easily affected by captivity, and there is no more familiar example of this than is offered by the flamingoes or the scarlet ibises seen in our zoological parks.

A recent article of some length in the London Field discusses this question and instances a great number of birds in which changes take place in captivity.

We have always supposed that the change in color in case of the flamingo was due to the lack, in captivity, of some food which the wild birds commonly eat; and, indeed, no more than this appears to be known by the writer of the article in question, who suspects that live food or natural food has much to do with the retention of their color by birds of high plumage.

Can Quail Move their Eggs?

MCCONNELLSBURG, Pa., July 15.—*Editor Forest and Stream:* I wish to submit the following for the consideration of your readers.

Yesterday morning, July 14, while Mr. Dan F. Trout, of Willow Home farm, just on the edge of our town, was engaged in mowing clover, his machine passed over a quail's nest containing sixteen eggs. The old bird flew away uninjured, after going through the usual performance to entice him away from the nest. He dismounted from the machine, counted the eggs, and carefully placed some hay over the nest in such a way as to protect it from the sight of crows. Then he marked the place with a stick and did not return until 2 P. M., when he found but eleven eggs left in the nest.

He carefully removed one of the eggs and broke it, finding within a young quail just formed. At about 5 o'clock P. M. he again returned to the nest and found but two eggs remaining, and saw two old birds rise from the stubble close by and fly away.

At 7 P. M., upon visiting the nest, the eggs had all been removed; no broken shells whatever remained in the nest, and as Mr. Trout had "kept an eye" in the direction of the nest all day, he is positive that no crows could have carried away the eggs or destroyed them.

It is very evident to me that the heads of this quail family carried those eggs away to a place of safety, but I submit the facts to you and your readers, knowing full well that the matter will be settled even beyond the faintest shadow of a doubt.

LESLIE W. SEYLAR.

Migrations of Martins.

MORGANTOWN, W. Va.—A well known local sportsman, Capt. Joe R. Miller, is asking the question, "Where do the martins go?" It is said that there are only two known places in the world which they inhabit—the United States and China. They are never seen to migrate from one locality to another. They are said to leave the Southern States at the same time they do in the North, and when they have left one locality in the fall they apparently leave the whole of the United States and are seen no more until the next season, and what the Captain wants to know is, where do they go? Anyone giving an answer to this query will have the thanks of those interested. The Captain has a pet theory of his own in regard to the matter, which we will withhold until some other light is given.

EMERSON CARNEY.

[Martin is a generic term applied to several species of the swallow family. We have house martins and sand martins, the name martin apparently being derived from the German *martern*, to torment, and presumably referring to the pugnacious disposition of swallows, and their readiness to attack and drive away the larger birds which venture near their homes. Our house martin goes south in winter, and is found in Mexico; the Cuban martin is found in Florida and Cuba, while another form inhabits southern Mexico, Central America, and northern South America.]

A Mephitic Alignment.

AN occasional correspondent, Wm. B. Boardman, of Minneapolis, is fond of natural history, as his distinguished father was. "The other day," he writes, "I saw a funny sight while out riding with my family. Just on the edge of Fort Snelling we surprised a litter of four skunks in a little opening about fifty feet from the road. When they heard us they all got in a row, facing us, with their tails high in the air. I regretted exceedingly that I did not have a camera along so as to take a snapshot at them, as they would have made a unique picture." Fortunate, perhaps, that they did not take a snapshot at him! When an essence peddler gets his range finder in position, he is ready for action.

100 Sportsmen's Finds.

Some of the Queer Discoveries Made by Those Who Are Looking for Game or Fish.

99

JOHN BIDDLE, of Mine Hill, N. J., caught in Budd's Lake, on Sunday, July 11, a 12-pound pickerel, in the stomach of which was found a watch stolen from her three years ago.

The Biddle home was robbed of all the jewelry in it by a burglar, who, when caught, said that he had rowed out into the middle of Budd's Lake and dumped the stuff overboard. He was convicted and sentenced, but none of the plunder was recovered until the watch was so strangely restored to Mrs. Biddle. She thinks of fishing every day to see if she cannot recover the rest of her jewelry.

DR. CHARLES RICHEL, a French statistician, estimates the number of men who died in the wars waged by Christian nations during the last century to be 14,600,000. The estimate is made up as follows: Napoleonic wars, 8,000,000; Crimean war, 300,000; Italian war, 300,000; American Civil War, 500,000; Franco-German war, 800,000; Russo-Turkish war, 400,000; civil wars in South America, 500,000; various colonial expeditions in India, Algeria, Mexico, Tonquin, Abyssinia, South Africa, and Madagascar, 3,000,000.

"American Big Game in its Haunts."

Commenting on the new volume of the Boone and Crockett Club's book, the New York Evening Post says: "President Roosevelt contributes the first chapter, which is on 'Wilderness Reserves,' and tells of his visit a year ago to Yellowstone and Yosemite Parks, and the Grand Cañon of the Colorado. He writes of the abundance of game in the Yellowstone, their apparent indifference to human beings. The President is certainly enough of a huntsman to know whereof he speaks. His description of the beauties of the Yosemite and his final appeal: 'There can be nothing in the world more beautiful than the Yosemite, its groves of giant sequoias and redwoods, the Cañon of the Colorado, the three Teton; and the representatives of the people should see to it that they are preserved for the people forever, with their majestic beauty all unmarred—should not pass unheeded.'

Barking Squirrels.

PORTLAND, Indiana.—*Editor Forest and Stream:* Rifleman asks if your readers have "any knowledge of this matter." His inquiry has the ring of sincerity, and merits an answer in kind.

I have several times written of this section of the country, as to its native timber, etc., but I realize that as the years flit by new readers pick up *FOREST AND STREAM*, and the old story may well become a twice told tale and not suffer in the telling.

Fifty years ago eastern Indiana was a forest of oak, ash, hickory, and elm principally. Burr-oaks—some of them five feet in diameter and fifty feet to the first limb, with shellbark hickory, and elms were found on the black soil flats; white-oaks, red-oaks, hickories, ash, beech, and a variety of other timbers covered the clay upland.

Squirrels were abundant, for the hickories, oaks, beeches, buck-eyes, and lins furnished food, and from about 1862 to 1872 I shot more squirrels than any other boy in my neighborhood. I traded a watch for an Ideal squirrel rifle. My father's deer rifle carried too much lead to suit me. The muzzle of my gun came to a level with my shoulder when loading, and my height was about 5 feet 9 inches. It was full stocked and the molds ran, I think, 80 balls to the pound. While it was my custom to shoot at the side of a squirrel's head, I did, on occasion, shoot them through the body. These were usually old squirrels that thought themselves hidden when they could not see me.

Many and many a time have I drawn a fine bead on the upper edge of the limb directly under a squirrel's throat, and at the crack of my rifle the squirrel would be thrown a foot or more above the limb and fall to the earth dead, while a barkless white spot on the limb showed where the ball struck. This could not be done when the limb was either too large or too small. If too large, the ball glanced upward into the squirrel; and I found it a good plan, when shooting at long range at a squirrel on a large limb, or on the trunk of a tree, to aim between the squirrel and the tree, providing the animal lay close to the tree. When the limb was too small, the rifle ball might shatter the limb and the force of the explosion go downward and not jar the squirrel enough to injure it. The barked squirrels that I examined had a lump in the throat, but I never took the trouble when dressing them to diagnose the immediate cause of death. G. W. CUNNINGHAM.

Editor Forest and Stream:

I am the "anonymous" villain who stirred up your correspondent Rifleman, by nefariously trying to bust his trust in the Daniel Boone legend. Your correspondent seems to have fine scorn for anonymous writers, and therefore it may be presumed that Rifleman is his full and proper name.

My anonymity was accidental. The article on "Squirrel Barking" in the Evening Post was signed with my full name, but the signature was dropped by accident in the make-up. Shooting and Fishing reprinted the article over my signature, giving credit, however, to the wrong journal.

Rifleman's personal sarcasms are not relevant to the main question, and I need not waste space in emulation of his style of controversy. It amuses or pleases him, no doubt, to regard me as a very ignorant person, and it does not hurt me. But when he intimates that I invented my account of the shooting of a squirrel with several .44 bullets—revolver, not rifle, by the way—I must assure him seriously that he is in error. The facts are precisely as I stated them.

My purpose, as any attentive reader would have seen, was not to discredit the marksmanship of Daniel Boone. There is no reason to doubt that Boone could drive a nail, snuff a candle, or knock the bark from under a squirrel with a bullet. But I doubt that the shock given by the bark knocked off by a bullet is sufficient to kill a squirrel, and I give the results of actual tests to justify my doubt.

I accept Audubon as authority on the color, form, and habits of birds, but I do not feel bound to accept all that he wrote as gospel truth. Perhaps he romanced a little, like some naturalists of these days. I reserve the privilege of taking a liberal portion of salt with his tale of the man who was lost in the Everglades, for instance. It is true that the magazine writer who used Audubon's description of Boone's shooting did not name the writer, and that I failed to recognize it, not being able to carry all that I ever read in my head, ready for instant use.

As quoted in the magazine, the story goes further than the account given in the "Life of Audubon." In the Life the feat of barking a squirrel is explained as "hitting the bark close to a squirrel's hiding place, to drive him into view," or words to that effect. According to that version, Audubon saw one squirrel killed by the shock. The magazine writer has Boone keep up the firing for several hours, and procure "as many squirrels as he wished."

Of course Rifleman may believe anything he chooses to. I would not, if I could, deprive him of the consolation of faith in all the fairy tales written about shooting. But I have heard many men tell of seeing things done which never were done, and I am unable to believe all the stories.

A very popular writer and lecturer on animals relates as of personal experience and observation many remarkable things concerning wolves, deer, bears, foxes, dogs, rabbits, and birds, and the world is full of Rifleman who believe that the eminent naturalist has seen all that he describes. I don't. In fact, I know absolutely the contrary, for I told him some of the stories which he has adopted as his own, and I know where he got others. They are good stories, and they sound better told in his way. It is a privilege of literary art to confiscate good stuff and give it an air of verisimilitude by making it a part of the author's own experience. That is, so it appears.

There is a queer kink in the Audubon-Boone business which the editor of *FOREST AND STREAM*—or perhaps Rifleman, who appears to have the books handy—may be able to straighten. I have only the "Life of Audubon" at hand, and that is hopeless in the matter of dates. Daniel Boone emigrated from Kentucky to Missouri in 1795, when Audubon was yet a schoolboy in France. The "Life" seems to put Audubon in Kentucky somewhere between 1812 and 1820, when Boone was anywhere from 77 to 85 years of age and a resident of Missouri. How, then, did Audubon "make frequent hunting trips" with Boone in Kentucky, and how did he have his "first interview with Boone" near Frankfort? Boone died in 1820 at the age of 85, in Missouri. Was his eyesight unimpaired up to the day of his death?

After untangling the Boone dates, I would be pleased to hear from Rifleman on other points of my myth-busting screed. Does he believe that Morgan's men, running, could hit squirrels at 300 yards, as Professor John Fiske, another great writer, solemnly avers? Does he insist on the absolute veracity of eminent writers on South Africa, who say they have repeatedly seen mounted Boers kill running antelope at 1,000 yards? What does he think of Natty Bumppo's feat of tossing two potatoes in the air and putting one bullet through both? How about shooting at an ax-blade in front and cutting off the head of a chicken behind with the rebounding bullet? Does Rifleman know by experience what angle a lead bullet takes in the rebound from a smooth steel surface?

I am not quite so skeptical as the man who said: "I believe mighty little that I see, and nothing that I hear," but I don't take rifle stories or hunting yarns wholly on faith.

ALLEN KELLY,
Ex-Captain California Sharpshooters.

NEW YORK.

McCONNELLSVILLE, Pa., July 15.—I wish to express my appreciation of last week's copy of *FOREST AND STREAM*. I think it the best copy for a long time. I was glad, indeed, to see the genial face of L. F. Brown, whose "Musings" I have missed of late, but hope he will continue to muse, and let the readers of *FOREST AND STREAM* hear from him.

Rifleman hit the spot in his article on "Squirrel Barkers and Myth Busters." If the aforementioned myth buster can be found, and still does not believe in squirrel barking, let him take a trip down here into the wilds of Fulton county, and I will agree to find him plenty of natives to do the trick to his entire satisfaction.

LESLIE W. SEYLAIR.

Quail in a San Francisco Park.

NEVER did pictured assassination of Cock Robin create more horror in any nursery than was occasioned in Police Judge Conlan's courtroom when the stiffened carcass of a quail was passed up yesterday to the bench for inspection and then registered as Exhibit A in the case of Joseph Ferrari, charged with wilfully slaughtering the bird in Golden Gate Park. His Honor and all other true sportsmen present shuddered as they viewed the corpse and listened to the testimony for the prosecution.

It was Policeman J. H. Kavanaugh who pressed the charge. While patrolling the park he chanced to glance adown the bosky dell, and there he saw the defendant deliberately wring the neck of the feathered treasure and then thrust it into his coat pocket. To arrest him was the work of a moment, and to haul him to prison consumed no more time than was absolutely unavoidable.

Ferrari, who is a produce dealer, pleaded that he was acting a Samaritan part, instead of that of a cold-blooded poacher, when the patrolman collared him. A large dog of unknown ownership had chased and captured the bird, Ferrari said, and was proceeding to pluck the feathers from it when he (Ferrari) went to the rescue and drove away the quadruped, took the captive, then feebly panting, in his hands and had put it in his pocket to restore its breath, when the hand of the law fell heavily upon his shoulder. He denied the neck-wrangling.

Sharp questioning from the bench shook up Mr. Ferrari's defense until it was a very rickety structure, indeed, and as he was pronounced guilty as charged and promptly fined \$100, satisfaction was reflected on every face in the chamber except his own.

"To kill quail out of season is reprehensible, even when they are running wild," quoth the judge, "but to slaughter the birds that are preserved in Golden Gate Park is vandalism as well."

Clerk "Jack" Rice was overheard remarking to Bailiff

Laws that while he had not much use for British institutions as a whole, he thought that the anti-poaching statutes of that effete nation might be copied into the California Criminal Code without disfiguring it.

Mr. Ferrari got nothing but humiliation in return for the \$100 he paid into court. Possession of the remains of his victim was denied him, so he cannot have even the poor satisfaction of subjecting them to taxidermic art and preserving them as a souvenir of the most indiscreet act of his life.—San Francisco Call, July 1.

Game About Fort Yellowstone.

TRAVEL in the Yellowstone Park has begun again, and promises to be heavy this year. Visitors to that beautiful region will probably see more game than in previous years, for the animals that have spent the winter and spring about Fort Yellowstone seem loath to wander away into the high mountains, as is usually their custom, and about the 20th of June three mountain sheep were seen close to the road between the Mammoth Hot Springs and Gardiner. This is very unusual for the time of the year, but owing to the fact that more and more care is constantly being exercised to prevent the general grazing of stock on the reservation, there is now good grass where for a number of years there has been little or none. If the game is undisturbed and has abundant food it may very well remain on the lower lands until the flies drive it up to the peaks.

The domestic buffalo herd near Fort Yellowstone is flourishing wonderfully, and the total number of animals is now thirty-nine; eleven calves have been born this spring, and one wild calf—a female—captured, so that the increase in calves is twelve, with a possibility of two or three more. In other words, in two years Major Pitcher's herd has almost doubled in numbers. This is extremely encouraging, and is the best possible testimonial to the wisdom and judgment with which the herd has been handled.

This domestic herd was not started a moment too soon, for there is little prospect of any increase in the wild herd. They have hidden themselves in a section which is quite unsuited to them, and within the year at least six have perished from starvation. Last winter the snowfall on their range near Pelican Creek was very deep, and a stack of hay which Major Pitcher had put up for them was covered so completely that it could not be located even by the Government scouts when they went in to try to capture wild calves.

Rensselaer County Club.

WEST SAND LAKE, N. Y., July 4.—*Editor Forest and Stream:* The annual report of the Rensselaer County Rod and Gun Club shows a continuation of the good work undertaken by the members, and so efficiently and successfully carried out by the officers and the general committees. President J. R. McLaren writes in their annual report:

At the request of the Legislative Committee, Senator Barnes introduced a bill prohibiting the sale of trout caught in the streams of Rensselaer county, which was passed in the Senate, introduced and passed in the Assembly by Assemblyman Stevens, and was signed and made a law by the Governor, April 13, 1904. The uniform fall shooting laws passed by previous Legislatures have given good satisfaction, and it is conceded by competent authorities that no county of the State has better laws for the protection of fish and game than our own.

It is known that deer have increased in number during the last year.

Last September and October, at a considerable expense, efforts were made to prevent the illegal snaring and selling of partridge, and through the efforts of Protector Ferguson and members of the club, three convictions were made and fines collected, aggregating \$187.45.

Fourteen shipments of fish were received and planted, as follows: Rainbow trout, 5,000 fingerlings; brown trout 5,000 fingerlings, 1,000 yearlings; brook trout, 5,000 fingerlings, 1,000 yearlings; lake trout, 5,000 fingerlings, 2,000 yearlings.

At the request of the club the town boards of the following towns have requested the Forest, Fish and Game Commission to close the following streams, which have been stocked with trout: Schodack, branch of Moordenerkill, Poestenkill Fly Creek, Sand Lake, Geirhardt and Uline or Bowman brooks. The request has been granted and the streams closed for a term of years from May 1, 1904.

A goodly number of large rainbow and brown trout have been caught the past spring, showing that these varieties are adapted to our waters. Eight Mongolian pheasants were received in April.

The secretary's report shows that regular meetings have been held on the first Tuesday of each month. Forty-eight new members have been added. The receipts aggregated \$104.50; disbursements \$12.40; balance in the treasury June 1, \$32.40.

A close season was, at the request of our club, made on deer in our county by the Legislature of 1903 for five years. Within the last week it has been brought to my notice that deer have been seen in thickly settled farming communities in several different localities in the county.

J. R. McLAREN, President.

All communications for FOREST AND STREAM must be directed to Forest and Stream Pub. Co., New York, to receive attention. We have no other office.

Days on the Gunnison.

"Tis sweet to love,
But, oh, how bitter
To love a girl
And then not git 'er."

MEN love often and recover from their amatory lacerations; but show me the man who has hung, and played, and lost a ten-pound trout, and I will wager my last pound of Colorado radium against a bunch of rusty horse-nails that secret melancholy will prey upon his damask cheek till the Great White Horse gallops off with him into the untried regions of the Illimitable Unknown. I have suffered thus; I have felt the feel of the lusty beauty at the other end of the silken snare; have trembled with ill-concealed emotion as I fought to turn my headstrong quarry in his fierce floundering amid the foamy waters of the noble Gunnison; I have sat in my great weakness upon a friendly smoothworn stone and wept salty tears as I reeled my cast in to find that my carefully tested O'Shaughnessy was become straight as a hairpin. I have buttonholed sympathetic friends and told them circumstantially "just how it happened," and I have been grievously pained to see a look of incredulity play upon their features, for few, even in this region, where big fishes are the rule, care to swallow a ten-pound trout on one man's estimate. I regret to say that I had no opportunity to weigh him.

I played such a monster last summer—rather should I say he played me. And, if my readers will pardon the digression, I would like to ask if they do not recall at some time in their fishing career having encountered a saucy fellow who simply got caught just because he was too full of daring. There is a legend along the banks of the Gunnison that when a tenderfoot catches a big one it is simply due to the "won't-take-a-dare" spirit of the graceful, well-fed fellows who lay wagers and take turns at seeing who can come closest to taking the bait off without getting pricked. I personally believe this to be the case. You have seen small boys in skating time try who will do the most daring stunts on the thin ice, have you not? Guess I did my share of reckless stunts in youth; it was more good luck than anything else that saved me from a watery grave. Same way with the big, overgrown lunkers that inhabit the deep waters of the Gunnison. They are never hungry; they get their bellies too easily. But they are so full of life, and their lives are so full of excitement, that the things which round out the joy of ordinary trouts become stale and flat to them. Born dare-devils, afraid of nothing; the very appearance of danger arouses them to action. Cast in a dozen of the most tempting unhooked minnows and they are spurned with contempt. But just you draw a well concealed hook within thirty feet of the lair of a big lord of the deep pools and he takes it as a stricture upon his personal courage as well as skill in skinning hooks. It's foolish, this daring, but it is very like the foolishness of his air-breathing brother who stakes his all, his life as well, on a single throw of the dice. Once an Indian prince, becoming attached to a brave man of the mountain tribes, offered him a large estate, many golden pieces and slaves to do his bidding if he would only promise to come and live in the city and dwell in peace. "But, master," said the wild man, "I may go and seek the tiger in his lair sometimes?" "No," said this great lord, "I love you; I want you to live to be old and die in peace." "Nay, lord," said this man of the forest, "peace and gold and slaves are well, but I love excitement better, even though some day a tiger shall smash my head and suck my blood," and he returned to his cave in the mountains. Thus it seems to me do the Gunnison trout reckon.

I lost my trout last summer; lost him after seeing the iridescent flash of his silvery belly in the falling twilight; lost him after feeling the fullness of his great strength in mad rushes to escape; lost him after I had exultantly exclaimed to myself, "He is mine, mine, mine!" lost him because I had never before angled for fish that "took to the tall grass." I have angled some and fished a good deal in most accessible parts of the United States and Canada; killed big striped bass with trout tackle; brought ferocious bluefish to gaff with four-ounce rod after a fight of thirty minutes; had come to think myself anything but a tenderfoot.

But when my Gunnison friend left the stream and started up the steep banks of the river due north, covering six feet at a bound, I lost my grip on things and my dream was shattered.

The desire of my life had been to try the big waters of the Gunnison. Last August the opportunity came. The latter part of September is best for angling in the Gunnison; then the waters are at about their lowest; they are clear as crystal and the temperature is not above 60 degrees. October is also an excellent period, and Judge J. M. McDougal, who has a personal acquaintance with every big pool within miles of Gunnison, continues the sport away into November. Only one road leads to Gunnison—the Rio Grande; it takes somewhat better than a night to cover the distance

from Denver. Upon the advice of a friend in Gunnison I hired me a room and arranged to take my meals at one of the several really good restaurants in the town. The early bird catches the worm; the early angler the trout, and he who endeavors to breakfast at a hotel always arrives on the fishing ground too late for the cream of angling. And a true angler so likes to linger into the shadows that blend the dusk with darkness that he is like as not to return to his hotel just in time to either get nothing at all or to find everything soggy and cold. That, at any rate, is the run of things in Colorado. Gunnison cooks excel in the preparation of early trout breakfasts and late ditto suppers; never did one of them demur, even when I dragged myself off my wheel, wet, and cold, and hungry, away after Old Sol had tucked his auburn head under the impossible gray-and-red hills of the occident.

Furthermore and also, the best sport commences after twilight and continues long beyond the hour when one may lawfully cast his flies or draw his minnows. I think I may safely say that it is useless to spend time casting flies until the rays of the sun have grown far aslant and beam more with red than gold.

But about the big fellow I lost. It was in a deep pool just below a pretty wooden bridge. Heavy teams had crossed and recrossed till the impudent fellows had grown not to mind at all. At infrequent intervals one could see a whopping big one emerge from the shades of the dark pool, turn his fat side so as to reflect for an instant the rays of the sun, and then glide back into the darkness of the silent waters. But stand and cast ever so long, ever so carefully, one was never rewarded by a single rise. There were half dozen of them; I came to know them well. Exclusive, they were, swimming deep down whenever seen. The smaller fry, of which there are myriads, seemed to sport nearer the surface. I soon exhausted both fly book and patience. I got down on my belly and crawled to the bank from a distance of a hundred yards, and cast so that not even the shadow of my tip should fall upon the water. Truly, they were a foxy bunch; versed most deeply in the arts of the angler; immune, I called them, along with other adjectives not so polite. There they were—five, seven and ten-pounders—big of girth and strong of loin, each in his own particular lair, headed up stream and ready to snap up the smallest fly, or bug, or worm that the friendly waters swept athwart their domicile.

I quickly exhausted all my fish lore and thought with bitterness of the remark of a native who ventured the information that "you won't catch nawthin' in a hen's aige if you wear them dude clothes," the dude clothes aforesaid being a duck coat that has seen service, lo, these fifteen years, duck breeches that have forgotten all the legends of their youth, a battered homespun cap whose pristine colors have long since departed, and a pair of mountain boots—distinctly new. I love my old fishing togs and would not part from them for twice their value in new ones. They become sacred the older they grow. The difficulty with the shoes was their predecessors had simply "cashed in," making new ones a necessity. Old clothes and old shoes, like old and tried friends, are too valuable to be discarded for the new and untried.

My vacation was to be a week, and already three days were gone. Anglers all about me were taking thirty and fifty small fry daily on the fly. I might have done so myself, but I was after a "big one." One whose pelt I could stuff and hang up in my den and begin my story with: "That? Oh! that was one I caught down Gunnison way in the summer of 1903," and so on. So this afternoon I caught me two big grasshoppers—dandies, they were, and led me a chase—and allowed one of them to float unannexed down the pool. There was a rush, a swirl, the waters opened and la cigale disappeared. The second, I attached to the most invisible of leaders. He was big, very strong, and made desperate efforts to recover the land. Certainly his struggles must have exasperated my friends, watching him from below, but they were "cagy." Not a rise. A shot took him to the bottom; same luck. Finally he stiffened and died of suffocation. Truly, I was up against the real thing.

"Say, my friend, ye hev no mo' chanst to hook one o' them 'ere old hunkers then I has ter walk a tight rope."

My accoster was so much the worse for libations that it was even difficult for him to keep on the bridge. He was not an equilibrist; that was plain. Night was coming on, I was "cussin' mad" and full of disappointment. Carefully attaching a splendid royal-coachman to a nine-foot salmon leader, I determined to cast that pool till the water was hot with friction. I doubt if I ever cast so faultlessly; my fly came floating down through the air like a snow drop; not a particle of drag; and the moonlight added a beauty to the scene that was both mystical and charming. I recovered my good temper—replaced it with determination. The jagged comb of the distant peaks were silhouetted against the red-flecked sky, the busy mosquitoes were out in numbers, and my friend, the lame engineer up on the bridge, was indulging in sarcasm at my expense.

"Cut it out; let's go home," he adjured.

"One more cast," said I, discouraged.

It was faultless; away floated the bunch of feathers and barb; fifty feet away it settled on the water like a snow drop. That is why I prefer a lance rod; one can not cast as far, but the delivery is much better. I had drawn the fly almost its limit. (Reader, dear, do not question my veracity: some things are indelible; coming face to face with death is one, face to face with a ten-pounder is another), then the waters broke into a white foam. There was no warning. It was like the bursting of an unannounced hurricane. My lancewood bent and doubled like a willow switch; something leapt three or four feet into the air and broke for the depths of the pool.

"Oh, lord, he's a big one!" exclaimed my lame engineer in his excitement, shoving the hot bowl of his pipe into his mouth. He stood on the bridge and stumped his wooden leg excitedly, meanwhile shouting directions and encouragement to me.

I am up to my neck in business; too busy to talk; just set my teeth and watch my wand curve as it has curved never before. I remember I am proud of its action; remember that a thousand thoughts flash through my head instantaneously; elation is the regnant feeling; also confidence. No fear of my tackle; there is none better, that I knew. My one concern is, "Is that hook well set? Will it hold?" That is the burden of my prayer. Another lunge by my frantic friend, and I conclude that only by exercise of utmost care shall we become closer, if not better, friends. Here he goes up stream, tugging like a vicious bull, literally trying to smash the whole tackle. Such strength, such determination, such magnificent rushes! 'Tis like nothing I have ever tackled before. I have seen bucking bronchos—seen them "weave," and "sunfish," and throw somersaults, lie down on their riders, even try to chew them up with sharp teeth, but the fighting of a broncho "outlaw" is as an evening zephyr contrasted with the quick, fierce action of a Gunnison steelhead. My quarry's turns are so sudden, so unexpected, that I can think of no contrast.

Up the swift stream he rushes, my silken line cutting white lightning-like zigzags on the black waters. No use trying to turn him. I find myself wondering if he intends taking the whole line; he suddenly concludes he has gone far enough and doubles, coming down stream like a cannon ball. My quadruplex responds gleefully, beautifully. He fails to get a foot of slack. My heart sings a song of joy. Enraged at his impotence the big fellow darts a full four feet into the fading sunset, scattering a miniature shower of opalescent pearls over the black pool. On striking the surface he again darts away, tugging like a young ox. My drag makes a noise like the song of a summer locust. Now he has headed down stream, down among the big boulders that stick up frightfully high and jagged-like, and I, in my vanity, try to turn him. But the whirling spool burns my thumb, which I use for a brake. I do not heed the pain till long afterward. I must, I will stop him, I mutter subconsciously. My willowy wand bends nearly double. I give up, I look for the crash, when lo! my friend turns back and comes charging toward me like a fiend possessed. He leaps a clean three feet from his element, and describes a perfect parabola in the glowing sun-tints. I am bewildered at his staying power, astonished at his fierce resistance.

There is never a sparring for time, no taking of measures, no sulking at the bottom—only action, and more action. Never have I seen such wild rushes, such terrific, smashing work—crowded into so short a space of time. Not a moment of supineness—all brilliant battling. Twice does he journey to the head of the pool; twice do I turn him. His efforts to reach the dangerous rocky ground at the lower end are no more successful.

I begin to feel the thrill of the conqueror, to think my noble quarry is marked for my own, that soon I shall be reeling him inshore. I mentally select a convenient beaching place and begin to work my way toward it—inch at a time. Surely he must be exhausted with all this masterful battling. I feel easy at last, and say things to my pretty rod. Now I lead my handsome catch toward me—slowly. 'Tis nearly dark; I cannot see even his outline in the water, but he is large and oh! so heavy. He comes—unwillingly, it is true—but he comes, fighting stubbornly for each inch lost. He is spent, finished, conquered—not another leap left in him.

"Bully," yells my friend on the bridge, preparing to join me. "You have him now; reel in. I'll help you."

I look up, my attention is distracted, I hesitate for a moment, I relax a single pound of pressure on my butt; there is a rush, a whirling sound, as of quail taking to wing, and my captive shoots straight up the almost perpendicular bank, fully six feet from the water's edge. As he rolls back into his native element, something causes me to realize that he has won—not I. That one unguarded moment has cost me the biggest and best catch of my life.

Listlessly I reel in, down upon a big stone I sink, and am thankful that the darkness covers the tears coursing unbidden down my cheeks. My heart flutters, I am spent with excitement. He of the wooden leg says words intended to be consolatory. But they console not.

The remainder of my stay is uneventful. I get my share of small fry, and my Denver friends are well provided for. But never another strike from a "big one."

When I returned from Gunnison this fall I shall dangle the scalp of one of those old lunkers from my belt or know the reason why. I have been studying the Gunnison "rainbows," and the more I study them the more I am convinced they are not rainbow trout. Judge McDougal, who has given the matter much study, says they are nothing more nor less than *Salmo irideus*, steelhead salmon of the Shasta in California. Without going into the merits of the case, which would spin this paper out entirely too much, allow me to say, that I have killed several rainbows since coming to Colorado (one a seven-pounder in the North Platte, where they are reputed to be great fighters), and the difference between a Gunnison rainbow and the other kind is the same difference one would expect between a gentle coach dog and a full blood bulldog. I would respectfully refer those seeking technical information on this subject to Judge McDougal, of Gunnison. The latter says that long before rainbows, which are rather sluggish fighters, were introduced into the waters of the State the Gunnison teemed with these ferocious fellows. Then they all suddenly disappeared from causes never explained, reappearing later and quite as inexplicably.

Comparing the rainbow with the native of the Mongaup or the Neversink, in Sullivan County, N. Y., is an affront to the latter. There is more steam and ginger in a one-and-a-half pounder taken from the latter streams than in a four or six-pounder of the rainbow variety. The native Coloradoan, or mountain trout, is a game little fellow; he fights viciously; the Gunnison teems with millions of these, and they rise to fly quite readily. One may fill his creel to the legal limit any afternoon.

But it is of the Shasta trout or steelhead that I write. The natives will tell you they prefer live bait. Many strangers try for them with fly, but truth to tell, very few are taken in that manner.

"You just throw away your time with flies," said one of the oldest and best guides in the town. "Some of the best anglers here will tell you they take their big ones with fly; it is absolutely untrue in nine cases out of ten. Occasionally I have taken a big fish with fly. But it was when angling for small fry, and the thing occurs so infrequently that it may be called an accident. The fly is all right for two and three-pounders—but when you get into the heavyweight class you want live bait, good tackle and a knowledge of what to do when you get an engagement. I am not surprised at your losing your big one—guess he'd have played the same trick on me, too. But come back next September, bring a pair of wading breeches, a good minnow tackle, and you shall have the greatest sport in the world. Personally I, too, prefer fly-casting, but if you want the heavyweights, you must use the lure they will take. If you want to be dead swell and get no run for your money, use flies." This man confesses to having killed eight or ten trout in a single day's work that would fill a sugar sack and tip the scales at eighty or ninety pounds. Dividing his catch among a number of wealthy clients, the latter manufactured pleasant little stories to take back home with the stuffed skin. Dead fish tell no tales.

If you are going to fish the Gunnison, brother angler, your reel should hold forty yards of the best enamel line; it should be capable of very rapid work, because these fish are quick fighters, probably the quickest and trickiest on earth. Most Coloradoans advocate a bamboo rod of eight or ten ounces and ten feet long. On that point I differ, though nearly every angler tells me that anything but bamboo will perish quickly, on account of our dry climate. Doubtless most cheap woods do soon perish here, but I have a willow affair of selected DiGama and lancewood that is as good to-day as when it was first made. It has stood the test of four years of Colorado climate, and is still perfect. It is a Mitchell, a most beautiful creation, weighs less than five ounces, and is six inches short of ten feet.

Your leader should be of a strength equal to the best Bangor salmon, mist colored. Much depends on the care with which the leader is prepared. Join two such three-foot leaders in the center with a swivel. Attach your leader to the line with another swivel. Avoid anything cheap. To save thirty cents you may lose a ten-pound Jim Jeffries of the Gunnison. You will require leaden shots of varying weight, according to the velocity of the water in which you are casting, to carry your bait beneath the surface. The shot should be placed just above the middle swivel. This arrangement allows the minnow to twist around or whirl in the water when trolled; the swivel prevents kinking or snarling.

Don't try to economize on hooks; use an O'Shaughnessy, a Pennell or a Sproat. No. 00 prove most satisfactory. In baiting it is absolutely essential that no part of the hook shall show outside the minnow, therefore, the shank should be not more than half an inch long above the bend.

You may wish to try the fly; these should be mounted on No. 2 hooks, same as above named. A dozen each of plain coachman, with junglecock wings; gray-hackle, with peacock body; gray-hackle, with cream yellow body; dusty-miller, silver-doctor, Alexandria, will be sufficient. The best are none too good or strong. During some parts of the day the fly may be the killer; experience will decide this.

Such men as Judge McDougal, Mrs. McDougal—who was high line last summer, with an eleven-pounder to her credit—and Guide Thompson, only cover two or three pools in a day's fishing. "Pick out a good pool and stay by it till you have learned what the fish will take," is a good motto. You will find at the bottom of one pool a covering of small, smooth and nearly round boulders, well polished. Such pools are the best,

Somewhere through the length of all pools a narrow, deep channel extends. In this trough lie the large ones, watching many yards up stream for their prey. This channel is usually some distance below the head of the pool where the current flows swiftly. One must wade frequently till the water takes him under the armpits before reaching the "striking point," which is usually at the head of the trough. Again, one must frequently plant himself in very swift water at the head of the pool, where few but heavy-weights can hold their footing. But it is absolutely essential that one place himself in position to make a faultless cast of from 35 to 45 feet, easily covering the striking point. Make as little display of waving arms as possible. Cast as far distant as you can, and after each cast move a short step into new ground. It is waste of time to repeat faultless casts over the same spot. These wary fellows, lying in the deepest waters, make long runs of many feet to strike, returning at once to their lairs when hooked. They will not strike fly or minnow at their quarters. The gaudiest fly passed in the most faultless manner before one of these old stagers will not tempt him. Rub his nose with the swellest minnow, and he will treat it with contempt. These trout are well fed—never hungry. They are daring, dashing, full of sport, seemingly bent on outwitting each other in athletic prowess. They seldom come near the surface, even when enticed with natural flies or minnows thrown upon the water. But begin to cast, and you need not be surprised to see one jump three feet out of the water, and twice or thrice that distance across it. Many believe it is the love of sport alone that leads them to strike. For myself, I am convinced they make wagers among themselves to see who will do the most reckless stunts, knowing full well that inside each live bait there lurks a barbed hook, which may mean death to him who fails to "make good" and take the bait off.

Having encased yourself in wading breeches and taken an advantageous position up stream you feel your way carefully by faultlessly casting over every foot of the approach. If you make a kill, do not fail to start at the beginning and go all over again.

The ideal minnow is four inches long, two inches in girth, and is far best if "bleached." An old sock half filled with ice will "bleach" them in a few hours—make them look discolored and spotted. Run the hook down the mouth into the maw, bringing the point out through the thick part of the minnow's back in front of the dorsal fin. Hooked thus the minnow will stand out straight when thrown into the water and the shank of the hook is completely hidden. In case large minnows are not to be had, two, or even three, small ones may be used instead, putting the first on as directed and sliding it up the snell. Bring the hook out through the back of the last, slip the first down and run the hook through it. Often a big fellow will take the bunch thus made up more avidly than he would a single minnow. Kinder seems to think it is a new game for his special delectation. But sometimes he seems to divine the trick, and the way he shaves those little minnows off without touching the hook would lead one to suppose he carried a safety "razzer" in his vest pocket. If he does this twice, don't be discouraged, don't swear, but change your tactics. Hook the first and second minnow on just as before. Now take a very small minnow and string it on the hook just as you would an angleworm. Be sure to conceal the point of the hook completely within the tail, and slip the others down. Now try again. If he proves adept at this style of grafting be of good cheer, and think what an old "lunker" he will prove to be when he finally flops on the sand at your feet. Now, put on the largest minnow you have, take the eye of the last trout you have killed, imbed the point of the hook in it, slip the minnow down to the eye, and think of Bruce and the spider. Strike him good and hard—if you can—if you can't, recollect that a soft answer turneth away wrath.

Minnow-casting is a more difficult art than fly-casting. And after learning to cast scientifically, you must acquire the art of keeping your lure under the water close to the bottom. At times it is best to bring it to the surface, then drop it down again, but always void allowing it to hang on the boulders. Keep the minnow moving at the bottom with a dodging-like motion. Those who have fished for big small-mouth bass in the Shenandoah know what this means.

Long casts are necessary. In order to achieve them, retrieve your line in the left hand in loops of about two feet each. When you make your cast, the line will glide off your hand easily and rapidly, running through the guides smoothly. Cast the minnow with an underhand throw or pitch. If you are with a person who understands the art, watch him fifteen minutes, and then go in with the determination to do or die. You won't die. The cast should be made with little splash or injury to the minnow, and no alarm to the fish. Until this thing is well understood, minnow fishing is an expensive luxury. It is easy to throw away minnows unless they are properly cast. A half hour's experience is worth more than a month's book study. But any bright fellow can get the "hang of the thing" in a little while. After that practice is the only requisite. Its kinder like making love—awful hard the first time, but so easy when you know how.

Each time you cast let out a little more line, till you have reached the limit of your capacity to cast faultlessly. Above all things, avoid trying to cast your line directly off the reel by means of the weight of the minnow. Your reel is almost certain to overrun, and should a big one strike at this juncture—as often will happen—it will be crash and smash, and you will wonder how you came to "cash in" so soon. If you want to enjoy the sport and get all that is "coming to you," you should be able to lay your minnow on the water with precision and silence at least forty feet away. Some experts can even do better than this. Often it is unnecessary to cast your minnow—the current does the work after you launch the bait. This is where you can get directly up the stream and let your minnow drift down. By "sawing" the waters right and left you can readily cover the ground at least a hundred feet away. Some experts claim that they can kill a trout to a minnow on the average and lose no tackle during an entire season, save when the reel has fouled the line or the line has become looped, preventing passage through the guides.

Always keep four or five feet of slack line in the left hand, and when you get a strike, give your victim this slack in a hurry. Your rod should be kept at almost perpendicular up to the point of a strike, but the moment you receive telegraphic notice that there is "something doing," drop your rod from perpendicular to horizontal, thus making no resistance. This is the critical point. Your friend in the water makes a rush for his lair, throwing open the vent at the gills and causing the water to carry the minnow down to the swallowing point. If you let him have his own way just at this juncture, he will swallow both bait and hook. It is important that you make no resistance at this point. After he has swallowed, all you have to do is to "set" your hook well in the maw and then keep a clear head. Once a big one is well hooked, it takes very little experience to make an easy landing. Keep the rod at the butt almost perpendicular at all times; don't allow it to lean either backward or forward. Should you be compelled to make a horizontal pull at times, keep your butt at right angles to the fish. Whenever he becomes quiet for a moment, just you hold steady, and all the time keep your eye on the spot you have selected for beaching him. At every opportunity get a little nearer to this point, and when the time comes for decisive action, back away from the water fifteen or twenty feet. When you have him at the edge, lying on his side, do not relax. That would be fatal—to your hopes. Keep a tight line on him, and reel up as fast as you can. Walk nearer, and when he begins another of his struggles for life your taut line will cause him to "walk out on dry land just like he had feet." A landing net is a distinct disadvantage—often causes loss. Under no circumstances try to land your fish by taking hold of the line. Your hand offers so much resistance that he easily tears the hook out and escapes. But a flexible rod offers only sufficient resistance to keep the hook well set and prevent your catch from returning to his native element.

Do not hug the delusion that you will have a fight of half an hour when you hook a big one. It will most likely be a fight of five to ten minutes, but it will seem like a certain benedict's description of married life—a very long period. "Huh!" says someone, "six minutes!" Yes, and it will be the liveliest six minutes since you had that heart-to-heart interview with dad and a barrel hoop in the basement. It isn't a really long time, but it seems so, you know. When two real fire-eating athletes go at each other hammer-and-tongs, it is a good fight, but inevitably they are "all in" in short order. So, too, with the king of the Gunnison waters. Either he is yours inside of ten minutes or you are his'n.

A word about the selection of pools. A beautiful Indian maiden in quest of a husband was once told that she might walk through a cornfield and select an ear of maize. According as she selected the corn would her husband be worthy or unworthy. Well, she passed carloads of full, ripe ears, and finally selected a little, worm-eaten nubbin that a Rocky Mountain jackass would have elevated his upper lip over. So of the man who tries to cover too much ground in a day. Select a nice inviting pool and give the inhabitants all you have in the way of inducements to do business, till you get them interested. Sooner or later you will find what they want. Then give it to them. You may spend an hour before you get a strike. Devote your entire time to three or four pools. There are more old timers in either of them than you will take in a year. They will respond about as well in one pool as in another; the difficulty you will find is in getting acquainted. Kinder pet 'em, rub your bait across their noses, and shave their whiskers with your leader. They don't care for strangers—particularly tenderfeet—but once get 'em coming your way and they will furnish you the sport of your life. Once you persuade one to try conclusions with you, it's a sure thing others will follow.

In conclusion let me admonish you that if you have struck your quarry in the lower jaw he will run off to some spot and at the bottom will shake violently and rub against the stones; if in the nose, he will make some violent breaks out in rough water, but will come to shore soon and easily; if in the roof of the mouth, he will go skywards, and lunge and pitch, roll on top of the water, and cut all other antics imaginable, finally breaking the hook off at the barb, most likely; if through or behind the lobe in the corner of the mouth, he will give you the hardest fight of your life, and stay a long way off from you longer than if you had struck him in any other place; when you think he is coming ashore all right he will cast his weather eye at you and go for deep water again and again; but be patient, as you are sure of your hold, and he will submit after a while. With a little experience one can tell in a few seconds after the strike just where the hook is planted, with the exception that it takes longer to determine in bait-fishing whether you have him in the corner of the mouth or down in the maw. He will give up much sooner in the latter event.

DILWORTH CHOATE.

Miss Sullivan's Big Fish.

THE Buffalo Evening News of July 12 reports that Mr. W. P. Dawson sends us the paper: A half hour's battle between a frail young girl and a monster maskinongé was witnessed by at least a score of people yesterday afternoon on the Niagara River off the foot of Ontario Street. Nineteen-year-old Lillian Sullivan and William Goss, an old-time river man, were trolling for maskinongé in about the middle of the Niagara, between Mutz Bros' boat house and the head of Strawberry Island. Miss Sullivan said, "Stop rowing, Bill, I'm snagged," and a second later cried: "Pull, Bill, pull! I'm not snagged; I have got a strike!"

"Oh, quit your fooling," said Bill, "and let out some line or you'll be pulled overboard."

"No, no," said Miss Sullivan, "I'm not fooling. I tell you, Bill, I have got a strike!"

Bill looked at the girl. He saw by the way the line was running through her hands that she had a sure enough strike, and thought that she must have hooked a young whale. Bill always knows just what to do in an emergency. He rowed gently or strong as the occasion required. He realized that there was a big fish on Miss Sullivan's hook, and endeavored to guide the boat so the

strain on the line would be equal at all times. To give the line any slack would be taking chances of losing the fish; to pull too strong would break the line or pull Miss Sullivan overboard. But Bill knew his little book. After playing for perhaps ten minutes the maskinongé broke water. It was then seen that it was a monster fish.

Other boats gathered around and volunteered all kinds of advice. One man said, "Let me shoot him." Others, "Pull him on shore and beach him," and one man with a minnow net wanted to do the trick with that. But Bill was cool, and told everybody to keep away and give him a chance to play the fish to tire it out. This Bill knew from experience was the best way. When the 'longe broke water three or four times and didn't shake the hook from its mouth, Bill knew he had it hooked good and fast, and the only chance of its getting away was to break the line or pull Miss Sullivan overboard.

After the maskinongé had been played for about thirty minutes, it showed signs of quitting. On Bill's advice, Miss Sullivan began to pull the fish toward the boat so that Bill could gaff it. But, like all of its kin, it was game, and when near enough to see the boat, took a splurge, and was gone again with thirty or forty feet of the line. Unfortunately for the 'longe, Miss Sullivan's feet got tangled up in the line. Had it not been for Bill she would perhaps have gone overboard, so fierce was the fish's rush for liberty. But after this, his final struggle, Miss Sullivan, with the assistance of Bill, pulled the maskinongé close alongside and lifted it into the boat. It was the largest maskinongé of the season, weighing 47¾ pounds.

Fish Chat.

Gamy Pollock.

A YEAR or more ago I gave in FOREST AND STREAM an account of a day's sport. I once had among the pollock, which fish, twenty or thirty years since, were, and for aught I know, still are, abundant in the harbor of Eastport, Me., and thence out to Grand Manan.

That was my first experience with this gamy salt-water species, and the sport I had was, I considered, well worth recording, partly because the story might prove interesting to some of my brother anglers, but chiefly that it might serve as a reminder to those who are taking their outings at the seaside that there is a fish which is pretty abundant all along the Atlantic Coast, from Cape Cod to the Gulf of St. Lawrence, and which gives as good sport when handled with rod and reel as can be desired. The account that I then gave of the habits of the fish was so full, I will not dwell on them here, except in a general way.

Distribution of the Fish.

The distribution of the pollock is very wide, it being one of the most common species in European waters, as well as those of our Atlantic Coast, and it ranks second only to the cod in importance in the sea fisheries, or if not second it is a close third, the haddock outstripping it.

Merits of the Pollock.

While its economical value is well established, its merits as a game fish are not generally well known, but I find that anglers are becoming acquainted with them along our shores, particularly in Maine and Nova Scotia, in whose bays and estuaries the fish congregate in very great numbers.

I have recently had an opportunity to renew my acquaintance with the pollock, and I found it just as lively and full of fight as I remembered it as being thirty years ago. I was taking an outing at the quaint little town of Lockport, N. S., whose inhabitants depend for a livelihood almost entirely on the harvests they gather from the sea. Of course I soon became acquainted with all the anglers in the place—and by anglers I mean those who handle the rod and reel—and quickly learned that as the season for tidal or sea trout had passed, those fish having ascended the rivers where they will remain until their spawn is cast in the autumn, the sportsmen were depending largely on the pollock for recreation, and I was invited to join them as often as I desired.

That I gladly accepted their invitations goes without saying, and I found them to be capital fellows, and worthy disciples of good old Izaak Walton. The most sportsmanlike method of angling for pollock that was practiced was by casting the fly out into the surf from the rocky ledges which cover a long promontory south of the town, and bordering the inner harbor, the most successful fly being the red ibis.

Casting the Fly from Cliffs.

In casting the fly from those high standing places one needed to be constantly on the alert, for the breakers were always carrying the lure among the rock weeds which grew luxuriantly among the ledges. While one can put out a longer line from such high points, he cannot always put and move his fly as he would wish, and pollock angling is therefore, under such conditions, not an easy matter. It is practiced, however, all along the cliffs of Wales and Scotland, and Maine anglers are becoming versed in the method along the rocky shores of that State. As a rule, the pollock thus taken are not large, their average length not exceeding a foot, although occasionally good sized fish accept the fly, but on light tackle even these small fish give as exciting play in the heavy surges of the dashing breakers as would the most plucky sea trout.

One of my friends insists upon it that all salt-water fish give better sport, pound for pound, than do any of the fresh-water species, declaring, as an example, that an 8-pound Rangeley trout can easily be handled and landed with tackle that a bluefish or striped bass of similar weight would smash in a very short time. He is a gentleman of very great experience, and his assertion ought to carry weight.

The pollock taken from those cliffs never leaped above the surface of the water, but they often made long runs out into the surf, and rarely came to the landing net without a most determined and protracted struggle.

Pollock in Deeper Water.

I also found that no little sport was to be had in angling from a boat, the favorite locality being near the lighthouse at the entrance of the harbor. The boat was anchored in about four fathoms of water, and the hooks were baited with pieces of clam and herring, preferably the latter. The pollock were of good size and very gamy, and as they took the bait near the surface of the water, one did not have to stretch his imagination very much to fancy he was among some lively sea trout.

As I did not care very much for the bait fishing—it seemed much like pottering—I removed my bait hooks and substituted for them a short leader, to which were attached a red ibis and a silver-doctor fly, and with these I had quite exciting sport for an hour or two until the tide turned, when, as if by magic, the fish disappeared, and we were obliged to pull up anchor and return to the shore.

I wish someone would explain why it is that squeteague and other sea fishes bite more freely on the flood tide, and why they decline all lures after it has fairly begun to ebb.

Peculiarly Marked Trout.

A curious story comes to the New York Sun from its Lachine, P. I., correspondent concerning the identification of a number of trout by their markings. A brief summary of the story is as follows:

A handsome lot of trout which were lying in a pan of ice in an office window in Montreal excited the admiration of all lookers-on. Among these was an elderly gentleman, who, on carefully examining them, accused the owner of the fish of poaching them from his private property, one of several lakes he owned among the Laurentian hills, basing his charge upon the coloration of the trout. The accusation was indignantly denied by the angler, who declared that the fish were taken in another lake, and to prove his statement he brought a number of witnesses, who substantially corroborated all he said; but greatly to their surprise, the owner of the lake also brought his witnesses, who all asserted that the fish were taken from his water, among them being an inhabitant of the district in which the lake was situated, who unhesitatingly identified them by certain peculiar markings as having been taken from the lake in question. The matter was warmly discussed at considerably length, but was finally settled amicably.

Thirty-two Varieties of Trout.

The correspondent further states that during the discussion the owner of the lake boasted of being able to distinguish between thirty-two different kinds of trout taken from as many separate stretches of water, and that a gentleman from New York who was recently investigating the fishing in the Laurentides was much astonished when he was shown the great difference between the trout taken in several lakes, each lake seeming to have a special variety indigenous to it, and the fish therein would not tolerate the introduction of any other trout.

Quarrelsome Trout.

As an illustration of this fact, the writer says: "The trout themselves appreciate these differences. An American gentleman who greatly admired the violet spots upon the flanks of the trout in a friend's lake, was much pleased when his friend's little son brought him a dozen fine specimens of the coveted fish in a pail of water. As they were quite vigorous, they were quietly turned out into his own lake. There was a commotion in the water soon afterward. Presumably the regular inhabitants objected to the visitors, for the next morning they were found dead at the shallow edge of the water, their bodies bearing signs of warfare."

The whole story seems rather strange, particularly that portion of it which relates to the introduction of the young fish into water not their own; they were presumably young fish, since there was a dozen in a pail of water, but that they should show "signs of warfare," and finally find their way upon the beach to die in peace one can hardly believe; for, as a general thing, when a large trout succeeds in capturing a smaller one he pouches it without any waste of time. Furthermore, that there are thirty-two distinctly marked varieties of trout in as many Laurentides lakes is almost as incredible. So far as I have been able to discover, we have but one *S. fontinalis*, and I have handled the fish upwards of fifty years, having taken them not only in the trout waters of many of the States, but also in all the Provinces of the Dominion, and have even creeled some from the Laurentides lakes above named, and have never been able to discover such peculiarities of markings and coloration as would be necessary to constitute a distinct variety.

Variouly Marked Trout in the Same Lake.

In fact, I have taken a number of trout in any one lake, each of which was marked more or less differently from the others. Every angler in the Rangeleys or other similar chains of lakes has had the same experience, one of his catch perhaps being dingy, almost of a dirty gray color, with quite obscure markings; another may be of silvery brightness, and the next having almost the beautiful high coloration of the autumnal fish.

In Lake Edward, P. I., where the trout are generally as highly colored as they are in any waters, one often takes a sombre gray or dirty brown colored fish, and in his creel he will have all shades of coloration, the bright-hued ones predominating, of course. One has a similar experience in fishing a mountain stream, some of his fish being almost as silvery as a fresh-run sea trout, and others, taken not three rods distant, bearing most beautiful hues. The Lachine correspondent, in treating of the varieties of coloration of trout, very truly observes: "No one attempts very seriously to reason why it is so, for the clear, soft water has every appearance of being alike in all the lakes, the vegetable growths are the same, and food conditions vary but little," and I shall not attempt to here. And yet a number of facts have passed under my observation which, in a way, seem to bear out the statements the correspondent has made.

Coloration of Brook Trout.

For example: There is a mountain stream which empties into the Androscoggin River near Gilead, Me.,

called the "Wild River." It takes its rise far away among the mountains of New Hampshire. I have fished that picturesque stream many times with a great deal of pleasure, for I almost always was able to fill my creel, and the trout were most beautiful fish, being almost as silvery white as a sea trout, but marked in every other way like the typical *fontinalis*. Emptying into that river is a good sized mountain brook, which one may follow with pleasure and profit a half dozen miles or more; the trout that live in its sparkling waters are almost invariably high colored. Why the fish in these two streams are so dissimilar we cannot say, for the water in both is practically the same, and their rocky bottoms contain no sediment or decaying vegetation whatever. Another example: Between the two lower of the Rangeley Lakes, which are connected by a stream of considerable size called the "Rapid River," is a large pond a mile or so in length, and a half mile in breadth, which is called the "Pond in the River." The fish that make that pond their permanent home are nearly always highly colored, and in form they are what might almost be called "hump-backed;" that is to say, their backs, instead of being almost straight as they are in trout ordinarily, are arched very considerably upward; their rich coloration and peculiar form are so entirely characteristic of the fish that if you take a number of them and an old-time angler sees them, he will invariably say, "Ah, you got those trout in the Pond in the River, didn't you?" Now, the trout from the lake above pass freely up and down the river into and out of the pond, and they live in amity and peace with the others, neither being as combative as those described by the Lachine writer, but I doubt very much if they mate with the others, and the old race seems to be perpetuated in all its peculiarities of form.

Another example: In the great Brook Pool in the Margaree River, Cape Breton, you will take trout of every conceivable markings and coloration, from the silvery white of the fresh-run fish to the yellow and brown of those which have been in the river a long time. While in the large pool, known as "Solomon's Cellar," every fish is most brilliantly colored even in mid-summer, and the pool is on a stream which empties into the Margaree less than a mile from the other.

Another example of the diversity of coloration and I am done. Four or five miles from Malpeque, P. E. I., is a pond which contains great numbers of trout. I never took one there that weighed over a pound, and they are not particularly gamy, although they come to the fly with the greatest avidity. Now, if you take a dozen of the fish at one end of the pond you will find that all of them are bright and handsomely colored, while an equal number caught at the other end will be of a dirty gray color, their backs and the upper portions of their sides being almost black. Why these fish should differ so in one not very large pond we can only conjecture, but the fact is there beyond dispute.

A friend who was on one occasion fishing with me there, suggested that a certain number of the trout schooled by themselves in given localities, and that their coloration was affected by certain vegetable growths or by pigments absorbed by mineral deposits. That theory may be correct, but why all the trout did not absorb that pigment is a puzzle.

EDWARD A. SAMUELS.

John Haney and the Man from Creede.

DENVER, Colo., July 9.—The past week has been a disappointing one for the angler. Too much rain; the streams are far and away too high and muddy. There are a few notable exceptions, among them the catch of young Oscar Brinker in Platte Cañon. He displayed a beautiful German trout of 6 pounds which he killed with that best of all flies for Colorado waters—the royal-coachman. Captain Jack Harris, whose name carries with it the aroma of borderland days, comes up from Dallas, Texas, once a year and angles along the cool and inviting places of the Platte. Friday his industry was rewarded by a catch of five, whose total weight placed him pretty close to the limit for a day—25 pounds.

A. B. Mauff, a Denver alderman, and John E. Willard, a railroad man, therefore beyond cavil on the score of veracity, tell me the following. I can readily believe it, since some years ago, on Jackson River, Virginia, I successfully landed a full-grown mallard by means of a back cast, after an exciting fight of several minutes, in which a brindle dog and an irate farmer figured largely.

"Jacob Housman was casting for trout in the Gunnison on July 4 at Iola. It was late in the afternoon—dusk, in fact, was falling fast, and the ubiquitous bullbat or night-hawk was swirling and swooping up and down in search of winged prey. Mr. Housman almost jerked his arm out of socket just as he had completed a back cast and started to cast again. Recovering himself he was surprised to see his tackle go soaring into the air straight in the wake of a bullbat. He yelled for assistance and carefully played his catch until it was finally landed. The strange part of the tale is that the bat had been hooked in the mouth, showing that the catch had apparently not been an accident, but was due to design of the feathered quarry, who had deliberately taken the fluttering bit of feather." In the case of my duck in Virginia, the hook had accidentally whipped into the under part of its neck.

One of my correspondents at Bailey, in Platte Cañon, who is far better grounded in common sense than orthography, sends me the following:

"Yours of 24th inst at Hand. I hav not bin in Bailey mutch this seeson; but was tryin my luck at fishin a cupple of times. 1st time, in one and one-half hurs, my catche was 20 trout, weight 11½ pounds, largest 2 pounds; second catch, ½ hour, 7 trout, largest 2½ pounds.

"I think there is good fishin in this cannon, but the fishermen must not go & look to see if the fish is there before he cast his Hook well bated. and not keep his rod on the fly all the time, but kept out of sight, as our trout has no eyebrows and can see up."

It might be well for many of those who have not studied the habits of the wary speckled ones to bear this physical imperfection in mind when approaching likely pools.

Reports from the Big Laramie in Wyoming are encour-

aging. Dr. P. V. Carlin, of Denver, is just back with a glowing account of encounters with many big ones. He also backed up his yarns with material exhibits in the shape of a trout dinner Thursday night. Several of the exhibits tipped the scale at 5 and 6 pounds. Dr. Carlin was accompanied by a number of Denver business men, but I was unable to get their names. All report excellent fishing both up and down the Laramie a distance of 25 miles either way from Laramie City.

It is regrettable that the mining interests of the State clash so frequently with the interest of the sportsman; and it is doubly regrettable that in such cases the sportsman is the one to suffer. This time it is the pollution of the Rio Grande River in San Luis Valley, one of the finest trout streams of the entire West. Mining men are filling the main stream with mill tailings at Creede, and reports say that trout are dying off rapidly. The sport at Wagon Wheel Gap, where I had hoped to spend the summer vacation, is practically ruined by the pollution, and only the south fork of the river remains for the pleasure of the health seeker. Reports have it that the mine owners are doing their work openly, probably due to the supineness of the State officials, whose commercial instinct far outweighs anything else.

Here is a story told me by Charley Sloat, general agent of the Rock Island at Denver. Of course it is true. John Haney is the owner of a ranch on the Rio Grande. He is a pioneer and has been in possession of his land for thirty years. He owns both sides of the stream a distance of six miles, and pending adverse decision by the Supreme Court of the State, holds that he owns all the fishing rights pertaining. Haney is a characteristic Westerner—rawboned, bronzed of skin, snow white of beard and eyebrow. A dead shot, quick at resentment, simple as a baby, hospitable as a Southerner, and just as jealous of his rights. A few days ago a saloon man from Creede ventured on the Haney preserves without as much as saying "by your leave." When Haney came upon the man of ginslings and highballs the latter was busy reeling in one of the big ones for which Haney's waters are noted.

"Get out yourself," was the rejoinder of the Creede man to Haney's salutation. "No, it ain't your land. I did not ask you, and I ain't going to ask you nothing. If you don't like it you can go to h— or any other old place. Don't bother me; this is my busy day. Who are you, anyway, you old chuffe-headed jimplecute you?"

"Get off," said Haney, from across the stream. "Go chase yourself," said the funny man from Creede. Haney's rifle snapped spitefully, and the Creede man's rod fell to the ground, cut off at the butt.

"Say, you blithering old idiot, you, the next time you come to Creede I'll punch your head off your shoulders for you. Just you remember that, will you?"

Haney scratched his head thoughtfully a moment, and delivered himself thus: "I guess my scrapping days are about over, but if you are itching for a fisticuff, I can accommodate you. There is a bridge a half mile above here. Just walk along the bank till you come to it. I will wait for you, and when you get there you can begin your contract of punching my head, and get it through before you go back to Creede—if you ever do go back."

But the Creede man did not accept. J. D. C.

Fishes' Provender.

I do not see why Dr. Piatt should feel nervous over his story about a frog climbing a tree and devouring the woodpecker, feathers and all, that he found in the frog's gullet.

Up at Woman's Lake they told me of a 38-pound maskinongé caught with the leg of a duck—a full-grown green-head mallard—sticking out of its mouth! Now, what excuse had this musky for striking at a spoon? It certainly could not have been hungry, for besides this full-grown mallard they found a 3-pound wall-eyed pike and a 2-pound bass in its "in'ards."

Now, this takes me back to the question of why a maskinongé bites at a spoon. I am, from my late experience, inclined to think that, like a salmon rising to a gaudy fly, it does so either out of pure fun or out of resentment. Now, here's my experience. When I reached Kahekona Camp, I found that the bass were biting very poorly, those taken showing a presence of spawn in their sacks. So it was fair to assume that the fish were yet on the spawning beds. I tried them a day with a fly, but with poor success, and laying aside my fly-rod I rigged up my bass-rod, and for a week, day in and day out, worked the bars and maskinongé weed beds through rain and shine, with no results. I did get some strikes, but they were of a kind that set me thinking. Certainly my lure gave evidence of contact, and momentarily the rod bowed to the tension, but it was but a fleeting strike. Now, here's the way I figured it, namely, that working a bar or weed bed say a dozen times to and fro, the fish, exasperated to the limit, would butt at the shining, gaudy intruder over its domains as a bull would butt at a fence. In doing so, perhaps the hook would scrape the snout of the fish and make the strike, such as it was.

Maskinongé shed their teeth as deer shed their horns, and when teething, so to speak, I presume they go through a forced hungry period. The fish caught at Woman's Lake July 4, a description of the landing of which I have just sent you, I understand its teeth were in process of shedding.

Well, the fact stands that from 7 A. M. until dark, with perhaps a couple of hours for an *al fresco* lunch under the trees at noon, I patrolled these bars and weed beds with a perseverance worthy of a better cause and better luck. However, I was so delighted with the fresh air, the warm sun, the clouds and trees and birds innumerable in the young second growth springing up where the pines once stood, that I took my luck good-naturedly. So much so that faithful Peter nearly rowed his arms off to get me that maskinongé. I presume he thought me some strange being—a sort of piscatorial Mark Tapley—and he was bound to have me get something because I neither complained or damned my luck, but actually seemed as greatly delighted with the situation as if I had landed daily a 50-pound fresh water wolf.

He did not have much confidence in my landing a fish on my light lancewood rod and tackle, as he saw nothing as a rule but steel rods, and I think he was patiently waiting to see what would happen if I struck a big one. "May

be," he said, "it will take you all night to land him, but I'll stay with you if it takes until sunrise." Peter is a Dane, and when young enlisted in the Russian army and was at the siege of Plevna when Kourapatkin—the same, I expect, who is now facing the Japs in Manchuria—won the day. I listened by the hour to his graphic description of his army experiences, especially as to the taking of Plevna.

Yet Peter was not a talkative guide, and I presume I made him talk. And that reminds me of a story. A lawyer came to camp one night and as he stepped upon the stage greeted the camp manager in this style: "Mr. So and So, I have come up here to rest my weary brain, and I want to know if you can give me a guide who will not talk. I did not come up here for social ends with my guide; I have come up here to fish and rest my tired brain." And the manager, selecting one of the best and, if anything, the most taciturn guide in the camp, told him as to the desires of the man with the tired brain. "I'll row the—the gentleman," and what the outcome of the trip was I never learned, for the guide never told.

Now to get back to what a maskinongé will do out of hunger or deviltry. I saw a pair of wood ducks leisurely skimming the water's edge, when out of the weeds sprang a maskinongé, striking at, but missing, his feathered quarry. It was a fish fully four feet long, and I plead guilty to regretting that he did not strike his duck. I think there would have been an exhibition of fin and feather had the fish "sot" his teeth well into the leg of that duck. Feathers would have flown surely, and the outcome no man knows. One night when up at Lake Ida on the Great Northern Railroad up in Douglass county, I was being rowed toward the camp. It was between nine and ten o'clock, and we were late because we had fished until dark at the upper end of the lake. There was no moon, and no sounds disturbed the evening calm but the splash of the oars and the ripple of the water against the bow of the boat. Out of the stillness came a frightful quacking of a flock of ducks offshore as they noisily left the water. A swish and a dripping of water for a moment, and then a boom! as the heavy body struck the water, and all was silence again. The ducks may or may not one and all have escaped with a whole skin, but one thing was certain, some gigantic northern pike or pickerel was hunting for his supper, and thought he would vary his bill of fare from whitefish to raw ducks. So after all that full-grown mallard that was swallowed by the 38-pound maskinongé may have had some truth in it.

Just one more on Peter and I'll quit. They made him deputy game warden. He was new at the work. He had been cautioned particularly as to moose poachers. One day he heard the horn of a moose caller at noon, and away he went on a still-hunt for that poacher. Again at dark he heard the same call and on he kept, faithfully searching for the miscreant. At sunrise after a careful survey of the woods, he, in the distance, heard that same moose caller plying his nefarious trade. It was the most baffling pursuit he ever took up. Three days and nights did he dodge through the pines and underbrush in the slashings, but to no avail. At evening he came up to the lumber camp, and when waiting for the supper at the camp he saw the cookee come out from his shack and blow a long wailing blast on his dinner horn. Peter had at last found his moose poacher. CHARLES CRISTADORO.

Fish Stocking in New Jersey.

From the Annual Report of the Board of Fish and Game Commissioners of New Jersey.

IT is now nearly a decade ago since the work of stocking the waters of the State with fish not indigenous to them was begun with some system. As far as the angling fraternity was interested, the ponds of the State some fifty years ago were divided into "pickerel ponds" and "perch ponds." The former also included pike, for no attention was paid to the difference between pike and pickerel. Although some of our larger lakes and streams contained both pickerel, pike and perch, there were many ponds which contained only the one variety, in addition, of course, to the sunfish, catfish, and the different varieties of small fish generally designated as "bait." Perhaps the first stocking that was done in New Jersey was the planting of pickerel in perch ponds, and of perch in pickerel ponds. The success of this is at the present day attested by hundreds of the smaller sheets of water in the State. Next came the black bass. Residents of New Jersey in territory adjacent to that of New York had heard of the gamey qualities of the two varieties of the bass and there was naturally a desire to see what these fish would do in New Jersey. According to statements made by residents along the shores of Greenwood Lake, that large body of water was originally stocked with fifteen black bass, seven of the small-mouthed variety and eight of the large-mouthed. Five years afterward Greenwood Lake afforded the best black bass fishing ever known there. It will be conceded that the early attempts at stocking in New Jersey met with gratifying success.

The work of stocking our streams and ponds with adult fish from the Great Lakes has been in progress for nearly a decade; time can only tell whether it has been a success; in the opinion of a great many people time should have told so long ago. Judged by the results of the introduction of the pickerel and black bass, the attempted introduction of pike, perch, channel catfish, calico bass, crappies, and other fish from the west has been anything but a success. Although there is ample evidence to show that some of the fish have multiplied, they have not done so at the rate the pickerel and bass did. Your Commissioners have done all that can be expected of them. We bring the fish here, but we cannot compel them to propagate. Nor do we believe that a persistence in this work would be warrantable at the present time, both in view of the doubtfulness of the experiment and the fact that our efforts can be directed in other ways less attended by experiment. If the fish brought on from the Great Lakes had found our waters as suitable to them as did the black bass, they would have testified so in a very decided manner, just as did the bass in Greenwood Lake a few years after their introduction. There are instances in fish distribution where the introduced spe-

cies did not assert itself until many years after their first introduction; it is to be hoped that this will be the case in New Jersey, but the slight chance of the eventuation of this proposition does not, in our opinion, constitute a valid argument in favor of a continuance of bringing fish on from the west.

Why has the introduction of the fish from the west not been attended with more marked success? That question may, perhaps, be answered in the future, when fishculture shall have made more progress than it has at present; to-day it is unanswerable. There may be something in our water agreeable to the indigenous fish and the black bass but repugnant to the introduced species; the latter may find the food in our water foreign to them, or there may be enemies in our water destructive to the emigrants; in any one of these or many other events, the introduced fish fail to multiply even if their own existence were continued to the ordinary span of their lives. Persistent attempts at the introduction of fish which decline to multiply here would be injudicious. (It has been suggested that perhaps an addition to the food supply of our fish might be advisable.) The origin of the sustenance of fish is in the fertility of the soil under the water. It is this soil which produces the vegetation in the water; on this vegetation thrive the minute forms of animal life on which the small fish feed and these smaller fish are necessary for food to the larger. If one link in this chain is broken, all fails, and science has not advanced far enough to indicate what can be done in the case of such failure. The farmer, no matter how well versed he may be in agriculture, cannot tell you how it is that one year he has an abundant apple crop and the next year not enough for pies for his own family; still the farmer has the trees, the soil and all the surroundings before him; in the water its surface frequently constitutes an impenetrable veil, a veil at least which science has so far failed to lift.

The axiom in fishculture which is so frequently lost sight of is that a water's ability to produce fish is in direct proportion to the food supply in it. A farmer who has a pasture field in which ten sheep and their progeny can find sustenance for the season would be considered foolish if he were to place five hundred sheep there; still this is just what some people imagine the Fish and Game Commissioners should do; if 100 fish do not find food in a certain water, put in 1,000; if these 1,000 starve, put in 5,000. Attempts at the distribution of what is commonly called baitfish have been made before. The fresh water herring, so abundant in Lake Hopatcong, are also found in many other large bodies of water, and attempts have been made to place them in other waters. We know of no single instance in which such attempt was successful in the measure we hoped for. In some instances the herring multiplied until, for lack of food, they were picked up dead in large winnows along the shore; they found the new water suitable to their domestic arrangements, but they and their progeny devoured all the food and by doing so not only destroyed themselves but also the other baitfish, and as a natural consequence, the larger fish. In other cases the herring were never heard of, just as was the case with the attempted introduction of the fresh water smelts in Greenwood Lake and other waters of this State, an attempt which was made by the Fish and Game Commissioners some seven or eight years ago. Although in the large waters of Maine, the State Commissioners do not introduce salmon, trout, and other of the nobler kind of game fish until the fresh water smelt of both the large and small varieties have been well established, their introduction in the waters of New Jersey proved an absolute failure. Any interference whatever with the admirable balance which nature has established in the animal kingdom is more apt to lead to failure or mischief than to success.

There is, however, no reason why the distribution of the black bass, the pickerel, the pike and the perch should not be continued. The State's supply of these fish has been drawn from the Delaware and Raritan Canal and the taking of these fish from this water served the double purpose of continuing their lives and placing them in water where their presence would be of value to the public. If left in the canal they would be destroyed by the wheels at Trenton; if removed, they infuse fresh blood into the same kind of fish found in other waters. This, however, occupies comparatively little time and for a limited period each year.

A New Jersey State Preserve.

From the Annual Report of the Board of Fish and Game Commissioners.

THE time and money which will be left at the disposition of the Commissioners and wardens by the abandonment or curtailment of the introduction of fish from the Great Lakes we feel may be used with better results in looking after the supply of game, and this is not a question of experiment.

The ever-increasing population of the State, with the proportionate increase in the number of gunners and the continual reduction of the territory available for the propagation of game, have rendered legislation of a more and more restrictive character absolutely necessary. But the time is coming when even the most drastic of prohibitive measures will not meet the requirements and our game may be exterminated, no matter how short the open season may be. It is time we looked for replenishment in some other direction, and the only method we can suggest is the establishment of game refuges in the State. At a first glance this proposition may seem a little too near akin to the establishment of preserves, something the people of New Jersey would not take kindly to, but we believe that a plan might be devised by which the public may have all the benefits arising from preserves without any of the objectionable features. New Jersey, populous as it is, is a State admirably adapted to the preservation of indigenous fauna, for hundreds of acres of wild land may be found within an hour's ride of the great cities of New York and Philadelphia.

The first matter to be considered in the establishment of a game refuge is the probable cost. This need not necessarily be large, and your Commission has no

intention of applying for an additional appropriation for the purpose, feeling confident that the time and labor saved from trips out west after fish will be sufficient to give the matter of game refuge a trial. We have no doubt that a large enough area of well-watered woodland can be secured in New Jersey at a low annual rental for the establishment of at least one refuge. A lease for five years, with the privilege of purchase, would involve an inconsiderable outlay of money and would be sufficient to test the availability of the project. The number of our wardens is sufficient to provide for the care necessary to be taken of such refuge; the artificial propagation of some of the fauna is a matter of exact science and what has been done profitably by individuals can be done in a like manner by the State.

The first purpose which such a refuge would serve would be the prevention of the extermination of our native birds. Absolute prohibition from shooting or tramping would, of course, be requisite to success, and this could be attended by the wardens placed in charge. The instinct of all kinds of game is to seek places of security. It is the experience of all who have gunned on territory adjoining large preserves that when they once get a shot, say at a bevy of quail, the birds will at once betake themselves to the preserved territory, knowing that they are secure from molestation there.

In this way we would have a place where quail, ruffed grouse and hare might always be found, and from which the surplus of the quail and rabbits, at least, might be transplanted to other parts of the State, in addition to the good gunning to be found in the immediate vicinity of the refuge. If any of the foreign species of hare recently introduced in this country can be acclimated here the best opportunity therefor would be afforded by such a place of refuge and absolute security.

An advantage which would accrue to the benefit of the angler would be the more extensive distribution of trout. It is well known that by the artificial propagation of trout as high as ninety-five per cent. of the eggs have been brought to maturity, whereas if left to their natural resources it is a question whether even five per cent. of the eggs would develop into fish. Thousands of dollars have been expended in New Jersey for the distribution of fingerling trout, and the larger part of this sum of money has gone as a profit to the owners of private hatcheries. All this might be saved, and that with an increase in the number of trout to be distributed. Small hatcheries have been established in numerous places all over the country. The cost of establishing and maintaining a small hatchery, amply sufficient for all the demands of the streams of New Jersey, would cost but little more than the sums now annually expended in the purchase of trout from the hatcheries, and give the State a full supply.

But by far the greatest benefit reasonably to be expected from the establishment of a game refuge would be the introduction into the State, for the benefit of the public, of the Asiatic pheasant. Three kinds of pheasants, the English, the ring-necked, and the Mongolian, have been established in various parts of this country in latitudes as high as that of New Jersey. Our native grouse is becoming scarce, and we know of no bird at all suitable to take its place other than the Asiatic pheasant. This has been done elsewhere and there is no reason why it should not be done in New Jersey.

An attempt of this kind was made in New Jersey a number of years ago and proved a failure, but this can be readily accounted for. The State purchased considerable numbers of the ring-necked pheasants and distributed them in various parts of the State. There was no law whatever prohibiting the destruction and possession of this bird. A measure was passed by the Legislature prohibiting their killing for three years, but it was vetoed by the governor, as it was only a part of a general measure, some features of which did not meet the approval of the executive. Consequently, the measure, with the good as well as the objectionable provisions, was vetoed. This gave gunners and others a full year in which not only to shoot, but to trap the pheasants. In no place were the birds secure, and, consequently, it is rather a matter of surprise that some were found as long as three and four years after their liberation. In addition to this, the fact must be considered that the birds were more or less of a domesticated nature, having been bred and reared in confinement.

Despite all these disadvantages, reports were received from several places in the State indicating that the birds did well the first year, and that their progeny showed nearly all the wildness of our native grouse.

By the establishment of a game refuge the cost of these birds would be materially reduced. Immediately before the breeding season the market price of these birds ranges from \$4 to \$6 a pair, and they are frequently difficult of procurement even at the higher figure. The hens are prolific in the laying of eggs, and although the best method of developing them is still by placing them under common barnyard fowl, it has been shown by ample evidence that the birds will develop their own eggs if not interfered with. At any rate, we see no reason why on a State game refuge we should not accomplish what it done every year on the large preserves in this and other States. The rearing of the birds can be accomplished by following the rules laid down in books written by men who have devoted their lives to the subject, and is attended with very little difficulty. In preserves in New Jersey as many as 10,000 and 20,000 birds have been reared in a season, and that with the attendance of men far less in number than the corps of our wardens. By far the larger proportion of these birds invariably remain within the boundaries of the preserve where they are reared, so that in the case of the State game refuge only the second generation, partaking more of a wild nature than the first, might be used for the purpose of distribution to other parts of the State.

Of the three kinds of Asiatic pheasants the preference undoubtedly would be given to the ring-necked variety. On the preserves in New Jersey the English bird is preferred, but this is due to the fact that it is less liable to stray away from the place of its rearing,

and because it is not so hard a flyer, thus forming an easier mark for the gunner. A law prohibiting the killing of English birds altogether would be on injustice to the owners of these preserves, and such a law, as far as the pheasants to be reared on the State game refuge are concerned, would be an absolute necessity.

In some of the western States the Mongolian bird has done well, and it would cost very little to try an experiment with a few of these birds, although their characteristic tendency in the west has been to travel many miles away from home. The ring-necked, although also given to roaming, but to a far more limited extent, would probably prove the better bird for the needs of New Jersey. A law prohibiting the killing of ring-necked and Mongolian pheasants for a term of years would do no injury to any person, for there are none of these birds at present in the State, and such a law would be absolutely necessary to the successful establishment of a game refuge.

The Monarch of the Pool.

He was Monarch of the Pool, king of trout, and emperor of the domains he specially regarded as his. He was an autocrat, and, like autocrats, he was despotic. His slightest wish was law, and on occasions when recalcitrancy showed itself, he always found means of enforcing obedience. Among his trout subjects he was feared and hated. It must, however, be admitted that these were far from numerous. On the slightest offense, and, indeed, on no offense at all, he ate them up. The consequences of aquatic depopulation were in no wise dreaded by him.

Time was when he was rather a nonentity in the trout community. Full of young life and juvenile propensities, he had sported over the sandy bottom, and in and out among the boulders that littered the bottom of the Pool. His sportive faculties not infrequently roused the wrath of the older and more sedate members of the community. These, being older, were, of course, very much larger than he was, and he knew that such chastisement as they would inflict would at once put an end to his earthly, or rather watery, career. Such, indeed, had been the fate of several of his playfellows. After having been duly punished for delinquencies from proper decorum, they had formed a toothsome repast to the austere enforcers of law and order. Once or twice the future Monarch had run narrow escapes of suffering the same fate, but he always managed to betake himself to some narrow interstices between the boulders, where he knew his enemies could not penetrate. Such attentions were the bane and terror of his life, and solemnly did he vow if ever he attained the full maturity of trouthood to exact a dire revenge.

Gradually he found himself growing in size and strength, and just by way of training for the after eventualities of life, he commenced practicing attacks on the smaller fry, such as he had once been himself. As he swallowed up these he found his own proportions perceptibly swell, and in order to obtain a speedier vengeance on his persecutors, he became their most active oppressor. Soon he attained a size which rendered him comparatively immune from unwelcome attentions, and this enabled him to unrestrainedly vent his vengeance upon those who were in the least degree smaller and weaker than himself. Eventually the dominion of the Pool rested with him and another two, and as the powers of all three were about equal, they prudently avoided attacking each other. At last one of these was foolish enough to swallow the lure of an expert angler, while the second fell prey to a wandering otter, and thus the Monarch of the Pool attained supreme sway.

He proved a very jealous monarch. Thoughts of the possibility of having to share his rule with another were always present in his mind. To prevent this, and, at the same time augment his strength, he devoured every trout of any considerable size that ventured within the precincts of the Pool. Nor were the smaller fry intact from his inroads; but these found safety in his own previous tactics, and bitterly did he now curse the interstices which had formerly stood him in such good stead.

All this while, however, he had to guard against the machinations of another enemy, and that was man. The tempting lures and baits with which he had been plied had oftener than once almost proved his undoing. When a very small trout, indeed, he had seized what appeared to him to be a very toothsome, gaudy fly, and been landed on *terra firma*. Luckily for him the kindly angler felt that his basket would be disgraced by the presence of so small a specimen as he then was, and he was thrown back into the water. This perilous adventure ever after made him chary of flies, and it was only after careful observation that he ventured to add them to his menu. Again, while nibbling at a nice succulent worm he had received a sharp wound, and later, while attacking a minnow, his jaws had been severely lacerated. So shrewd did he become from these experiences that to ordinary human artifice he was absolutely invulnerable. As the fame of his proportions spread, so, in like ratio, did the ambition to prove his undoing. In angling circles nothing but the "big trout" was spoken of, and he was plied with lures of every description, from the clumsiest to the most highly finished, by peer and peasant alike. But the Monarch regarded these attempts with silent scorn; the experiences he had already undergone safe-guarded him against similar perils.

It was while his fame was at its zenith that Messrs. Brown, Jones, and Robinson appeared on the scene. They had come down from London on piscatorial holiday bent, and each provided with a brand new outfit of the costliest and best quality. No one could have been more innocent of all knowledge of the art of "Old Isaac" than were those three. They had never angled before; indeed, it is questionable if they had ever seen a trout, yet they came down filled with visions of well-filled baskets. They put up at the best hotel in the neighborhood, and, of course, were soon made aware of the existence of the Monarch of the Pool.

What they were told filled their bosoms with ambition, and next morning they sallied forth in high hopes to commence their attack upon the grim old autocrat. All three reached the Pool, and all three commenced operations simultaneously. They maintained their positions

throughout the whole day, but we refrain from inflicting upon the reader the description of their operations; suffice it to say they afforded unbounded merriment and amusement to a party of peasants at work in an adjoining field. For several days they resumed their attack, but with no better result, and their ardor becoming somewhat damped, they turned their attention to less renowned members of the finny species. Still success failed to attend their efforts, and having for more than a week returned to the hotel with empty baskets they were subjected to a good deal of banter by other anglers; while, as far as the Monarch was concerned, they were ruled entirely out of the running.

At last they began to return with several small trout in their baskets. These they were supposed to have caught with rod and line; but such was not the case. As a matter of fact, a schoolboy had initiated them into that primitive form of angling known as "gudding," or catching the trout under stones and banks by means of their hands alone. At first they were rather fearful the trout would bite their fingers; but on this they were reassured by their juvenile instructor. Henceforth they might have been seen wandering on the banks of secluded streamlets, divested of coat and hat, with shirt sleeves rolled up to the shoulders, plunging their arms into the water in search of the shy and retiring trout.

"Hang it all! Let's rusticate a little," said Brown, as the trio again found themselves by the Pool, after having spent the earlier part of the day in "guddling."

"What do you mean?" queried Jones.

"Why, dress and cook some of the trout we have caught for lunch," was the reply.

The proposal was unanimously accepted. Brown proceeded to gut and clean the fish; Jones made a fire out of dry twigs which he collected; while Robinson proceeded to construct an improvised grill out of some pieces of wire that lay handy.

Soon the freshly caught trout were twisting themselves into circles on the grill placed over the glowing embers, and several burnt fingers evidenced the difficulty experienced in turning them. At last they were declared "ready," and lunch commenced. The grilled trout were pronounced splendid, but owing to the primitive method of cooking there was much waste, and Robinson, who sat facing the Pool, threw fins, tails, and burnt parts into the water.

The Monarch who lay visible and almost stationary on the sandy bottom, saw these particles invade his domains. To him their appearance was altogether new. He eyed them critically. That they were edible seemed apparent, but were they simply another machination of his arch-enemy, man? No, he thought not. After a good deal of close observation and consideration, he at last ventured to appropriate a piece. Evidently he found it very good, for he ventured on another, and, gradually getting bolder, he gobbled up the pieces as fast as they were thrown in the water.

Robinson at last noticed this. "See," he said, "the big fellow is swallowing up the refuse as fast as it's thrown into the water."

"Probably he prefers trout cooked to trout raw," rejoined Jones.

"Stop," said Brown, "let's put a hook inside a piece."

The proposal was at once adopted, and a hook was carefully concealed inside a small piece of fish. A sufficient length of line was drawn out, and the bait thrown into the water. His suspicions lulled by his previous experiences, the Monarch at once swallowed the piece of trout as he had done the others. Brown seized the rod, and found the "big trout" firmly attached.

But the Monarch showed fight, and success certainly appeared to favor him. Brown had no idea of running a fish, but simply hauled with might and main. Rod or tackle were in imminent danger of breaking; in fact, had they not been of the very best quality, they must have done so under the strain to which they were subjected.

"You blockhead! do you want to break your tackle, and lose the trout after hookin' him? Gie me the rod, and I'll land him for ye," sounded the rough voice of a rustic, who, happening to pass at the time, saw what had occurred and what was likely to ensue.

Brown prudently handed the rustic the rod, and after a quarter of an hour's excellent sport, the Monarch caved in, and was drawn unresistingly to the side. All three dived at him with their respective landing-nets, and, fortunately, in one of them he was enmeshed, amid the uncomplimentary epithets of the expert rustic.

The jubilation of Brown, Jones, and Robinson was only equalled by that of the small trout in the Pool, who were thus relieved of the iron rule of their autocratic despot. A handsome donation silenced for a time the volubility of the friendly rustic, and the worthy trio became the heroes of the hour. Next day they departed, bearing with them the remains of the defunct Monarch, to have them preserved as tangible evidence of their prowess as anglers. Verily, ignorance and luck sometimes succeed where knowledge and skill signally fail. In proof of this, if any is required, we need only quote the case of the "Monarch of the Pool."—Tom Buidh in *Illustrated Sporting and Dramatic News* (London).

Altered Fishing in the Hudson.

OSSINING, N. Y.—*Editor Forest and Stream*: Reading at different times of the pollution of streams in different parts of the country, I would ask for an explanation through your paper of the reasons for the altered condition of the Hudson River at this place from a fisherman's viewpoint. Twenty years ago it was no uncommon thing for parties to strike into schools of weakfish here, often as many as twenty being caught on a single tide. Striped bass were also plentiful then, and flukes were not uncommon. I can remember playing "hookey" from Sunday school once twenty years ago, and of course the docks along the river front were the attraction. It was early in September and altogether too fine a day for Sunday school. I walked out on "Pete" Smith's dock and absent minded picked up a bamboo pole which had been thrown down by some tired fisherman. There was a piece of stout twine for a line and a common ringed hook, on which was hooked a strip of well dried moss bunker. It was not an inviting Sunday meal, and as I whipped it off the end of the dock I was not prepared for the sudden

shock which nearly pulled me overboard. I tugged and pulled and yanked, and the old pole nearly bent double, but the fish more than held his own. Two fellows ran up to help me, but "Pete" Smith—long may he wave!—said, "Let the boy alone, he can handle him," and up he came over my head and far back on the dock. As he struck, the hook pulled out straight and the fish was loose, making great leaps for the water. "Geel!" I thought, "supposin' he gets away?" Sunday clothes and all I made a wild jump and landed on the fish.

I saved him all right, and when the smoke cleared away I had a bluefish weighing $2\frac{3}{4}$ pounds plump. I did not dare take him home. I got separated from the scales which rubbed off in the scuffle, and went home, conscious that the afternoon had been well spent. When my father passed the dock entrance the next day, "Pete" Smith had the fish there for him all nicely cleaned and he "gave away" my fishing experience of the previous day. But "Daddy" didn't care much, and made me tell him all about it again.

Two years ago quite a number of weakfish were caught here. When the run first started, probably a half dozen were caught on lines. Within three days numbers were lying, or rather floating, on their sides on the surface, gasping, and were easily scooped from boats. There were formerly miles of fine oyster beds opposite Ossining on the flats; now there is nothing but beds of shells. Shad and bass were caught by the ton twenty years ago, and many families made good living with their seines and gill nets. They have long since abandoned their seines, and the seine "crabs" are rotted from disuse.

We have the choice of two things: to believe either the fish are being caught for the market in such numbers that the demand and supply is greater than the natural production, or chemical waste and gas-house tar are polluting the waters of our noble river to such an extent that it is habitable only to such river fish as perch, catfish, and eels. Without fish the Hudson becomes a weary waste of water.

CHAS. G. BLANDFORD.

Santa Catalina Tuna Club.

SANTA CATALINA ISLAND.—In consequence of the unqualified success of the rod-and-reel tournament of the Tuna Club in former years, in the interests of the higher standard of sport, and the protection of the game fishes of Southern California, the Club will give an open tournament from May 1 to October 1, 1904, inclusive. The object is to encourage the use of rod-and-reel tackle in taking the large game fishes of these waters, and in every way to elevate the sport to the highest standard.

The only restrictions are the rules of the Tuna Club that rods and reels must be used and that rods must not be less than six feet nine inches in length, the tip of which must not weigh more than sixteen ounces. By "tip" is meant all that portion of the rod from reel seat to end of rod. The line must not exceed twenty-four threads or strands, and be capable of sustaining a dead weight of not more than forty-eight pounds. All anglers must bring his or her fish to gaff unaided, and the fish must be reeled in—a broken rod either before or after gaffing disqualifies the angler. The tournament is open to amateurs only, professional boatmen, those engaged in allied industries on the island, and members of their families being barred, except as in special class I.

THE PRESENT HOLDERS OF CUPS AND RECORDS ARE:

Largest Tuna.		Pounds.
C. F. Holder, Pasadena, Cal., season 1899.....	183	
Col. C. P. Morehouse, Pasadena, season 1900.....	251	
Mrs. E. N. Dickenson.....	216	
F. S. Schenck, Brooklyn, N. Y., season 1901.....	158	
F. V. Rider, Avalon, season 1901.....	158	
John E. Sterns, Los Angeles, season 1902.....	197	
H. E. Smith, season 1903.....	94	
B. F. Alden, season 1903.....	94	
Black Sea Bass.		
F. V. Rider, Avalon, season 1898.....	327	
T. S. Manning, Avalon, season 1899.....	372	
F. S. Schenck, Brooklyn, N. Y., season 1900.....	384	
A. C. Thompson, Pomona, season 1901.....	384	
H. T. Kendall, Pasadena, season 1902.....	419	
Edw. Llewellyn.....	425	
Largest Yellowtail.		
F. V. Rider, Avalon, season 1898.....	41	
F. S. Gerrish, Jacksonville, Fla., season 1899.....	37	
R. F. Stocking, Los Angeles, season 1900.....	48	
T. S. Manning, season 1901.....	33	
Dr. Trowbridge, Fresno, season 1902.....	47 $\frac{1}{2}$	
F. P. Newport, season 1903.....	46	

Prizes.

CLASS A—LEAPING TUNA.

Special silver cup, donated by Montgomery Bros., Los Angeles, for largest tuna, which becomes property of angler holding record for three successive years from present season.

For exceeding the Club record, rod and reel, donated by Edward Vom Hofe.

For the largest tuna of the season other than the above, *Tuna Club gold medal; Banning cup. A special gold button will be given to the angler taking the largest tuna of the season. Should two anglers succeed in breaking the present record, a gold button will be given for each fish.

For the second largest tuna of the season, other than the above, a silver-mounted rod offered by James McDonald.

For the smallest tuna, booby prize.

CLASS B—BLACK SEA BASS.

For exceeding the cup record, *Tufts-Lyon Arms Co. silver cup; *Rider Macomber gold medal and extra silver-mounted rod.

For the largest black sea bass, other than the above, silver-mounted rod.

For the smallest black sea bass of the season, booby prize.

CLASS C—WHITE SEA BASS.

For the largest of the season, angler's tackle box.

For the second largest, gaff.

CLASS D—YELLOWTAIL.

For the largest yellowtail of the season, *John F. Francis, gold medal and silver-mounted rod.

For the second largest fish, gaff.

CLASS E—ALBACORE.

For the largest fish of the season, silver-mounted rod.

CLASS F—ROCK BASS.

For the largest fish of the season, Vom Hofe line dryer.

CLASS G—SHEEPSHEAD.

For the largest fish of the season, angler's pipe.

CLASS H—WHITEFISH.

For the largest fish of the season, gaff.

CLASS I—PROFESSIONAL BOATMEN.

For the best equipped launch, four horse-power or over, rods, reels, lines, gaff, and general comfort to be considered, silver-mounted rod.

For the best equipped launch under four horse-power, with or without engine, rods, reels, lines, etc., to be considered, silver-mounted rod.

For the boatman of the angler taking the first tuna of the tournament season, silver-mounted rod.

All the catches made with the view of competing for prizes must be reported at once to some member of the weighing committee, or a member of the board of directors of the club, and weighed in his presence and posted. All fish must be brought to the Club scales and weighed thereon. No allowance will be made for shrinkage.

In fishing for any fish during the tournament season, there shall be only one rod and reel used at a time for each angler occupying a boat. The using, casting, or handling of one in any way by the boatman shall disqualify the angler. This rule shall not apply to baiting the hook.

The board of directors and weighing committee comprise: T. S. Manning, E. L. Doran, F. V. Rider, John Cline, W. H. Bunham, A. W. Barrett, E. N. Dickerson.

*These prizes are perpetual property of the club, the names of the anglers being engraved thereon.

Big Trout in the Adirondacks.

Editor Forest and Stream:

I inclose clipping from the Tribune of June 25, in which my old friend, H. H. Thompson, of Passaic, N. J., tells of some large lake trout taken from Piseco Lake by Mr. William N. Courtney, one of which weighed $39\frac{1}{4}$ pounds, and another, taken by a Mr. Yost, weighing $36\frac{3}{4}$ pounds. Mr. Thompson writes:

"You printed last week an item from Glens Falls, N. Y., relating the capture by J. Ben Hart in one of the Saranac lakes of a lake trout weighing $31\frac{3}{4}$ pounds, and measuring 42 inches; claimed by the fishermen of that section to have been the largest specimen ever known to have been caught in Adirondack waters. Knowing that much bigger trout had been taken from Lakes Pleasant and Piseco, I wrote to the postmaster at Piseco for definite information. The result is a letter from William N. Courtney, Camp Courtney, Spruce Lake, N. Y., who sends me a photograph of a trout caught by himself in Piseco Lake, weighing $39\frac{1}{4}$ pounds, and measuring $45\frac{3}{4}$ inches. He says, 'There are many caught here of 34 and 35 pounds' weight. A Mr. Yost caught one on May 20, 1898, weighing $36\frac{3}{4}$ pounds.' Waubeck is distanced, so far as the size of the lake trout is concerned. Mr. Hart will have to gird up his loins and try again."

Of course I recognize the fact that the fisherman telling the last story has the advantage. I do not pretend to be a fisherman, much less an angler, but I want to remind H. H. T. of a lake trout taken from Millsite Lake, some five or six miles from this place, which weighed $42\frac{1}{2}$ pounds. This was fifty-three or fifty-four years ago. I was then clerking in a store here, and succeeded Mr. Thompson in that position in 1849. The fish was brought to the store in a wheelbarrow by Mr. Schnyder Soper, who had caught it, and I weighed it on the same scales that Mr. Thompson had weighed many a tub (I might say tons) of butter on; and he cannot deny that the scales were correct; I weighed the fish.

Mr. Thompson will also acknowledge that Millsite Lake, although small—less than three miles in length—is famous for other large fish, for within the past month I have received a letter from him saying that the largest large-mouth black bass he ever boated was taken from this lake and weighed 8 pounds.

Mr. Thompson has probably taken more maskinongé and black bass from the waters in this vicinity than any other man now living.

J. L. DAVISON.

THERESA, N. Y., July 16.

The Aggravating Ning Ning.

TO THE notes given in our last issue on fishes which have voices—and some of them having voices use them to the pestering of mankind—add this bit from Mary Kingsley's "Fishing in West Africa," being a chapter from "West African Studies" reprinted in the *Woodcraft Magazine* for October, 1901:

"Then there is that deeply trying creature the Ning Ning fish, who, when you are in some rivers in fresh water and want to have a quiet night's rest, just as you have tucked in your mosquito bar carefully and successfully, comes alongside and serenades you, until you have to get up and throw things at it with a prophetic feeling, amply supported by subsequent experience, that hordes of mosquitoes are busily esconcing themselves inside your mosquito bar. What makes the Ning Ning—it is called after its idiotic song—so maddening is that it never seems to be where you have thrown the things at it. You could swear it was close to the bow of the canoe when you shied that empty soda-water bottle or that ball of your precious india-rubber at it, but instantly comes 'ning, ning, ning,' from the stern of the canoe. It is a ventriloquist, or goes about in shoals, I do not know which, for the latter and easier explanation seems debarred by their not singing in chorus; the performance is undoubtedly a solo; anyone experienced in this fish soon finds out that it is not driven away or destroyed by an artillery of missiles, but merely lies low until its victim has got under his mosquito curtain, and resettled his mosquito palaver—and then back it comes with its 'ning, ning.'

"A similar affliction is the salt-water drumfish, with its 'bum-bum.' Loanda Harbor abounds with these, and so does Chiloango. In the bright moonlight nights I have looked overside and seen these fish in a wreath around the canoe, with their silly noses against the side, 'bum-bumming' away; whether they admire the canoe, or whether they want it to come on and fight it out, I do not know, because my knowledge of the different kinds of fishes, and of their internal affairs, is derived from Dr. Günther's great work, and that contains no section on ichthyological psychology."

The Kennel.

Sporting Dogs in England and America.

THE bare relation of the deeds of English dogs does not assist Americans one bit more than the records of sport and field trials written in America for Americans instruct Englishmen of the merits or demerits of cousin Jonathan's dogs. Possibly the differences are greater than we have been led to think. Their variations from original types are not nearly the whole, for, we, too, have been varying our sorts after the manner of our own fancies, and the directions we have taken have been dissimilar to those taken across the Atlantic. Generally there have been good reasons for both variations; what those are will assist at a perfect understanding of the status and character of American sporting dogs as compared with ours now and with ours formerly.

There is no necessity for, even if there exists a possibility of, going back to the beginning of things in the Southern States of the Union. It was, we know, greatly indebted to Spain for its planters in its early history, and it may be that the poor cousins of the Dons introduced the dogs of the country direct from Spain. Georgia is full of Spanish-looking pointers. It is, in fact, the weed of the country, for where you do not see nigger dogs you see pointers, some of them remarkably high bred in appearance, and few of them exhibiting traces of cross breeding; but there is one weed throughout the South that grows even more luxuriously than the pointers. These are nigger dogs, that are as plentiful as cur dogs of the sheepdog order in this country; but the nigger dogs are nearly all near relations of the hound. Mostly they are black and tan, and so also are the treasured American foxhounds. These latter hounds, both pure and impure, have a wonderful resemblance to English bloodhounds of fifty years ago, before the loose skin craze set in and altered the character, if it left the type unchanged. As a traveler rode through the Southern States—that is, the slave States of the anti-unpleasantness period—and found in each the same character of nigger cur, and saw how much family likeness there was between them and the black and tan foxhounds of the South, an irresistible impression was created that here were the true descendants of those bloodhounds that were used to catch runaway niggers. It is quite natural to suppose that the planters themselves would use the same hounds for both purposes of sport and business, or at least the same breeds, and it is not less so to assume that the freed nigger would hasten to possess himself of that which was once beyond his reach, and, besides, aroused his terror. The negroes are all hunters; they hunt "cotton tails" by day, and 'coons by night, and their nigger dogs assist in both occupations. Not only are these dogs in appearance like the hounds of the country, but their cry is so similar that it has been known of the master of a pack that he rode five miles after some of them, believing all the time that he was riding to his own hounds.

It will be observed from the above statement that the cry of hounds in the rough woodlands of the south is very important, for without the music it would often, if not generally, be impossible to discover which way the hounds had gone. With the exception of bloodhounds, the writer has never heard such mellow, deep voices as the southern hounds of America possess. It is the fashion for Englishmen, and some Americans, to believe that English hounds are the best in the world, but the southern gentlemen will have none of them. They say, with a certain amount of truth, that these importations have got "no noses." This is, comparatively speaking, likely enough, for generations of hurry by huntsman, field and hounds have taught the latter only to run scent that they can run fairly fast, whereas the American hounds can start work as late as noon, and trail a fox to its kennel. That is how they find every fox they hunt, and probably few of the greatest believers in the modern foxhound would hold the opinion that he could trail a fox to its kennel ten hours after it had passed.

These long-eared hounds not only have the color of bloodhounds, but also many of their characteristics. They seem to run for the sport of hunting, and not to be very particular about killing; they do not get their hackles up as English hounds do when they are running for blood. In this they resemble bloodhounds, just as they do in their cold hunting qualities, in their color and markings, in their ears, and in their voices. Maybe they are collaterals from Spanish ancestry and have not descended from our bloodhounds at all, but if that be so the likeness is quite remarkable after so many years. In appearance how do they differ from bloodhounds? Only in this, that they are more on the leg, have much less weight to carry, have far better necks and shoulders, and better loins. These are qualities that can be bred in by selection in a very few generations, or lost, as in our bloodhound, in as few by making selections for other virtues. Bloodhound crosses upon harriers or foxhounds would not bring out anything like these native hounds. The ears, for instance, are a distinctive feature, quite as much so as they are in the bloodhounds themselves; and their heads, although much lighter, are those of small bloodhounds, and not the shorter and squarer heads of harriers and foxhounds.

The system of hunting there is very different from ours. The first thing to strike one is that the whipper-in is absent. Each man who has anything to do with hounds uses a horn, that is for the purpose of letting hounds know which way the huntsmen (for there are more than one) are drawing. Riot hardly exists, because there is nothing to attract hounds' attention except foxes, red or gray, wolves, black and white, and caotes (a small kind of wolf); any of these they may hunt—first come, first served. Probably a deer would be treated in the same way, and in the winter there are no domestic animals in the fields and woods, ex-

cept an occasional sounter of pigs: animals that can take care of themselves and fear nothing on four legs.

But although these hounds can go fast, and it is said last forever, they never appear in a great hurry, and it is not believed that they could get through a crowd of horsemen such as constitute the Leicestershire fields. There are stories of forty mile points after the gray wolf, and of how these long runs end by the loss of some hounds that never return to kennel. The idea is that the hounds tail out, and the wolf, being more than master of a single hound, kills them one by one as they come up to him. But although not in these very long runs, yet in most cases single horses can generally live with hounds, and that implies that the pace cannot be, on the average, very much more than it is with us over fairly long distances. Often, though, there is no jumping to be done, and we all know how much the jumping takes out of a horse's galloping and staying powers over a heavily fenced country. But if there are no fences there are wash-outs, that is, dry water course beds, the banks of which may be a sheer 100 feet or more. That these obstacles stop hounds as much as horses may be true; but probably the hound can always go where his quarry has led, and certainly the horses, although as clever as cats, cannot. They get up with a rush and a scramble in places, but not wherever a fox can go. Once there was a splendid hunter following

a bit of a screw up one of these inclines. The screw got up, but the hunter, just too wide for the passage, jammed himself between the solid earth on both sides and could not move either way until willing hands and nails scratched away the sandy clay and released him. Taking all these circumstances into account, it seems that the American foxhounds, although vastly more sensitive of nose, are not as fast as Belvoir blood, certainly not for short spurts; on the other hand, as they go on hunting at pretty much the same pace, whether scent is very fresh and good or growing cold, it would be unwise to say that they do not cover a long run in less time than the Leicestershire packs.

The South is the only part of America fit for hunting in the winter to English ideas. What hunting is possible on Long Island in a normal New York winter is not known to the writer, but as the whole country is buried under a foot or more of snow for several months each year, hunting must be done in those months in difficulties, if at all. Mr. Foxhall Keene has taken over some of the choicest English foxhound blood, but the verdict of Americans in that northern hunt is that they have been partly a failure. However, as Mr. Keene has been re-elected master for the coming season there probably is some promise of better success with the English hounds. But in the South they will not have them, nor even crosses from them. Nothing in that country seems to thrive if it has to carry weight, and our foxhound, in comparison

to theirs, is a stout, big-boned animal—a cart horse by comparison to their racing lines. It is the same with all animals bred there; even the men are small and wiry, but never, or hardly ever, robust. In the north they have big setters and pointers; in the south these dogs, like the cows, are little things; but for things so small they have powers beyond the conception of most Englishmen. Whether it is the summer heat that makes things remain small, or whether it is the atmosphere itself that is not good enough to support large frames in great exertion, is unknown to the writer, but he is sure that puppies he took for six months old were twelve months, and that maturity arrives slowly to the canine races of the south.

In comparing hounds and setters and pointers with our English dogs it is first necessary to compare the dogs of the north and south, for there are vastly greater differences in climate in America than there are between England and Scotland. Those who have experience of such things know that no dog taken from north Britain to south can do its best, whereas the English dog in Scotland generally beats its previous best. Only at the English Setter Club Trials on April 20 and 21 this year we saw slugs of the beautiful Wednesday turned into racing machines by the cold, cutting wind of Thursday. It is always so, and this fact makes comparisons between English and American pointers and setters far more difficult than might be supposed.—Field (London).

A. C. A. National Meet, Sugar Island, Thousand Islands, St. Lawrence River, August 5-19, 1904.

The Allegash Canoe Trip.

(Concluded from page 40.)

ON the morning of the eighth, after a hastily prepared breakfast, we broke camp and started for Umsaskis Lake, twelve miles distant. Going through the thoroughfare at the foot of the lake, we saw three deer, but as yet no good heads, and having plenty of meat, did not shoot.

Arriving at Chase's Carry at ten o'clock, the guides sacked our luggage around the quiet water, a distance of 1½ miles. There were lots of rocks, and it was bad paddling, so we left our canoes and followed a trail through the woods for a mile and a half. It was a beautiful woody road, and we enjoyed the tramp.

At noon we lunched on the bank of the Allegash River. By this time it had grown much colder, was cloudy, and felt like snow, which fell slightly a little later in the day. The banks of the river are thickly overhung with fir trees, the current is very strong below the carry, and we had a delightful trip to Umsaskis, which we reached at 4 P. M. This lake is surrounded by higher ridges than others we had passed through, and to the writer is one of the most attractive of any seen thus far. Arbo and Libby's camps, situated on the right shore, were open, so we made our headquarters there. While the guides were preparing supper, we walked up on the ridge back of the camp. Following an old tote road not half a mile away, we jumped a buck with a splendid set of horns. Moore was a little ahead, and right in line with the animal, so we did not dare shoot, and before getting another chance his lordship plunged into the thicket and disappeared. On our way back we saw plenty of partridges.

On the morning of the ninth, each man shouldered his rifle, and by 6:30 had started to hunt; the writer saw five deer, but no large heads. Returning to camp at 2 o'clock for lunch, I sat looking out on the lake, when I spied a buck walking leisurely along the shore not far from camp. Snatching my rifle, I ran down and selected a secluded spot to watch him, and was scarcely seated when the deer jumped three feet out of water, turned, and reaching deep water, began to swim for the opposite shore. A second later, much to my surprise, a rifle shot rang out; jumping into a canoe, I paddled out to head him off. Leighton stood on the shore yelling not to shoot, as he had already sent two bullets into him, and had afterwards tracked him for a mile, the trail leading finally to the lake. We turned the buck in toward the shore, and Leighton dropped him.

He had an odd set of horns, but perfectly matched, and was a prize. When Moore returned to camp, he also had a nice buck, and had seen a moose in the water; he lost a fine opportunity for a picture, having left his camera in camp. Twenty-two deer, a moose, and a score of partridges was the day's record.

We all assumed an air of unusual dignity on the evening of this day, having gotten rid of a week's growth of whiskers. Had a good supper of venison, corn-bread, preserves, etc., and later (in celebration of the shave) indulged in cigars for a change, telling stories in the meantime, for which Leighton still wears the belt.

We were routed out at three o'clock the next morning, and at five were on the hunting grounds at the head of the lake. It was pretty dark, but the deer were out feeding among the alders all along the shore, proving the early morning to be the very best time for hunting.

Seeing no very large heads, Algie and I went ashore

and followed a tote road for three miles, finally coming to a set of deserted old lumber camps. In the yard, with just his head showing, his body being hidden behind the camp, stood a deer with a fine set of horns, but in a twinkling he was out of sight, having gotten our scent. Not ten yards further down stood a large doe, but we had meat enough.

We lunched in one of the camps, and watched for awhile, but nothing now appeared, so we started back. This place is tracked over in every direction—deer signs everywhere. Saw two deer on our way out, and shot a buck and six partridges.

The leaves at this time of year are very noisy, and the young firs along both sides of the road are so thick that once they are started, it is almost impossible to obtain a good shot at game.

We got back shortly after noon. Leighton had shot another nice buck; since morning we had seen sixteen deer. The rest of the day we took it easy. The night was clear and bright, but a little colder. We sat around the camp-fire eating our supper with such enjoyment as only those who have been there can understand.

"The glad fire cracks in the piny wood,
And the bacon fries in the pan;
The soul of the coffee in fragrant steam
Floats out of the old tin can."

The following morning we were out before five o'clock, and upon comparing notes, when we reached camp again, found we had seen nineteen deer and a moose. We were actually tired looking at game, so arranged to break camp the next day and continue on to Musquacook dead waters. We were well on our way at six o'clock. It is five miles to the foot of Umsaskis, and six more through Long Lake to quick water. At 11:30 we lunched on the shore of the Allegash once more. It was cold and raw, sweaters and gloves becoming a necessity for the first time. A good fire soon thawed us out, and lunch over, we again started, and were glad at this time to see it snowing a little, as about four inches of it would afford us great still-hunting.

It was quick water all the way to Musquacook Stream, but if the lumbermen had not picked a channel, it would have been rocky going, as the waters were getting very low, not having had rain for two months.

It is useless to undertake this trip without a guide who is thoroughly familiar with canoeing and running rapids, for when seemingly in the channel a rock suddenly looms up ahead that would tear a hole in one's canoe in short order; but by snubbing sharply with a pole, trouble is averted.

We reached Musquacook dead water at four o'clock, and camped in a sheltered spot under some tall firs. It is eight miles from dead water at the foot of Long Lake to Round Pond, and one and a half miles across the foot of the latter. This pond is great for game; the feeding grounds at the head and foot are ideal places for moose and deer; in fact, every foot of country from Mud Lake to Five Finger Brook abounds in game.

The guides proceeded to get things in readiness for the night, while the writer shouldered his rifle and followed an old tote road for a mile along the shore, and sat down where a good view of the river could be obtained. A ridge loomed up on the opposite shore, and directly at the base was a long stretch of feeding ground. I had been sitting there about fifteen minutes, when there was a loud crashing in the alders, and soon after two large bull

moose walked into view not fifty yards away. One had a splendid set of antlers, the other a fair head. It was interesting to watch them look carefully up and down the river for fully five minutes before venturing into the water. Had it been a few days later, one of the heads would have accompanied us to Boston.

After watching for ten minutes I started back to the tenting grounds, and had gone barely forty rods when a splashing in the water attracted my attention, and there, with head half hidden, stood two more moose feeding on the roots of lily-pads.

Reaching camp, we found the tents up, with nice beds of fir balsam. A roaring fire and the odor of tea and venison in the broiler, were extremely inviting. We revelled in the happiness of camp life as we gathered around the embers for supper, and enjoyed our dessert of smoke and story-telling. (Leighton still ahead.)

After dinner a visitor called who was camping just above us, and he proved to be Wilber Sutherland, who guided the writer eight years ago at Big Fish Lake. I was glad to meet him, and after talking over old times for a while, we went down with him to call on the people he was guiding—two very pleasant gentlemen from Paterson, N. J.

Seated around the fire later on, our party compared notes with the following result: Eight deer and four bull moose had been seen since morning, and two deer were in the water not a stone's throw from our camp in the early evening.

At three the next morning the guides heard two moose out in the river. This is the very best game region we have yet seen, but we concluded not to remain until after the fifteenth for a moose, so started through the dead water, a distance of three miles, then on to Allegash Falls, where we lunched.

We were lucky enough to find a team here hauling supplies for the lumbermen, and for \$2 the driver hauled all our luggage around the falls. At 4:30 we reached Twin Brook, and camped for the night, having covered twenty-two miles since morning. We saw but one deer, having passed the best game country.

All hands were tired, and after supper and a quiet smoke, we turned in early. The next morning (October 9) we breakfasted, and by five o'clock were again on our way. The weather was chilly, and the fog hung low over the river, but by eight it cleared, and the rest of the day was fine for canoeing. Coming into the St. John River, we found it very low and rocky, and had a hard time dragging our canoes. Nigger Rip rapids were the toughest proposition we had thus far encountered, but we finally pulled through after puncturing our canoes in several places. Next came Rankin rapids, and here we fairly bowled along; the waters were literally boiling, affording sufficient excitement to keep the blood tingling in our veins.

Moore's guide caught his pole under a rock, jumped over the side of the canoe, and grabbing the latter, pulled out his pole and leaped back. It was quick work, and saved them from being capsized. This shows that one must have an experienced canoeist on such a trip. At Michu rapids the water runs swiftly, but it is extremely rocky, and we got another bump, which made our canoe leak.

As one leaves the Allegash River, he is impressed with the scenery on both sides of the St. John. Great ridges rise from five to eight hundred feet, and little French settlements are scattered along the river six or seven

miles apart, each with a small clearing surrounded by dense woods. These people seem to be happy and contented; the speak good English, and are exceedingly polite, the little boys raising their hats when we addressed them.

St. Francis is the first settlement of any size; then comes Conner's just below on the Canada side, where we lunched on the banks of the river, having covered twenty miles since daylight. From here to Fort Kent the scenery is quite as attractive as at any part of our trip. More farms in the wilderness, cattle and sheep grazing on the sides of the mountains, and farmers getting in their hay that had long since been stacked, all greatly interested us.

At 4:30 we saw Fort Kent in the distance, which, by the way, is quite a busy place, and situated on the border between New Brunswick and Maine. We had paddled hard all day, covering over thirty miles, and were glad to reach a settlement once more. It was quite cold as we walked up to the hotel, and seemed more like winter.

After supper we held a consultation. Moore decided to go into Cummings' camps at Squaw Lake the next morning, and Leighton and the writer to take the morning train for Bangor, put in a day there, and go on to Boston Saturday, the 17th, thus ending one of the pleasantest trips we have yet taken in Maine.

New Brunswick has many more moose; Newfoundland

is a great caribou country, but for deer and the greatest variety of game, Maine leads them all. Here, also, one enjoys the purest air and the grandest scenery. Aside from the hunting, are the pleasures of camp life, the beauty of ever-changing foliage in early fall, and the many opportunities to become proficient with the camera.

As we journeyed homeward, light hearted and vigorous from our trip, our thoughts still dwelt on the words of the hunter-poet:

"The smoke of the camp-fire drifts away
On the breast of the wintry air,
And the heart beats light, while the mind is free
From the talons of clinging care."

G. HARRY SPERRY.

BROOKLINE, Mass.

New York Canoe Club.

Bensonhurst, L. I.

THE New York C. C. held handicap record sailing events for open and decked craft over courses in Gravesend Bay, on Saturday, July 9. Weather conditions were favorable for good sport. E. J. Wright won in the class for open canoes, and F. C. Moore in the one for decked craft. The first named boats went twice over a 1½ mile triangular course. The decked canoe did the distance three times. The summary:

July 4.

Record sailing, 17x42 decked canoes; start, 11:25; 3 miles. Postponed from July 2:

	Finish.	Elapsed.	Corrected.
F. C. Moore.....	12 03	0 37 03	0 37 03
Kenneth Rea.....	12 10 26	0 45 26	0 44 26
D. B. Goodsell.....	12 04 40	0 39 40	0 39 40

Record sailing, 16x30 open canoes; start, 11:30; 3 miles. Postponed from July 2:

	Finish.	Elapsed.	Corrected.
C. T. Speidel.....	12 15 26	0 45 26	0 44 56
B. V. R. Speidel.....	Did not finish.		
R. S. Hawthorne.....	Did not finish.		
A. M. Poole.....	12 19 28	0 49 28	0 48 58
Schoonmaker.....	Did not finish.		
C. B. Vaux.....	12 17 29	0 47 29	0 46 59
O. H. Sawyer.....	Did not finish.		
G. E. Ashby.....	Did not finish.		

July 9.

Record sailing, decked canoes; start, 3:37; 4½ miles. Course triangular, ½ mile legs; wind light, S.W.:

	Finish.	Elapsed.	Corrected.
Az 1z, 16x30, F. C. Moore.....	4 34 50	1 01 50	1 01 50
Roe, 17x42, D. B. Goodsell.....	4 41 00	1 08 00	1 08 00
Buzzard II., 17x42, Kenneth Rea.....	4 48 35	1 15 35	1 14 35

Record sailing, 16x30 open canoes; start, 3:22; 3 miles:

	Finish.	Elapsed.	Corrected.

Next record race, Saturday, July 23. J. K. HAND, Clerk.

St. Paul Letter.

ON June 30, Delta, the larger Crowninshield model, was completed, and therefore a second series of races began between her and Wihnja, the winner of the former trials. In her former races Wihnja had so greatly surpassed her opponents that there was small expectation that she would prove a loser. The original Minnetonka crew, which manned Wihnja in the former trials, had been asked to come and take charge of her again. A good heavy breeze was blowing from 12 to 15 miles an hour.

The first race began at 2:50, Delta being sailed by L. P. Ordway and Wihnja by the Louder brothers. For this race a short course of 4 knots was selected, from home to center, to Wildwood and return. The boats got off well together, and on the run to center remained side by side, Delta rounding 6s. ahead.

On the spinnaker run the boats proved about equal. Delta rounded 12s. in the lead and started off on the port tack. On the entire windward leg Delta gradually increased her lead, winning on every tack, and rounded the center buoy, 50s. ahead.

Wihnja seemed to point better, but was steadily out-footed. On the run home, as on the other runs, it was an even thing, and both boats were fairly flying along. Delta finished 47s. ahead. The time of the races was as follows:

Delta, L. P. Ordway.....	0 34 47
Wihnja, J. Londen.....	0 35 34

The second race was sailed at 3:59 over the same course. The wind had increased to 20 miles an hour, and both boats were forced to take in a reef. The judges had Delta start 8s. behind, but on the first leg she passed her opponent to windward and rounded 8s. ahead. Delta continued to gain before the wind, and was 17s. ahead at the Wildwood buoy. On the windward leg the Minnetonka boat did not do so well. Delta fairly ran away from her, and at the center buoy was leading by 1m. 28s. On the last leg she slightly increased this lead. The times were:

Delta, L. P. Ordway.....	0 27 10
Wihnja, J. Londen.....	0 28 51

After this race a storm came and the third race was postponed until 6:20. The wind had gone down to about 7m. an hour; but it freshened toward the end of the race. In this final contest the Minnetonka sailors asked Mr. C. M. Griggs to sail their boat, as they wished to get as much out of her as possible.

At center buoy Delta had a lead of 31s., and at Wildwood had increased this to 48s. On the windward leg Mr. Griggs made up about half this distance, owing to the fact that he was the first to get the advantage of a freshening breeze. On the run home Delta increased her lead by 6s., winning by 30s.

After these races the owner of Wihnja decided that there was no use in sending their boat to Oshkosh to compete in the final trials, as Delta was manifestly faster in every breeze. She was therefore shipped back to Minnetonka.

Delta will be sent to Montreal, and Alpha has been shipped to Oshkosh to compete with Sigma, the new Jones & Laborer boat, built for the syndicate. This latter boat has proved very fast, and has beaten the two fastest Oshkosh boats, Alberta and Oshkosh. If Sigma can beat Alpha as much as Delta has done, she may be sent to Lake St. Louis likewise, and the two boats, Delta and Sigma, will fight it out there.

Saturday, July 2.

The regular Saturday race afforded good sport for yachtsmen. A moderately light and very variable wind was blowing. The Class A boats, consisting of Seeress and Moccasin, started at 3:05. As usual, Seeress won, steadily gaining through the entire course.

Alpha and Delta began their struggle next. This race was of especial interest, as all wished to see how the sturdy Delta would do against Alpha in a moderate wind. Mr. Griggs sailed Delta, and Mr. Ordway sailed Alpha. The former got the advantage at the start, and at the end of the first leg to windward was leading by 1m. 30s. On the two following legs she increased her lead, and was 2m. ahead on the return to center. On the second round Delta gradually gained, winning by 4m.

At 3:15 Class B, now consisting of ten boats, started. At center buoy Robin Hood, followed by Wanderer, and Ipsilon, the new name for the Owens boat, was well in the lead. Until the second time around the three first boats remained in this order, while the rest kept changing their positions. On the windward leg to center the second time around, Robin Hood and Wanderer left the rest of the fleet far behind. At the finish Robin Hood was 1m. 18s. ahead of Wanderer, and Pluto, the third boat, followed 7m. behind Wanderer.

In the old B class, Monedo won by nearly 2m. The times were:

Seeress, Evan Rees.....	1 17 42
Mccasin, C. Fry.....	1 21 22

Syndicate Boats.

Delta, C. M. Griggs.....	1 14 20
Alpha, L. P. Ordway.....	1 13 20

Class B—New.

Robin Hood, L. Murray.....	1 23 56
Wanderer, S. Ordway.....	1 25 14
Pluto, L. Howard.....	1 32 23
Flycamaroo, Don Taylor.....	1 33 44
Circe, Theo. Schulze.....	1 34 46
Ipsilon, Dr. Owens.....	1 36 53
Rambler, Wm. Skinner.....	1 39 53

Wraith, Mr. Clarkson.....	1 43 12
Piqua, F. Daniels.....	1 43 40

Class B—Old.

Monedo, S. Shepard.....	1 31 39
Neola, Mr. Savage.....	1 33 27
Avis, Mr. Ring.....	1 38 03
Spindrift, L. Gedney.....	1 41 08

Monday, July 4.

The White Bear Y. C. had a busy day on the Fourth, for there was a morning race of 4 knots at 11 and an 8-knot race in the afternoon at 3. A good full sail breeze was blowing about 12 miles an hour in the morning, which gradually increased in the afternoon. In Class A the old and new boats mixed in one class, making the races more interesting. The contestants were Seeress, Moccasin, Alpha and Delta. The boats were well bunched on the run to center, Seeress reaching the mark first, Alpha second and Delta third.

On the windward leg Delta soon wrested the lead from Seeress, and kept ahead until the finish, when she won by 55s.

The Class B boats, old and new, had a so-called seamanship contest. They started off with a reef, and when the signal was given let it out. Again, at the signal, they took in a reef, and again let it out. The boats started off well together, but Wanderer and Robin Hood soon pulled out of the bunch. Halfway to center, Wanderer was favored with a freshening breeze, and got a good lead. She steadily increased this until the finish, when she was 4m. in the lead. The times were:

Delta, C. M. Griggs.....	0 32 45
Alpha, L. P. Ordway.....	0 34 21
Seeress, Evan Rees.....	0 53 40
Moccasin, C. Fry.....	0 37 20

Class B—Old and New.

Wanderer, J. Ordway.....	0 38 02
Robin Hood, L. Murray.....	0 42 00
Pluto, L. Howard.....	0 42 52
Avis, Ring.....	0 43 50
Flycamaroo, D. Taylor.....	0 43 04
Circe, Schulze.....	0 43 12
Young America H. Pinsky.....	0 44 27
Piqua, F. Daniels.....	0 48 35
Ipsilon, Dr. Owens.....	Did not finish.

In the afternoon Alpha, Seeress and Moccasin raced in Class A. At center, Alpha was ahead, followed closely by Seeress. She maintained this lead throughout the entire race, slightly gaining on nearly every leg, and finished 1m. 23s. ahead. Her time was the shortest made during the season. In Class B, new, Wanderer was the first to gain center buoy, with her opponents in close pursuit. She maintained her lead until the finish, ending 2m. 31s. ahead. Summary:

Alpha, L. P. Ordway.....	1 01 47
Seeress, Evan Rees.....	1 03 08
Moccasin, C. Fry.....	1 07 08

Class B—New.

Wanderer, S. Ordway.....	1 06 55
Pluto, Howard.....	1 09 26
Ipsilon, F. M. Owens.....	1 09 48
Flycamaroo, Don Taylor.....	1 11 51
Young America, Pinsky.....	1 12 22
Circe, Schulze.....	1 13 55
Robin Hood, F. F. Murray.....	1 13 59
Rambler, W. Skinner.....	1 14 45
Piqua, Forrest Daniels.....	1 22 01

Class B—Old.

Monedo, Sam Shepard.....	1 13 00
Neola, Savage.....	1 17 08
Avis, Ring.....	1 20 54

As Alpha was not officially entered with Class A boats, the races both in the morning and afternoon go to the credit of Seeress in this class against Moccasin. This gives Seeress seven straight races and the championship for the season of 1904. Seeress also won the championship last year.

Bensonhurst Y. C.

Bensonhurst, L. I.—Saturday, July 16.

THE second regatta to count on the championship of Gravesend Bay was given on the afternoon of Saturday, July 16, under the auspices of the Bensonhurst Y. C. Twenty-three craft started. The winners were Maydic, Bagheera, Bonito, Miss Judy, Beta and Martha M. Kelpie scored a sailover.

A fine S. breeze was blowing at the start, and many of the smaller boats found it advisable to reef. The wind gradually petered out, however, until just before the finish more than half of the fleet were becalmed with not more than a quarter of a mile to go to end the journey. This listless finish spoiled the race as a medium of showing the relative merits of the different contenders.

Class M and N boats had windward work from the start off Ulmer Park to the stake boat off the Atlantic Y. C. and a reach with booms to starboard on the second leg to Craven Shoal buoy. Then came a spinnaker run to Fort Hamilton mark, a reach to the Marine and Field Club and a close hauled board home. This

distance was covered twice and aggregated 10 nautical miles. The other starters went straight across the bay from the Atlantic Y. C. to Fort Hamilton. It was a run on the first. A shift of the breeze to the southward made it a reach on the second. The smaller boats covered about 8 miles.

One of the features of the race was the fine work of Maydic (ex-Umbra). She is a craft of desirable type in every way, with fine cruising accommodations, etc., and yet led the Herreshoff creations, Vivian II. and Redwing, while the breeze held steady, by a margin much greater than the time she would have had to allow them. When the wind failed, she simply walked away. There was good entry in Class Q, in which the new Hand boat, Miss Judy, beat Oggemah by only 2s. corrected time. The summaries follow:

Sloops—Class M—Start, 3:05.

	Finish.	Elapsed.	Corrected.
Maydic, W. H. Childs.....	5 07 33	2 02 33	2 02 33
Vivian II., S. E. Vernon.....	5 55 43	2 50 43	2 48 55

Boozie, C. D. Durkee.....	Did not finish.		

Southern Gulf Coast Y. A.

Waveland, Bay St. Louis, Mississippi Sound.—Saturday, July 19.

THE second event in the racing circuit of the Southern Gulf Coast Yachting Association was sailed under the auspices of the Bay-Waveland Y. C., over its 5-mile triangular (10 miles in all) course off the twin resorts of Waveland and Bay St. Louis, Miss., on July 9.

The Bay-Waveland Y. C. was well favored in a day for a yachting event, the afternoon of which, in particular, was bright and breezy—a typical sample of Mexican Gulf Coast summer weather. At the start of the races at 1 P. M. the wind was S.W., about 5 knots, and this increased to an 8 to 10-knot breeze, with a westerly shift for the second round of the course.

In the cabin sloops of 30-rating, Calypso sailed a grand race and won easily, she being too much in the kind of weather for the two old local craft. The second of the three Y. R. A., Mass., 25ft. cabin sloops purchased south this season, Marion, made her first appearance on a Gulf coast course, but she did not race. Her topsides, coaming and cabin, of bright, polished mahogany, made her appear very handsome. In the second class of cabin sloops the new local-built racer Invader showed gratifying improvement in form, the result of tuning up—smoothing up—and she sailed a much faster race than her competitor, Nydia, but she was debarred from taking the cash prize of \$60 for the class, owing to fouling the home stake. Moki, late of the Neenah (Wis.) Y. C., capsized, but she was righted in about 9m. and continued on in the race, finishing third in the class of Seawanhaka cup boats. The winner in this class, Kayoshk, sailed an excellent race, starting behind the larger vessels and going to the front and leading the fleet at the finish. There seemed to be too much wind for Virgin, ex-Caroline.

The large prizes offered for these southern races is worth noting, the purse for the Calypso class being \$80 in this event, and those of the other classes being graded downward according to size, the smallest sized craft getting \$20. The view at one of these Gulf of Mexico regattas cannot probably be surpassed in beauty anywhere; the fleet of upward of half a hundred racing boats, the many sail and power yachts and working vessels, chartered for the day, with gay parties, the crowded club house, out from the shore and brightly decorated, as are the villas along the bank, and the concourse of people lining the beach all help to make a scene of rare beauty. The summary:

Schooners.

	Elapsed.	Corrected.
Queen of the Fleet.....	2 17 41	2 14 11
Ruthie.....	2 24 28	2 23 43

Larchmont Y. C. Race Meet.

Larchmont, Long Island Sound—Saturday, July 16.

THE first of the six races, given during "race week," was held on Saturday, July 16. The wind was light from the S.W., but the day was clear and there was a good number of starters—forty-nine to be exact. During the afternoon nasty looking clouds began piling up, but they proved to be rain rather than wind clouds, and those on the different boats only suffered a wetting.

The two bronze boats met for the first time since Neola lost her mast two weeks ago in the New Rochelle Y. C. race. These boats covered a 15-mile triangle twice, making a total distance of 30 miles.

The regatta committee were on the tug Unique, and the preparatory was given at noon exactly. Ten minutes later the sixties were sent away. They crossed almost together, Neola having a slight advantage. Booms were eased off to port and jib top-sails were broken out for the reach to the first mark, 7½ miles off to the eastward. Weetamoo soon worked into the lead and showed Neola the way all around the course. Weetamoo won by 5m. 57s.

Aspirant and Effort made their appearance in the 43ft. class for the first time this season. Aspirant started in the Eastern Y. C. ocean race, but withdrew. The 43-footers were started at 12:15. Aspirant got the better of the start and led all over the course, winning by 8m. 27s. The yawls in Class M also started at 12:15. There were three boats in this class. Tern showed a rare turn of speed and romped away from her rivals, until she got so far ahead the race lost its interest. Zenobia and Memory, both rather well matched under the prevailing conditions, fought it out for second place. Memory won by over a minute. Spasm, with a new suit of Laphorne & Ratsey canvas, demonstrated what she was capable of when at her best. Her two competitors in Class M were Anotok and Mimosa III. She surprised everyone by beating Mimosa III. by minutes. Mimosa III. defeated Anotok.

In Class N, Alert had an easy time with her three contenders. Nike (ex-Oiseau) was a poor second. The 43-footers and boats in Classes M and N sailed twice over an 11-mile triangle. Boats in Class P sailed once over the 11-mile triangle. There were three starters, and all of them were built for and formerly raced in the raceabout class. Una defeated Rogue by over 3m. Snapper was last.

In Class Q Jeebi gave Gazabo a very bad beating. Skip, the other starter in this class, was the only boat that started in the race that did not finish. Phil Howard's one-design New Rochelle boat, Caper, sailed in Class R against Plover. Caper won by over 4m. Dorothy had the best of it in the Larchmont one-design class and won out by over a minute. Hourly got second prize, and Vaquero II. was third.

The raceabout class had the largest number of starters. The nine starters all got over the starting line within 25s., and at the finish less than 6m. separated the first and the last boat. Mr. Maxwell had Tomboy sailing in good trim for the first time, and she beat Tartan, her most formidable competitor, by the narrow margin of 8s. The racing in this class was of the best and never lost its keenness from start to finish.

Wa Wa, cleverly sailed by Mr. Frank Bowne Jones, won easily in the Indian Harbor one-design class. Kenoshi was second. Arizona beat Pup, the second boat, by a wide margin in the Manhasset Bay one-design class.

Three of the Bridgeport Y. C. 18ft. knockabouts sailed in one class, and Miss Modesty got first prize. Mirage was second. Scud was alone in the Hempstead Harbor one-design class and took a sailover. This was the only class that did not fill. In the Lark class Skidoo won easily. The summary:

Sloops—Class I—Start, 12:10—Course, 30 Miles.		
	Finish.	Elapsed.
Neola, G. M. Pyncheon	5 09 14	4 59 14
Weetamoo, H. F. Lippitt	5 03 17	4 53 17
Sloops—43ft. Class—Start, 12:15—Course, 22 Miles.

Yellow Jacket, G. B. Robinson, Jr.	2 46 15	2 01 15
Flirt, David Carri	2 46 35	2 01 35

Hartford Y. C. Cruising Race.

A CRUISES' race will be sailed over a special 100-mile course on July 28, 1904, wind and weather permitting. Race will be open to cruising sailing yachts enrolled in any recognized yacht club. Race will be sailed under the rules of the Y. R. A. of Long Island Sound, except as hereinafter modified, and subject to the following special conditions and instructions:

The committee reserves the right to reject any entry which, in their opinion, is not a bona fide cabin cruising yacht. Yachts with auxiliary power, otherwise coming within the terms of the race, may qualify by removing the screw propeller.

There will be two classes:

Class A, for boats over 36ft. long in over all measurement and not more than 56ft. long in over all measurement.

Class B, for boats 36ft. in over all measurement and under and not more than 25ft. long on the load water line.

Class A.—Time allowance will be given according to the Y. R. A. tables, on a distance of 100 nautical miles and based on sailing length under the present Y. R. A. measurement rule.

Class B.—There will be no time allowance in this class.

Class A.—Number and character of crew will be governed by the Y. R. A. provisions for a yacht of the 36ft. class.

Class B.—Crew limited to five men. Only one

permitted.

The starting and finishing line will be indicated by or other mark at one end, and a white burgee displayed at the race committee's boat at the other end. The committee boat will be anchored about 500 feet seaward from the seaward end of Fenwick Pier, and the mark boat about 200 feet southwesterly of the committee boat, placed so that the starting line will be at right angles to the course.

The course will be from the starting line in a generally E.S.E. direction to and around Block Island, 60 nautical miles, more or less, leaving the island on the port hand; thence in a generally W.N.W. direction to the finishing line, 40 nautical miles, more or less.

Any channel may be taken going or coming.

Starting signals will be given as follows:

Preparatory—blue peter—3 P. M., July 28, 1904.

Class A—one red ball—3:10 P. M.

Class B—one blue ball—3:15 P. M.

Each starting signal will be raised five minutes before start, and will be dropped at the expiration of the starting interval. Attention to the raising of the blue peter and lowering of starting signals will be called by gun or whistle from the committee boat.

Class A.—Twenty-five hours from and after preparatory signal.

Class B.—Twenty-seven hours from and after preparatory signal.

A boat not finishing within time limit will be considered as not having finished.

A silver cup will be given to the winner in each class, and where three or more yachts start in a class a second prize will be given, where five or more start a third prize will be given, and where eight or more, a fourth prize. All starts must be made with the bona fide intention of finishing.

Class A.—Sails permitted in 36ft. class under Y. R. A. rules.

Class B.—Only the following sails, or any of them, will be permitted: Mainsail, jib, storm-jib, trysail, forestaysail; and in case where, in the judgment of the committee, a yacht's rig is so designed that a topsail and baby jib-topsail can be effectively carried to windward in a whalesail breeze, these sails may, by special permission, be carried in addition.

No other sails than those permitted to be carried may be on board a yacht during the race.

Yachts will start in cruising trim and must have on board provisions, water, lights, anchors and other necessary cruising equipment sufficient for the purpose of a cruise of three days duration. Dinghies need not be carried, but life preservers sufficient for the crew carried must be on board.

Yachts of both classes will rendezvous in the Connecticut River at the club anchorage at 11 A. M., July 28, for inspection by the committee. All entries will be contingent upon the result of this inspection.

Owners of yachts and their Corinthian crews who may desire sleeping accommodations at the club house are requested to communicate at an early date with the chairman of the race committee. A table d'hôte dinner will be served at the club house between 6 and 9 P. M. on Wednesday, July 27, and on Friday, 29th.

A member of the race committee will stand by at the anchorage for the purpose of assigning berths and of assisting visiting yachts, between 4 and 6 P. M. on Wednesday, July 27, and 9 and 11 A. M. on Thursday, July 28.

Entries must be made out on the special blanks furnished for this race, which may be obtained of the chairman of the race committee, J. E. Stewart, P. O. Box 846, Hartford, Conn. Entries must be received by the committee at least 72 hours before the preparatory signal.

Special numbers will be provided for this race, but night signals filling the requirements of the next section must be provided by the owner of each yacht.

Yachts passing the eastern harbor of Block Island during daylight will pass close enough for their numbers to be made out from the committee boat. Yachts passing the eastern harbor of Block Island during the hours of darkness will burn a white flare light until answered by a similar light from the committee boat. Yachts of Class A will then burn a red flare light signifying their class, and raise from the deck to the full height of 7 feet and lower to the deck a white light once for each unit in their racing number.

Class B will signify during darkness exactly as in Class A, except that they will omit the red flare light.

As soon as a yacht has signalled to the committee boat her intention to show her number, every other yacht must wait until the signal has been given before signifying her intention to signal.

Hartford Y. C.

Fenwick, Long Island Sound—Saturday, July 2.

On Saturday, July 2, the Hartford Y. C. held a long distance power boat race, and there were eighteen starters. The wind was strong and the water rough. The course was from Hartford to Fenwick, a distance of 46.06 statute miles, or 40 knots. The race committee was made up of E. W. Way, F. A. Law, C. A. Goodwin, A. E. Chappell and J. McFayden. The summary follows:

	Start.	Finish.	Elapsed.
Guess, P. J. Johnson	10 06 30	5 18 30	7 12 00
Columbia, E. H. Fahy	10 55 00	5 21 45	6 26 45
Comet, F. M. Ellsworth	10 58 07	5 21 10	6 23 03
Imogene, Winter & Schmidt	11 10 23	5 28 43	6 18 20
Chic, George Farrow	11 35 17	5 28 40	5 53 23
Silver Star, H. M. Luther	11 33 58	5 45 07	6 10 09
Lox, A. D. Coffin	12 14 31	5 37 15	5 23 44
Mascot, Tomlinson & Hagenow	11 49 02	5 54 22	6 05 20
Coyote, A. B. Tucker	11 19 15	6 11 30	4 52 15
Volonel, Buckley & Davidson	12 54 50	6 28 30	5 33 40
Dot, W. C. Clark	12 32 52	6 10 03	5 37 11
Jessie F., J. F. Foster	11 12 34	6 15 10	5 02 36
River Bird, R. L. Markham	11 43 32	5 51 16	4 07 44
Caprice, Way & Reed	11 38 02	6 02 12	4 24 10
Gray & Prior	11 29 54	6 21 29	4 51 35
Buffalo, Saunders & Smith	6 15 00	9 30 00	3 15 00

Monday, July 4.

The ninth annual regatta of the Hartford Y. C. was sailed on Monday, July 4. There were fifteen starters. The wind was S.W. and strong, and the sea choppy. The sail yachts covered a 10-mile course, while the power boats covered a 9-mile course.

No time allowance was given in the 25ft. class by agreement of the owners. Procyon won and Neeche was second.

In the 21ft. class Red Jacket won, and Nez Perce won in the special class.

The race committee, J. E. Stewart, A. E. Chappell and John McFayden. The summary:

25ft. Class—Start, 2:05—Course, 10 Miles.		
	Finish.	Elapsed.
Procyon, C. A. & F. S. Goodwin	3 43 50	1 38 45
Neeche, R. H. & W. S. Shutz	3 44 18	1 39 13
Folly, H. L. Maeklein	4 04 40	1 59 35
Sigma, Gerald W. Hart	4 19 16	1 49 16
21ft. Class—Start, 2:30—Course 10 Miles.		
Red Jacket, M. A. Potter	4 14 08	1 44 08
Lobster, T. H. Smith	4 33 59	2 03 59
Special Class—Start, 2:20—Course, 10 Miles.		
Nez Perce, Chas. Templeman	4 16 30	1 56 30
Alice	4 23 43	2 03 43

Dory Class—Start, 2:25.		
	Start.	Finish.
J. B. Moore	3 08 05	0 43 05
F. R. Cooley	3 11 45	0 46 45
R. B. Buckley	Did not finish.	

Special Dory Class—Start, 2:35.		
	Start.	Finish.
Sca Gull, Philip Roberts	3 40 30	1 05 30
	3 42 10	1 07 10

Power Boats—Course 9 Miles.		
	Start.	Finish.
Caprice, Way & Reid	1 34 30	2 45 19
Lox, A. D. Coffin	1 42 15	3 03 43

Washington Park B. A.

Narragansett Bay, R. I.—July 16.

THE first of the three races for 30ft. cats for the cup offered by Commodore Peirce, of the Washington Park Boating Association, was sailed Saturday afternoon, July 16, in a stiff S.E. breeze, that made good racing. Mr. Walter D. Wood's Elizabeth again came to the front, getting the better of Mr. G. E. Darling's Mblem, which had walkovers in the last two races of the class, those for the Possner cup of the Edgewood Y. C.

Elizabeth carried full sail, while Mblem went through with a reef, and Scatt put in two reefs soon after the start. Elizabeth had a handicap of nearly 4m. at the start, owing to the putting in the reef.

Elizabeth carried away the jaws of her gaff a minute after crossing the start line and was handicapped by five or six minutes in repairing the break.

The course was a triangular one, sailed three times around, a distance of about 12 miles. This, with the S. wind, gave a broad and a close-hauled reach and a run, with no windward work. The other two races in the series are scheduled for the succeeding Saturdays. The summary, start, 2:55:

	Finish.	Elapsed.
Elizabeth, W. D. Wood	5 13 15	2 13 15
Mblem, G. E. Darling	5 20 55	2 25 55

Atlantic Y. C.

Sea Gate, L. I.—Saturday, July 16.

DESPITE conditions of the most favorable nature only three motor boats came to the line in the events of the Atlantic Y. C. on Saturday afternoon, July 16, for unusually good prizes, offered by Commodore Harrison B. Moore. At a late hour the club launch was pressed into service, making four starters in all in a race held under the rules and sanction of the American Power Boat Association. The race was in charge of Harry J. Gielow.

Nada and the club launch went once over the 10-knot course, which led from the start off Sea Gate up through the Narrows to and around the bell buoy off Robins Reef Light and return. Vingt et Un and Nokomis covered the distance twice. The former made

Rhode Island Letter.

PROVIDENCE, R. I., July 16.—The Chase Pulley Company, of this city, has just completed an unusually handsome auto-boat for its own use in demonstration, from designs by Mr. Charles F. Herreshoff, of New York. It is believed to be the first auto-boat designed entire—hull, engine, and all—by one man. The boat has been named Vision, and was designed for a speed of 24 miles an hour. The engine, built from Mr. Herreshoff's own plans, is a 40 horse-power motor, and has a number of patented improvements especially adapted for a craft of this type. It is said to weigh less per horse-power and to be more compact than any motor in the world. The propeller is a two-bladed affair about two feet in diameter, and is situated aft of the rudder. The boat has three small cockpits, with a 12ft. turtle deck forward. The stern is of the canoe model. The dimensions of Vision are: 40ft. over all, 37ft. 6in. waterline, 4ft. beam, and 8in. draft. Despite her very narrow beam, there is nothing freakish in her model, the bilges being extremely full, and the lines drawn out easily forward and aft. The freeboard is very high, especially at the bow. The boat is double-planked in mahogany, finished bright, and is an unusually handsome boat. The construction, both of hull and engine, is substantial, being designed to stand wear and tear for some years.

At the same shop an auxiliary sloop, *Buccaneer*, has just been finished for Prof. A. Laurence Lowell, of Harvard, from designs by Messrs. Burgess & Packard, of Boston. She was designed for a cruiser, but has lines that indicate a good turn of speed. The overhangs are of good length, and the counters are flat. She is fitted with an auxiliary motor of the De Dion-Bouton type, 4½ horse-power, located under the cockpit and has a sail spread of 1,130 square feet. *Buccaneer's* dimensions are: 43ft. 6in. over all, 26ft. waterline, 12ft. beam, and 2ft. 9in. draft.

The Newport 30-footers started their season this week, and three sweepstake races were sailed in Narragansett Bay. Three of the fast Herreshoff boats participated—*Carolina*, Mr. Pembroke Jones; *Raccoon*, Mr. J. R. Drexel; and *Breeze*, Mr. W. G. Roelker, Jr. In the first race, Wednesday, *Carolina*, sailed by Mr. Herman B. Duryea, won, defeating *Raccoon*, sailed by Mr. Reginald Brooks, by 32s., and *Breeze* by nearly 2m. *Breeze* won the second race, sailed Thursday, by nearly 6m., and on Friday *Carolina*, sailed by her owner, Mr. Jones, defeated *Breeze* by 26s., *Raccoon* withdrawing.

It is understood in Bristol that matters are shaped to a degree where there is no doubt that the Herreshoffs will build a new schooner-yacht for the German Emperor that will be a duplicate of *Ingomar*. The craft will be begun next December, and is to be finished in season to cross the Atlantic early in the spring. The construction material is all that is needed to begin work after the order is placed, as all the molds and patterns of *Ingomar* were preserved at the shop when that schooner was built last year.

The old Cup defender *Volunteer* was a visitor at Bristol last Wednesday evening, leaving early the following morning.

Captain L. H. Tillinghast, formerly sailing master of the schooner *Esperanza* (the original *Ingomar*), has sold his sloop *Diamond* to Thomas Dillon and son of Auburn. *Diamond* was formerly a crack racing craft, having won twenty-one first prizes and three seconds in twenty-four starts, and winning the Harvey J. Flint challenge cup for three consecutive seasons, thus securing permanent possession. *Diamond* is an old boat, but was entirely rebuilt about three years ago.

Vice-Commodore Church's sloop *Rufina*, of the Rhode Island Y. C., has been fitted with a pole-mast and new sails, in place of the tall rig and topmast heretofore carried.

The annual cruise of the Rhode Island Y. C. starts next Saturday, and the itinerary will be as follows:

Saturday, July 23—Squadron rendezvous in Newport harbor in the evening.

Sunday—Run to Stonington.

Monday—Run to Watch Hill. Dinner, dance, and fireworks at Watch Hill House in the evening.

Tuesday—Run to Shelter Island.

Wednesday—Joint regatta, Rhode Island, Shelter Island, and Sachem's Head Yacht Clubs.

Thursday—Joint run with Sachem's Head squadron to Block Island. Dance at Hygeia Hotel in evening.

Friday—Lay at Block Island. Dinner and entertainment at Hygeia Hotel in the evening.

Saturday—Run to either Newport or Bristol.

Sunday, July 31—Club bake at Potter's Cove, and end of cruise. F. H. YOUNG.

An Ocean Racer on the Ways.

PORT JEFFERSON, L. I., June 16.—The famous yacht *Vesta*, the real winner of the first great Transatlantic ocean race in 1867, is on Mather & Woods' ways, being changed from a centerboard to a keel yacht. On the ways the graceful craft shows all her fine lines, and elicits a flood of recollections from the old sea captains who have cast anchor in the port, and they exchange interesting reminiscences of her.

"David Carll built her in 1866," one leads off, "at City Island for one of the Lorillards—Pierre, I think—and she was, I suppose, the best built and best appointed yacht in commission up to that time. There had been a deal of chaffing of yachtsmen as 'fair weather sailors' by deep sea skippers, and in 1866 the owners of the *Vesta* and of another crack yacht, the *Fleetwing*, arranged for an ocean race between the two yachts from Sandy Hook to the Needles, and in the dead of winter, to show the sea-going qualities of the vessels and their crews. James Gordon Bennett owned a yacht, the *Henrietta*, that he thought could whip anything afloat, and he persuaded the two principals to let her come in at \$30,000 a side, the winner to take all.

"Those were the flush times just after the war, and there were thousands of men in New York, and, in fact, the country over, with money to burn, consequently betting on the three little game-cocks when the race was announced was something fearful to see. The very audacity of the thing tickled the popular fancy, and there never was an event in sporting circles that aroused such widespread interest and enthusiasm as did this. The *Herald* fanned the flame with columns of stuff—it was

a great advertisement for that paper—and the other journals followed suit. My ship was lying in New York at the time, and I well remember the excitement the day the racers sailed. Each had been overhauled in the most thorough manner; every man in the crew was picked, and to further stimulate his zeal was promised a certain percentage of the stakes if his boat won—enough to make him comfortable for life. It was a cold, raw January day, with the wind nor'west and blowing half a gale that heeled the yachts over until you could see the green copper on their bottoms. Very few ever expected to hear of their safe arrival on the other side. In fact, bets were offered and accepted as freely on their never making land as on the winning boat. I should really like to know how much money was staked on both propositions.

"Well, sir, from the day they disappeared into the cold gray haze of the ocean off Sandy Hook until they made land on the other side—sixteen days—not a word of the racers came out of the deep; nor did they sight each other; yet all raised the Needles within about two hours of one another. Storm after storm beset them on the voyage, and as their captains held on every stitch of canvas they could carry, they were half under water most of the time. The *Henrietta* lost several men, and the *Fleetwing* one, but the *Vesta* never parted a rope yarn. The *Vesta* actually sighted land first, but through an error of her navigator she made it too far to the eastward, and had to beat back twelve miles, which gave the race and the \$90,000 to the *Fleetwing*."

The later history of the *Vesta* is interesting. After many vicissitudes she was purchased by the Rev. Father Dougherty, of the Catholic Protectory, in New York, as a school ship for his boys. But the project was abandoned after a time, and he sold the *Vesta* to Major Frederick Ackerman, of the Atlantic Y. C., who had her rebuilt at Hawkins' yard in Port Jefferson. During his ownership she has won several of the Atlantic Y. C. races. This season she has been changed to a keel boat, as before remarked, and thoroughly overhauled and refitted, and has been leased to Mr. Shillito, of Cincinnati, Ohio.

YACHTING NEWS NOTES.

For advertising relating to this department see pages ii and iii.

SALES.—Mr. Henry A. Bishop, N. Y. Y. C., has chartered the auxiliary schooner *Planet* from Dr. A. L. Ranney, of this city, through the agency of Stanley M. Seaman, New York. The same agency has also sold the speed launch *Reliance* for C. Oliver Iselin, Esq., to Mr. A. C. Stratford, Jersey City, N. J. Dr. Stephen Peabody, New Haven, Conn., has purchased the cruising catboat *Hobo*.

COMBINED FLEETS OF SEAWANHAKA AND PHILADELPHIA CORINTHIAN Y. C.'S TO CRUISE.—On Saturday, July 30, and Sunday, July 31, 1904, the fleet of the Philadelphia Corinthian Y. C. are to be the guests of the Seawanhaka Corinthian Y. C. at Oyster Bay. A reception will be held on the flagship *Aloha* on Saturday afternoon, followed by a dance at the club house in the evening. On Sunday divine service will be held on the flagship at 11 A. M. The flag officers of the Philadelphia Corinthian Y. C. and the Seawanhaka Corinthian Y. C. have arranged that the S. C. Y. C. boats accompany their fleet from Oyster Bay eastward for a few days.

POWER YACHT ZORAYDA SOLD.—Mr. W. Ryerson Kismam, Bay Shore, N. Y., has sold his 60ft. power yacht *Zorayda* to Mr. E. Barnett, of New York city, through the agency of Stanley M. Seaman, New York. The same agency has also sold for Mr. W. N. Bavie, New Rochelle Y. C., his knockabout *Knave* to Mr. E. Hope Norton, of New York city.

CHEWINK III. REACHES NEW ORLEANS.—The Massachusetts Y. R. A. restricted 25ft. class cabin sloop *Chewink III.* arrived on the Morgan Line steamer at New Orleans Thursday, July 15. Her new owners are very much pleased with her appearance. She will sail her first race in the South at Biloxi, Miss., Saturday, July 23.

BRITISH SCHOONER ELMINA ARRIVES.—The British schooner *Elmina* arrived at New York on July 12, fourteen days out from San Juan. She is owned by Mr. William Exshaw, and she flies the flag of the Royal Thames Y. C. *Elmina* left England last February, and since that time has been cruising in the Mediterranean and the West Indies.

HARTFORD Y. C. RACES.—Three special races will be sailed over the Hartford Y. C. courses at Fenwick, Conn., on July 23, August 20, and September 3, respectively. The preparatory signal will be given at 2 P. M., wind and weather permitting. The races will be sailed under the rules of the Y. R. A. of Long Island Sound. They will be open to yachts enrolled in any recognized yacht club. Entries must be made in writing by the owner or his representative at least forty-eight hours before each race to J. E. Stewart, chairman race committee, P. O. Box 846, Hartford, Conn. Prizes are offered in the following classes where one or more boats start in a class: Sloops, 36, 30, 25, 21 and 18 foot racing length; Seawanhaka knockabouts; special class; one-design classes.

Yachting Fixtures for 1904.

Members of race committees, and secretaries, will confer a favor by sending notice of errors or omissions in the following list, and also changes which may be made in the future.

JULY.

20. Larchmont, race week, Larchmont.
20. Eastern, cruise to Islesboro.
21. Larchmont, race week, Larchmont.
21. Eastern, cruise to Bass Harbor.
22. Larchmont, race week, Larchmont.
22. Eastern, cruise to Bar Harbor.
23. Corinthian, club race, Marblehead.
23. Larchmont, race week ends, Larchmont.
23. Hartford, L. I. Sound Y. R. A., special, Fenwick.
23. Manhasset Bay, power boats, Manhasset Bay.
25. Eastern, regatta at Bar Harbor.
27. Boston, Mass. Y. R. A., Hull.
28. Boston, midsummer series, M. Y. R. A., Hull.
29. Quincy, Mass. Y. R. A., Hull.
30. Boston, midsummer series, M. Y. R. A., Hull.
30. Indian Harbor, L. I. Sound Y. R. A., annual, Greenwich.
30. Atlantic, power boats, Sea Gate.
30. Eastern, power boats, Marblehead.

Rifle Range and Gallery.

The Palma Trophy.

THE Council of the National Rifle Association of Great Britain met at Bisley on Tuesday of last week and formulated a reply to the recent letter of the National Rifle Association of America, dealing with the return of the Palma trophy, as follows:

"Bisley Camp, July 12, 1904.

"Sirs—I am directed by my Council to acknowledge the receipt of your letter of June 18 and report the safe arrival of the Palma trophy. I am further instructed to say that they accept the resolution passed at the meeting of your executive committee, which accompanied your letter, as a generous admission that the rifles used by the American team did not conform with the conditions of the match, and that by returning the trophy, it is their intention that the match of 1903 should be regarded as null and void.

"It is a matter of regret for my Council that the rifles in question were not officially submitted, in accordance with his instructions, by the captain of the American team to the captains of the other competing teams at their meeting previous to the match, a view of the material difference which is now known to exist between the rifles used by the American team and those issued to United States troops it would not have been possible under the conditions of the match for the former to have been allowed to be used in the competition, and thus the unfortunate discussion which has since taken place would have been avoided.

"My Council having in previous correspondence disavowed any wish to reverse the result of the match, or claim the trophy, are consequently unable to accept it as accredited winners for 1903, but they are prepared to act as its custodians provisionally and pending any future arrangements which may be made in connection with another match.

"I am to inform you that the Council of the National Rifle Association are unanimously in accord with the American committee as to the importance, in the interest of international rifle shooting, of terminating the correspondence regarding this controversy as speedily as possible.

"I am desired to point out that one medallion of the trophy is deficient. This will doubtless follow.

(Signed) "C. R. CROSSE, "Lieut-Col., Sec'y National Rifle Assn."

It will be noticed that, in courteous but clear terms, the Council coolly takes for granted that the American team violated the conditions of the match at Bisley last year, notwithstanding that the National Rifle Association of America placed itself on record by resolution at its recent meeting as ratifying all the statements made by General Spencer in a letter of March 7, 1904, to the N. R. A. of Great Britain, wherein he, in substance, held that the rifles in question were service rifles.

In the "Report of the National Rifle Association of America" for 1903, there is a reprint (page 54) of an article taken from the "Volunteer Service Gazette," of England, and credited to "The well-known English rifle expert, Mr. R. L. Tipples." From it we take the following excerpt:

"The contest is popularly supposed to show which are the best rifles and the best men. In some senses it does; but not so completely and clearly as the general public supposes.

"Although fired with the 'national arm of each country,' the specifications were not in all particulars strictly followed. The British shot strictly with rifles inspected and passed by a Government viewer, as in all respects identical with the Government-made rifles. They used exactly the weapons and appliances always allowed at Bisley for Service rifle competitions. The rifling was absolutely identical with Government pattern. The Americans used a rifle which in action and general construction is of Government pattern, but in the really vital matter of the rifling is of entirely different construction. It is not the Krag-Jorgensen barrel, but a special Stevens-Pope barrel."

By the publication of the foregoing in its report for 1903 without any demur, it would seem as if the N. R. A. of A. had given it their official approval.

Ladies Shooting for Charity.

ONE of the great attractions of the Victoria Hospital Charity Bazaar, at the Royal Albert Hall, London, the other day, was the miniature Bisley, conducted by Messrs. Walter Winans and H. Claude Hay, and which proved not only a great attraction but a distinct success, and the interest exhibited in the shooting was far greater by the ladies than by the men, and their average scores much better. The givers of prizes were Messrs. Winans and Hay, the Union Metallic Cartridge Co., and the Winchester Repeating Arms Co.

At the close of the shooting on Thursday afternoon it was found that four ladies had tied for the first prize, the diamond and sapphire bracelet, with scores of 23 each out of a possible 25. The shooting of these ties was witnessed with great interest, and eventually the first prize went to Mrs. Strachey; the second, a diamond brooch, to Miss S. Graham; the third, a diamond lace pin, to Mrs. Henry Tatc, and the fourth, a miniature rifle to Miss Parsbury.

In addition to the above, excellent scores were made by the Countess of Scarborough, the Countess of Coventry, Lady C. Stewart Richardson, Lady Barbara Smith, Lady Mabel Smith, Lady Barrington, Lady Oranmore and Browne, Lady Sophie Scott, the Hon. Cicely Drummond, the Hon. D. Sturt, and many other ladies.

Taking into consideration that the position in the shooting was standing, the above scores must be considered most excellent.

Mr. Walter Winans was indefatigable in his exertions to promote the shooting, and his coaching and assistance was greatly appreciated by a large number of ladies, who probably would not have shot if it had not been for his encouragement.

Trapshooting.

If you want your shoot to be announced here send a notice like the following:

Fixtures.

- July 20-21.—Charlottesville, Va.—University of Virginia Gun Club tournament.
- July 20-21.—Ann Arbor, Mich.—Tournament of the Eastern Michigan Gun Club; \$100 added. E. W. Sutton, Sec'y.
- July 21.—Rockville, Conn.—Fourth Consolidated Gun Club of Connecticut tournament. F. Elliott Metcalf, Sec'y.
- July 25.—Olney, Ill.—Gun Club tournament.
- July 26-29.—Mexico, Tex.—Gun Club tournament.
- July 27.—Norwich, Conn.—Shooting Club target tournament. I. P. Taft, Sec'y.
- July 27.—Sandusky, O.—Gun Club tournament.
- July 27-28.—Avon, N. Y.—Gun Club tournament. Jay Greene, Sec'y.
- July 27-28.—Grand Forks, N. D.—The Interstate Association's tournament, under the auspices of the Grand Forks Gun Club. W. M. Ferguson, Sec'y.
- July 28.—Richmond, Mo.—Missouri League of Trapshooters.
- July 29-30.—Newport, R. I.—Aquidneck Gun Club two-day tournament. J. S. Coggeshall, Sec'y.
- July 30.—Chicago, Ill.—Gun Club tournament.
- Aug. 2-5.—Love Point, Md.—Malone's summer tournament; targets and live birds and added money. Capt. James R. Malone, Mgr., 2671 Pennsylvania avenue, Baltimore.
- Aug. 9-10.—Litchfield, Ill.—Consolidated Trapshooters' Congress.
- Aug. 9-10.—Raleigh, N. C.—North Carolina Trapshooters' Association tournament.
- Aug. 9-10.—Birmingham, Ala.—Alabama tournament.
- Aug. 9-12.—West Baden, Ind.—Indian tournament; \$1,000 added money.
- Aug. 10-11.—Allentown, Pa.—Two-day target tournament at Duck Farm Hotel. C. F. Kramlich, Mgr.
- Aug. 10-11.—Rolling Fork, Miss.—Gun Club tournament.
- *Aug. 10-11.—Bradenville, Pa.—Rod and Gun Club.
- Aug. 10-12.—Little Rock, Ark.—Arkansas State Sportsmen's Association tournament. Paul R. Litzke, Sec'y.
- Aug. 11-12.—Olean, N. Y.—Gun Club two-day tournament. B. D. Nobles, Sec'y.
- Aug. 10-12.—Brantford, Ont.—Dominion of Canada Trapshooting and Game Protective Association's fourth annual tournament. A. B. Cutcliffe, Sec'y.

Messrs. Sears and Sanders were visitors.

W. P. T. S. L. at Scottdale.

SCOTSDALE, Pa., July 15.—The shoot of the Western Pennsylvania Trapsshooters' League and the Westmoreland County League was held at Scottdale, Pa., July 13 and 14, on the grounds of the Scottdale, Pa., Gun Club.

This club was favored with the best of weather, as both days were ideal ones for shooting. The jack rabbit system of divisions of money was used, and met with general approval.

The summer vacations of a good many shooters was accountable for the slim attendance. The trade was represented by Messrs. L. J. Squier, E. D. Fulford, H. C. Watson and H. P. Fessenden.

High average first day went to E. D. Fulford, with 168 out of 175; second, A. B. Kelly, of Scottdale, Pa., with 164; third, J. F. Calhoun, of McKeesport, Pa., with 162; and fourth, L. J. Squier, with 160.

High average second day was also made by E. D. Fulford, with 168 out of 175; second, L. J. Squier, with 166; third, R. S. Deniker, of Ruffsdales, Pa., with 161; and fourth, R. R. Rahn, of Pittsburgh, Pa., with 156.

General average resulted as follows: E. D. Fulford, first, with 336 out of 350; second, L. J. Squier, with 326; third, A. B. Kelly, with 319, and fourth, R. S. Deniker, with 307.

The Westmoreland county, Pa., team race brought out three teams of five men each, and resulted in a tie between Derry and Ligonier, each getting 208 out of 250 shot at, and Scottdale finishing with 200 breaks.

Poughkeepsie Gun Club.

POUGHKEEPSIE, N. Y., July 7.—After several weeks' intermission, during which time the club house, traps and other equipment have been moved and new grounds been put in shape, this club began shooting again to-day, this being the regular monthly club shoot. We now have grounds easy of access, and which for background and other advantages are hard to equal. In addition to the magatrap, we are putting in a rapid-fire trap, and are using circular platforms built to standard regulations. If, in case it is necessary to put in more traps to handle a big tournament, we have plenty of room to do it. The grounds can be reached from central part of city within five minutes by two trolley lines, and are but a minute's walk from either line at Grand avenue junction. Strangers coming to our future shoots will have no trouble in finding grounds, as landing direct to grounds, and all conductors know where to let you off.

The scores made to-day, with exception of Traver's in cup event, were not of a very high order, owing, perhaps to strange grounds, and lack of practice.

The contest for the Peters shells was a better race than that for the cup, as scores will show. We shoot every Thursday, and visiting sportsmen are cordially welcomed.

Peters contest:
Du Bois won shoot off.

July 14.—A series of contests for a medal that must be won five times to own, was begun to-day. The medal, which is a beautiful one, was presented to the club by Mrs. Condit, widow of the late Max Condit, who for years was captain of this club. After shooting off a tie with Smith, Winans won the medal to-day. In the merchandise event Marshall and Winans tied on full scores, and upon tossing a coin, Marshall chose heads and was the lucky man.

The boys were agreeably surprised to-day when Smith and Sisson appeared on the grounds with gun and shells. Pat has been taking a rest for a couple of months, while Sisson shot to-day for the first time in several years; his work, considering, was fairly good, too. Traver and Hans will attend the shoot of the Cincinnati Gun Club next week.

Shot at.		Broke.		Shot at.		Broke.

Ohio Trap.

Cincinnati Gun Club.

CINCINNATI, O.—The attendance on July 16 was larger than usual, many coming out to get a try at the traps before the tournament. The day was hot, and the shade of the veranda was very acceptable to the boys when not at the traps.

The grounds have taken on their tournament array. Tents dot the lawn, and the fences and buildings are decorated with the cards and advertising matter of the gun and ammunition houses. Nothing was lacking but the crowd, and that will be here next week. For the first time in several weeks R. Trimble was present, and was one of the high men, acquiring the high average habit, as he was top man at Sistersville W. Va., on July 14, missing only 7 targets out of 200.

The contest in the cash prize series was postponed, and in its place a 50-target race was shot, in addition to practice events. Ahlers, Trimble and See tied for first on 46. The scores: Ahlers 46, R. Trimble 46, See 46, Peters 44, Falk 42, Maynard 42, Pfeiffer 41, King 41, Roll 41, J. A. Steinman 40, Stickels 40, Medico 40, Bercau 40, Williams 39, Herman 37, Gambell 36, J. C. Steinman 35, Jack 35, Lindsley 33, Davies 31, Hobart 30, Joe H. 28, Smith 27, Andrews 13.

The Hamilton (O.) Gun Club held its ninth trophy shoot of the season on July 14. Ten members took part. Wesley was high, with 43. Other scores were: Parker 41, Atherton 41, Stickels 39, Shumaker 39, E. D. C. 39, Smith 38, Link 35, Mrs. Ayres 35, Steinman 29. At the conclusion of the trophy match a team race was shot at 25 targets per man, resulting in a victory for the Atherton team by a score of 98 to 91. Atherton 21, Link 20, Mrs. Ayres 19, Jones 19, Smith 19; total, 98. Stickels 21, Shumaker 19, Wesley 18, Steinman 17, Parker 16; total, 91.

The Springfield (O.) Gun Club held its regular shoot on July 9, the attendance being about the average. In addition to the two medal events, 50 targets were shot at in events of 25, 15 and

Henry 22, Eshelman 20, Gicker 20, Barr 20, Matz 21, Essick 22, Miles 19, Melcher 18, George 19, Wilson 11, Shultz 19, Dietrich 21. Shoot-off for badge, 25 targets: Gerhart 21, Walter 24, Henry 19, Essick 19, Dietrich 23.

Auburn, Pa., July 15.—The Mill Gunning Club again defeated the Auburn Gunning Club in the second monthly shoot. Each man shot at 15 targets. Scores:

Mill team—Morrison 15, P. Sowers 9, Miller 9, Sowers 7, Moyer 13, Swartz 8, Wildermuth 11, G. Fleisher 11; total 83. Auburn Gunning Club—J. Moyer 8, H. Mellon 5, Geisenheimer 15, C. Sowers 8, D. Sowers 7, W. Staller 8, Fred Sowers 8, D. Berger 9; total 68.

Wilkes-Barre, Pa., July 9.—The Wilkes-Barre Lace Weavers' Club to-day defeated the Ashley Gun Club in a target match by a score of 88 to 78, but they lost the live-bird match by a score of 11 to 10. The contestants were to shoot at 10 birds each, but the consignments of pigeons failed to reach here, and only three birds each could be had. The scores in the clay target match were:

Ashley—Wallace 16, Rummage 7, West 11, Evans 17, Smith 9, Conrad 4, Miller 14; total 78.

Lace Weavers' Club—J. Neimeyer 13, Johnson 19, Moore 12, Willard 7, W. Neimeyer 11, Sheekard 10, Dolan 16; total 88. DUSTER.

IN NEW JERSEY.

Fairview Gun Club.

FAIRVIEW, N. J., July 4.—The scores made at the shoot of the Fairview Gun Club to-day, are appended:

Events:	1	2	3	4	5	6	7	8	9	10	11
Targets:	25	25	25	25	25	25	25	25	25	25	25
Dods	19
F Butler	21	19	23	21

THE MANAGEMENT AND STAFF—G. A. H. AT INDIANAPOLIS, 1904.

10 each. Watkins was high man for the day with 87 out of 100, and also won the Wilson trophy with a score of 24. Henderson won the Young handicap trophy after shooting off a tie on 22 with Strong.

The tournament of the Toledo Consolidated Gun Club, held on July 10, was attended by shooters from several other cities, among them Columbus, Findlay, Fayette, Oakharbor, Sylvania and Genoa. The weather was fine, and some good scores were made. Valk, of Toledo, was high gun with 147 out of 160; Buchanan, of Columbus, second, with 145; Lang, of Findlay, third, with 142, and Madison, of Oakharbor, fourth, with 141.

The Rohrer's Island Gun Club, of Dayton, held a barbecue picnic and an all-day shoot on July 13. The weather was perfect, and a large crowd attended. Not an unpleasant incident marred the pleasure of the occasion. The committee of arrangements consisted of J. Schaerf, President; W. E. Kettle, Secretary; Joe Hohm, Treasurer; C. F. Miller, P. Hanauer and Chas. Smyth, and to these gentlemen is due the praise for the perfect manner in which all details were carried out and for the success of the affair. It was a day of fine sport from the time the first target was thrown at 9 A. M. until the sun disappeared behind the Soldiers' Home hill. The wives and children also enjoyed the day. A plentiful and substantial lunch was served free to everybody all day. The medal event had a record entry of twenty-six and of these fifteen qualified by breaking 25 or better.

The tie was shot off in classes, Lindemuth, Dr. Arthur and Buttlr withdrawing. Sirran, Cook, G. Donohue, Sigrist and Wentz, having the same handicap, shot off at 14 targets each. All tied on 10 and shot off, miss and out, Cook breaking 4 and remaining in, the others dropped out. Achey, Hohm and Oswald shot off at 12 targets each, Hohm dropped out and Oswald and Achey shot off, miss and out, Oswald breaking 3 and staying in. Lockwood, Miller, J. W. and Engle shot off at 10 targets each, Engle dropping out. Lockwood, Miller, Oswald, J. W. and Cook then shot off the final at 5 targets each. Cook and J. W. broke 2 and 4 respectively and dropped out, the others tied on straight scores. Again they shot at 5 each, and all broke straight. Then came the finish, miss and out, Lockwood winning with 5, Oswald and Miller 4 each. This was the most hotly contested shoot in the history of the club.

Trap Around Reading.

POTTSVILLE, Pa., July 8.—A live-pigeon shooting match was held here between Harry Showers and William Boehmer, prominent local wing shots. The men shot at 9 birds each for \$100 a side. Showers won, grassing 4 birds to his opponent's 3.

Pottsville, Pa., July 7.—On the grounds of the Pottsville Game and Fish Protective Association, this afternoon there was a shooting tournament at which 1,500 targets were used.

In a 100-bird event, Prothonotary Samuel Gore defeated Lamar Lawrence by a score of 71 to 70.

At 85 targets: Clyde G. Allan broke 64; John Raring 57, William Beck 54, Ed Dow 53, and George Charles 42.

Carlisle, Pa., July 9.—The Carlisle Gun Club held their shoot this afternoon at the grounds. The attendance was small. James Porter, of this city, won the club medal shoot. Messrs. Appar and Squier, two trades representatives, were the guests of the Carlisle Gun Club members.

Reading, Pa., July 16.—The South End Gun Club held its regular monthly shoot to-day, on the grounds on Boyer's Island, opposite side of the river below the Bingaman street bridge.

It was the ninth of a series of twelve shoots for the gold medal, which was won by Walter for the second time. He tied with Gerhart, Henry, Essick and Dietrich on 21, and in the shoot-off at 25 targets broke 24 and won. Frank Gerhart has also won the medal twice, and several other members have a single claim to it. There are still three shoots, and the contest is exciting.

The scores were as follows:
Badge shoot, 25 targets: Gerhart 22, Ball 20, Walter 22, Yost 21,

At Other Places.

At Kalamazoo, Mich., Saturday last, Fred Keefe won the first of the series for the Hunter Arms Co. medal. Weekly shoots will

When Jack Fanning was last heard from he was "fanning"

himself in Little Rock, Ark., and incidentally smashing a few targets with the gun club.

A gun club was organized last week at Alvin, Tex., and L. B. Carson was chosen president, with T. C. Edwards secretary.

The last shoot held by the Billingham, Wash., Gun Club was well attended. There were over twenty-five members present. In a team shoot, the home team won over Vancouver, B. C., by just one target.

The Mallory family were in it at the last Ohio Valley shoot. Roy won the handicap on a straight 25, while J. F. won high general average.

A Wisconsin enthusiast, calling attention to the various traveling men who will be in attendance at their tournament, says all the men mentioned can shoot for hours without missing a shot.

An up-to-date gun club was started last week at Shelbyville, Tenn. The officers elected were: R. Sandusky, President; L. Pressgrove, Vice-President; Jas. C. Tine, Secretary. The ministers of the town were all elected honorary members.

Dr. Gropper, one of the best trapshoots of Milwaukee, Wis., is laid up with a broken ankle, caused by a fall.

The McLean County Rod and Gun Club, Bloomington, Ill., held their weekly shoot last Tuesday. Many new members have been added and shooting will be on the increase in the vicinity of Bloomington.

At the regular shoot at Owensboro, Ky., T. R. Morton won the medal for the second time. Rain spoiled the attendance. At 50 targets, Morton, with a handicap, was straight. Brown 48, Lewis 44, Renton 43.

Last Friday afternoon, when the Adrian, Mich., boys were out T. Metakas shot at 50 targets, scored 4. He says that next time they will be all broken, as he will use a six-barrel shotgun.

There will be something doing in the shooting world at Salt Lake. Drs. M. R. Stewart and J. M. Dart have started to organize and push a gun club. All the first class appointments will be placed on the shooting grounds.

During a shoot held last week at Great Bend, Kans., Mr. Paxton won the cup permanently, yet he very generously donated it to the club. These generous sportsmen are the ones who keep the game going.

Jim Skelly stopped in Kansas City on his way to Denver, and he and Dr. Planck tied up in a 100-target race with 94. Other scores were: Stone 93, Leavel 90, Forest 88, D. Elliott 86, Erhart 84, Vaugh 82.

Paducah, Ky., Gun Club boys are getting busy on their fall shoot. There will be two shoots combined, that of the Kentucky State and the gun club. They will, however, be held on different days. There will be a new money plan adopted.

When Elmer E. Shaner lands at Grand Forks, N. D., for the Interstate tournament he will find Hale, Cooper, Ferguson, Dreis, Wells, Parker, Seymour, all true blue sports. They are noted for cordial and generous entertainment of all who are guests of their gun club.

Des Moines, Ia., has hopes of regaining its former prestige as a shooting center. It is just the place for the State tournament. Watch 'em next year.

Way out in Aberdeen, S. D., the trapshoots are not idle. A match between said city and Bath showed Aberdeen two to the good. Several sweeps were shot on Saturday, with varying results.

Tom Lang, Findlay, O., crack shot, was a participant at the Cincinnati tournament held this week. Possibly he did not shoot a borrowed gun.

When the Crawfordville, Ind., Club held their holiday shoot, the honor for high score went to A. Thomas, of Linden.

Another old-time gun club has been resurrected. This time it is Huntsville, Mo. A merchandise shoot with some fifty prizes was held last week and proved a success.

Warrenton, Mo., Gun Club shot a match last week with the St. Charles Club and won by the small margin of two targets. A return match will be held at Warrenton in the near future.

In the Southern States the Fourth of July is not celebrated with the same spirit that is shown by the Northern people; hence there is no interference on the general celebration line with the holding of tournaments. Hence it becomes a pleasant privilege to write up the successful shoot held at Memphis, Tenn., July 4. The attractions offered, such as \$500 in cash and trophies galore, calls forth the Mississippi Valley shooters as well as a mingling with them of many of the traveling men. The sun shines warm in this part of the country, so that when Billy Crosby found that there was an umbrella offered for high average, he tried to win same, and in so doing put up the score of his life. Shooting three days, 200 each day, score 195, 197 and 199. Then Chas. Spencer and Jack Fanning had a merry race for second, Jack landing by just one "little saucer." This was not accomplished with good weather conditions, as an unpleasant rainy day was experienced on the first day. Yet shooting did not stop for same. The two following days were fair ones, and the shooting was accordingly good. The feature of the first day was the team shoot between Memphis and Shreveport, or a picked five men from that locality. Shooting at 100 targets each, Memphis won easily with 19 to the good, thus. For Memphis: Frank 95, Poston 97, Brady 92, Joiner 83, Canale 85; total 452. Shreveport: Bosley 95, Skannal 92, Mercer 91, Bryan 84, Brazeale 71; total 433. On the second day the Scimitor cup race and the last 500 of the team race furnished excitement in plenty. Fletcher won a most sensational race after tying with Mercer, the Shreveport crack, on 98 out of the 100. They both made 24 out of 25 in the first shoot-off, but on the second Mercer fell to 22, and the Birmingham great amateur carried away the cup amid much excitement. Hundreds of the townspeople came out to witness the results of the team race, and the unexpected happened, as with a starter of 19 to the good, the home team was badly beaten. All the Memphis team fell down, while the Louisianians held up regularly. Scores: Shreveport—Bosley 92, Skannal 90, Mercer 89, Bryan 82, Brazeale 87; total 440. Memphis—Frank 89, Poston 89, Brady 79, Canale 77, Joiner 73; total 408. With lovely warm weather, the last day was ushered in, and the shooting was good. High amateur average fell to the steady shot, P. C. Ward, with a total of 560 to Fletcher's 557, Mercer 553, Frank 549; for each of which there was a prize.

ONLY twenty-five shooters faced the trap at the National Gun Club tournament when Lilly said, "All ready; let her go," and half of these were traveling men. The attendance should be a lesson to all who manage shoots, inasmuch as the selection of dates following immediately after another shoot, is the greatest mistake that can be made. In this case there had been two weeks' previous shooting, all the surrounding States had held State shoots, and the shooters had spent two weeks from their homes and business and the attractions of even Mr. Lilly's and Tom Taggart's \$500 did not draw the shooters. There are many shooters who do not care to pay \$3 per day for hotel, nor do they wish to carry Tuxedo coats with them and go on dress parade each evening. To these let me suggest that there are boarding houses and hotels in plenty that make \$1, \$1.50 and \$2 rates. You can shoot, enjoy the water, breathe the pure air, climb the mountains, just the same as though you put up at the French Lick hostelry. No

doubt many do not understand this, and this is written with a view of putting all the amateurs on to the hotel accommodations and surroundings so that there may be no hesitancy on part of all who may desire to attend the Indian shoot, as the chances for cheap living are just the same at West Baden.

Watson Park Gun Club.

WATSON'S PARK, Chicago, July 9.—Shogren and Barto made high score in the first event with 24 each. Young made high score in the second event with 15. Shogren made high score in the third event with 23 at the 19yd. mark.

The 25s in the first event won a point in the handicap. The first column contains the scores actually made; the second the targets missed, and a like number to be shot at as a handicap; the third, the number broke of handicap, and one to be added for every 3 missed.

Event 2 was at 15 targets, high guns.

Event 3 was a distance handicap at 25 targets:

Events:	1	2	3
Shogren	24	1	25
Barto	24	1	25
Hanagan	22	4	11
Young	17	10	25

Mr. Schroeder was a visitor.

Garfield Gun Club.

CHICAGO, July 16.—The appended scores were made on our grounds to-day on the occasion of the fifth trophy shoot of the second series. Thomas won Class A trophy on 24; Keck won Class B on 20. No Class C shooters present. In the cup shoot, which followed, Thomas, Dr. Shaw and Hathaway tied for Class A trophy on 22, and in the shoot-off at 5 pairs, Hathaway won by going straight.

The day was hot and windy, and the shooting was difficult and very few good scores were made. The attendance was just about our regular average of thirty shooters. Two applications for membership were received, bringing our waiting list up to ten.

Cup shoot:

DR. J. W. MEEK.

W. P. T. S. L. at Kane.

KANE, Pa., July 9.—The Western Pennsylvania Trapshooters' League shoot at Kane, Pa., July 6 and 7 was quite a success, barring the fact that the attendance was not up to expectation, as only thirty-one shooters faced the trape on the first day and thirty-two on the second day.

Shooters were present from Pittsburg, Du Bois, Sheffield, Mt. Alto, St. Mary's, and Blairsville, Pa.; also Olean, N. Y.

High average for the first day went to L. J. Squier, breaking 171 out of 175; second, Mr. Chas. Irwin, of Pittsburg, Pa., with 165; third, Mr. E. D. Fulford, with 163, and fourth, Mr. A. Sizer, of Kane, with 161.

High average for the second day was a tie between Mr. L. J. Squier and Mr. E. D. Fulford, each getting 167 out of 175; second, Mr. B. D. Nobles, of Olean, N. Y., with 160; third, a tie on 159 between Mr. Irwin, of Pittsburg, Pa.; Mr. Sizer, of Kane, Pa.; Mr. Garland, of Blairsville, Pa.; Mr. Hart, of Buffalo, N. Y., and Mr. Millen, of Du Bois, Pa.; and fourth, Mr. Brown, of Kane, Pa., with 158.

General average for the shoot resulted as follows: Mr. L. J. Squier first, with 338 out of 350; second, Mr. E. D. Fulford, with 330; third, Mr. Chas. Irwin, with 323, and fourth, Mr. A. Sizer, with 320.

A continuous run was made of 118 by Mr. L. J. Squier; Mr. L. B. Fleming a run of 71, and Mr. Sizer a run of 56.

The trade was represented by L. J. Squier, E. D. Fulford, H. C. Watson and H. B. Fessenden.

The race for the Kane Sporting Goods Co. cup was decided on the second day. This event calls for 25 targets a man, four men to a team, and was won by the Kane, Pa., team with a score of 92 out of 100. Du Bois, Pa., team was second with 90, and Sheffield, Pa., team third with 85.

Meyer	10
Hess

The 25s won point on handicap.

Johnson was high gun in first event with 25 straight. Geo. Eck was high gun in second event with 25 straight. Johnson was high gun in third event, with 25 straight.

It was a perfectly still day, just suitable for big scores, and there were plenty of them. Johnson made two straight scores of 25, and Geo. Eck made one 25.

SHOTGUN.

SIDE LIGHTS OF TRADE

At the W. P. T. S. League tournament at Kane, Pa., July 6-7, Mr. Chas. Irwin, of Pittsburg, Pa., won the amateur average for the two days, using a Winchester gun and shells.

New Advertisements.

The new automatic trap, for throwing artificial targets in numbers, just brought out by the Tribune Trap and Target Co., of Erie, Pa., has an active interest for every trapshooter in the land. The Tribune Trap throws targets at any and all angles; throws targets fast, slow and at any elevation, and never clogs. From the cuts and descriptions that we have seen of it, it appears to be a marvel of mechanical skill. The booklet published by the company is ready for distribution, and will be sent on at request.

Pond's Extract has long been a household word, and is perhaps the most universally employed of any remedy in the United States. It is useful for all bruises and exterior hurts, and nothing takes out the soreness from over-exerted muscles quicker than a good rubbing with Pond's Extract. This is an especially useful thing to know by men who, starting out in the shooting season with their muscles soft from disuse, work hard for several days, held up by the excitement of the sport, and then give out from over-exertion.

BAKER GUNS SHOOT HARD

and are SAFE.

They are noted for this wherever known, and that is almost everywhere. Ask the man who owns one.

Fine Trap and Medium Field Grades, \$25.00 to \$200.00 and up.

THE WILD DUCK SUPPLY.

FOR a long time the State and Federal Governments have been taking a hand in the propagation and distribution of fish, and in recent years some efforts have been made to rear and distribute game, but this last is an operation much slower and more difficult than fish propagation. Yet no one can tell what may come of experiments in this direction, and such experiments should be encouraged, since money spent to increase our game or fish supply is well spent.

The State can purchase deer or pheasants and turn them out in parks and preserve them from injury by gunners, but it cannot be sure that they will not be killed by the winter or by vermin or suffer from a thousand other ills. On the other hand the examples of the Yellowstone Park, the Austin Corbin Park, and many other properly guarded preserves show that where game is protected from outside attacks, there is every prospect of success.

There is a growing tendency now in the various States to set aside reserves where wild creatures shall be protected. Massachusetts has established several such preserves; so have California, Michigan, Minnesota, New York, Pennsylvania, Wisconsin, and Wyoming. Two or three other States have reserves devoted to forestry or to other uses, but they are small. Canada has set apart a great number of timber reserves similar in many respects to our United States forest reserves, and while on these reserves the killing of wild things is to some extent limited, there is, we believe, no such absolute protection as is found in the United States Yellowstone Park or other national parks of this country.

It would undoubtedly be a wise action for each one of the United States to set aside within its borders some area, greater or less, which would at all times be protected. If such tracts were put in the charge of a game keeper, were protected by statute, and were reasonably looked after in the matter of providing food and shelter in winter, there is no doubt that each one of them would before long become a center from which might flow out a never ceasing supply of game.

About fifty years ago something of this kind was attempted by private enterprise on the borders of Chautauqua Lake, the largest of the inland waters of western New York. At that time and earlier, Mr. Geo. Irwin, a nature lover residing near Mayville, N. Y., made a systematic effort, extending first and last over thirty years, to domesticate several species of wild duck. Chautauqua Lake was at that time frequented by a multitude of ducks, among which were all those which still occur on the shores of Lake Erie; several species of geese and swans also visited it, and many other sorts of waterfowl bred along its shores, which were then clothed with deep forests of beech, poplar, and chestnut.

For the purpose of attempting the domestication of as many of these sorts of birds as could conveniently be obtained, a small area of about an acre, situated at the very edge of the lake, was selected as a breeding ground. The choice was made with special reference to the vegetation growing within the inclosure, which should furnish alike food and shelter. Sheds and nesting places of different sorts were put up within the inclosure, and the first birds put into it were young ducks, caught alive, or just hatched from eggs taken from the wild birds' nests.

Of the species experimented with, the mallard, dusky duck, and blue-winged teal were the most abundant; but pintails and swans also bred in the inclosure, migrating south in the autumn, but returning in spring to take up their homes here to breed again, and again to make their southward journey. While a considerable number of the birds reared here were allowed freedom, migrated, and returned again to breed again, others were captured, transferred to a barnyard, and kept in captivity, finally developing into domestic fowls which could hardly be known as having wild origin. The species which took most easily to domestication were the mallard, the dusky duck, and the Canada goose. Mr. Irwin was especially successful in rearing wood ducks, and his account of the habits of the bird is very interesting. These experiments were brought to an end by the building of a branch railroad through the place where they were being conducted, and so far as we know they have never been resumed.

Their apparent success, however, suggests what might be done in a State reserve, or what might be done by individual effort on almost any body of water, provided the

land owners about it would agree to protect it during the season of breeding. We understand that something of this sort is taking place in Jefferson county, New York, where for a number of years now there has been no shooting of the birds in spring. It would be interesting to learn to-day whether black ducks and blue-winged teal are breeding this year on Long Island as they certainly have bred in past years.

Few occupations, we think, could be more interesting or attractive, for one who has the time to devote to it, than breeding our native wildfowl in domestication. This can be done, and has been done, and requires little more than a breeding stock, and thereafter reasonable attention to protect the young birds from vermin. The late Fred Mather was at different times and places successful in this matter; a resident of Long Island, and an eminent artist of Boston have also bred wildfowl on a large scale. A number of zoological gardens have regularly reared fowl, and only this summer broods of young Canada geese, mallards, dusky ducks, and other wild species were to be seen in the Gardens of the New York Zoological Society of this city.

There is abundant reason to think, therefore, that systematic and faithful effort by Government officials in the way of rearing wildfowl would be rewarded by abundant success, and we are disposed to think that it is by efforts in this direction on State reserves that the increase in our wildfowl so eloquently pleaded for a few weeks ago by Mr. Sydney Fisher may be hoped for.

If the spring shooting of wildfowl should generally be abandoned throughout North America, and reservations should be established where the birds might breed in safety, long steps would have been taken toward the renewing of the old time abundance of wildfowl which most of us have thought was gone forever.

AN OPPORTUNITY FOR PHILANTHROPY.

RATIONAL recreation is a cure-all for numerous ills of life, physical, mental, and moral. Body, brain and spirit require it. If deprived of it, they balk, break down, or develop in some irrational direction. As a social organization, a community, we are coming to recognize this more clearly, and to give expression to our recognition of it by providing more frequent holidays, more public parks, more children's playgrounds, and various other means of diversion. Every such opportunity for harmless recreation of the young makes for good citizenship. The State can well afford to pay increased attention to providing means of healthy outdoor sport for the boys of to-day who are to be the citizens of to-morrow.

A seriously complicated problem, and one which is ever with us in the large cities, is what to do with our young men on Sunday. It is a problem which is restricted for its solution to the actual conditions as they exist, not to any theoretical assumption of what might be or ought to be. An incessant conflict is waged between the young people who want to play ball and other people who demand that Sabbath quiet shall not be broken by ball games. The ball players are frequently taken into court in prosecutions set on foot usually by representatives of the churches. Such a case came up in Brooklyn the past week, when, on complaint of the pastor of a Methodist-Episcopal church, a number of boys were arrested for having played baseball on Sunday in the vicinity of the church. The defendants were discharged by city magistrate James G. Tighe, who drew a distinction between public sports and pastimes, and held that the defendants were not liable under the code, inasmuch as they had been playing simply for the sake of the game, and not for any revenue from gate receipts. The magistrate said:

If the American boy is offered a proper outlet for his pent-up and surplus energy, he can be trusted to respect and obey the law in his youth, and manhood will find him a good, law-abiding citizen. In my thirty years' experience in criminal law, I have found the playing of harmless games on Sundays by our boys and young men conduces to good order, and that repose of the community in the highest degree, and this has been the experience of our police captains in charge of the precincts within whose bounds these games are played. Corner loafing has within those precincts ceased to exist, and without some vent of this description, all the mischievous and vicious tendencies of young men and boys would be called into active play, and as a result we would have rioting, disorder and all kinds of drunkenness and gambling, and I know by reports that those conditions do not exist in the precincts wherein these play grounds are situated, and I believe it would be a good thing for the city to establish, under police control, public playgrounds where sports and pastimes of this kind could be indulged in.

Such a statement from such authority is deserving of very serious attention and very careful consideration.

The town itself offers no place suitable for baseball on Sunday. The game is boisterously noisy, and the courts to the contrary notwithstanding, is nothing short of a public nuisance. The dweller in the town is entitled to his Sabbath quiet and repose in the fullest measure attainable; and it is an imposition and often an outrage to subject a neighborhood to the uproar of a Sunday game of baseball. There are numerous available sites readily accessible from every large city where the game might be played without so imposing upon other people who prefer the day of rest without the hullabaloo of the ball ground.

Now that the country is well supplied with library buildings, some practical philanthropist might wisely provide in the suburbs of the large cities recreation fields for the free use of the boys of the town, under necessary restrictions which might readily be framed.

SQUIRREL BARKING.

THE discussion of the squirrel question has collected enough barked limbs to supply a camp-fire. The evidence adduced to demonstrate the possibility of barking is conclusive, and we may consider the question settled.

The abundance of the testimony to squirrel barking by correspondents who have done the feat themselves, or who know others who have done it, may be a surprise to some who, while not skeptical about the practice of barking in the old days, have been wont to regard it as a part of the art of shooting that had long since passed out of vogue. To bark a squirrel requires an exactness of aim and a steadiness of holding which are nowadays not so commonly developed as they were under the conditions which once existed, when the man of the woods had to know how to shoot, and to shoot well, or go hungry. The necessities of the time and the extended actual practice of shooting for subsistence, developed a degree of skill among the frontier shooters for meat which your modern marksman may well envy but rarely hope to attain for himself. And as we become less expert ourselves, the less credulous are we of the stories of what the men of an earlier day could do with their old-fashioned arms. The fine art of rifle shooting—that is to say, actual shooting at game in the woods—has sadly deteriorated since the times of Boone and Crockett. The game itself has gone. The substitution of the repeater for the single shot has made the shooter less careful and even reckless in delivering his shot, and the old opportunities of the men in the woods who had "all the time there was" to hunt the game with deliberation and sure shooting, are very different from those of the average big-game hunter of to-day, who, even in the woods, cannot wholly free himself from the dominating spirit of hurry and impatience so characteristic of our modern social system.

The cut of Davy Crockett's rifle illustrates a typical arm of precision of a squirrel-barking generation. The old arm was sent to us some years ago for exhibition, and afterward was shown in the FOREST AND STREAM's exhibit at the World's Fair. The rifle at that time belonged to Col. "Bob" Crockett, a grandson of the hero of the Alamo; by him it was bequeathed to John W. Crockett, Secretary of State of Arkansas, who has placed it on exhibition in his office in the State Capitol. The rifle was originally a flint-lock, with a 46-inch barrel, afterwards reduced to 40½ inches. It takes thirty-two balls to the pound. It was made at a cost of \$250 by Constable, a famous maker of his time. The rifle was presented to Crockett soon after his second election to Congress in 1829 by some of his admiring Whig friends of Philadelphia. In the top of the octagonal barrel, in letters of gold, is the inscription: "Presented by the Young Men of Philadelphia to the Hon. David Crockett, of Tennessee." In smaller letters, near the muzzle, are Crockett's famous words, "Go ahead."

THAT is not an altogether pleasing picture of the American angler which Mr. Bastedo gives us in his explanation of why the Ontario authorities have found it necessary to put a license upon the visitor who fishes in St. Lawrence River waters. Heretofore angling in that territory has been free. It was a freedom which has been abused, and for the new restrictions the fishermen have no one to blame but themselves.

THE SPORTSMAN TOURIST

A Summer in Newfoundland.—VI.

(Continued from page 67)

FAT venison we wanted, wanted it badly. Good, juicy ribs, and steaks, and marrow bones are wonderfully appetizing after a diet of salmon, and the possibility that the game might carry but mediocre antlers, never occurred to me—nor did I care whether it did or not. The breeze was light but favorable, and just by the bank of the inlet was a choice spot for watching. Nothing, however, appeared for two hours but clouds of black flies, and never have I felt them more wicked and all-pervading than during the first hour of that evening at Andrew's Pond. We had retired a few yards back from the water, to boil a kettle of tea and rest for the night, when a splash away up shore caused William hastily to smother a newly lighted fire, while I ran down to the pond. He was coming quickly, an old white-necked stag, well antlered, splashing along at a rapid trot. He had reached the opposite side of the outlet almost before I had time to press a couple of caps down over the nipples; but the distance was too great for the rickety old gun, and we wanted those fat quarters badly.

Boldly wading in, the water soon reached his withers, and a moment later the stag stood knee deep on my side of the stream. He stood motionless, gazing intently into the bushes, for already the scent of smoke had reached his nostrils. Two discharges in quick succession; the cheap black powder roared like a cannon and dense clouds of smoke almost concealed the caribou, as the latter reeled backward into deeper water. "You hit un," yelled William, and together we rushed out on the sand spit, only to see our stag floundering about in four feet of icy water. He seemed paralyzed and struggled helplessly and aimlessly around in circles. The wound was evidently mortal, and he would probably die in a few minutes; but load again we must and put him out of misery as speedily as possible. Accordingly, I handed William the gun and ramrod for the purpose of recharging, as he was more familiar with muzzleloaders and knew just how much powder the well-worn barrels would stand. In doing so, however, the screw was unfortunately broken from the end of the ramrod with two or three inches of wood; but at the time this seemed merely a trivial mishap, as the animal appeared to be weakening fast and about to give up. William rammed vigorously for seconds before returning the piece, and then, placing a cap on the left nipple, whispered, "Shoot dat un first." So I walked out knee-deep into the stream and, taking aim at the stag not ten yards away, pulled the trigger—and only the cap snapped. Another and another were tried with the same result. Even a few grains of powder placed in the touch-hole as primer brought no response.

Something was wrong, and the load must be drawn. So hastily taking off my coat, I drew out the safety pin which fastened my money in its inside pocket, bent it, tore a strip from my flannel shirt, and spent fully ten minutes in lashing it securely to the end of the rod, and drawing both loads. But imagine my utter astonishment and chagrin when twenty-four harmless buckshot—two full loads—rolled from the left barrel, while a good handful of coarse-grained powder fell from the right. Fully twelve minutes had elapsed since firing the first shot, and all this time my stag had been floundering helplessly in the water, the blood visibly trickling from six or seven small bullet holes a little high in the shoulder. But he was slowly reviving with a truly wonderful recuperative power, and now stood in the shallows on the opposite side, still in easy range but only ten feet from the thickest alder tangle that ever bordered a stream. One barrel was hastily reloaded, and just as he entered the bushes I took a good true sight on his side, pulled the trigger, and the gun "blew" or hung fire, the charge passing completely astern.

It was too late. Darkness had fallen and a thick night fog hung heavy over the bushes. I did not reproach the guide for his unexcusable carelessness in loading the gun, for he was already on the verge of breaking down. Rain fell heavily all night long and, soaked to the skin, we sat and shivered in silence.

Well, we never saw that stag again; but the pity of it all was, that the great beast lay dead somewhere back among the spruces, and now his bones are bleaching white and his flesh has become the prey of bears and foxes. That was a sad experience; probably no hunter ever recorded one more harrowing or more truly exasperating in all its details, and I relate it with great reluctance, as it is not a tale which a sportsman would care to exploit before the public. But the blunder serves a purpose and teaches a lesson.

No animal is dead, merely because it has fallen to the crack of the rifle, and experience has often proved that the wise hunter is the man who hurries forward for a finishing shot. Of course, when tracking in the snow this rule is not so imperative, for then even a slightly wounded animal may be followed with ease; but when the woods are wet and leaves are on the trees a blood trail is very difficult to follow. Especially is this true should the game be wounded by a mushroom bullet

from a small caliber rifle, which, although powerful enough, frequently lacks in its projectile sufficient weight, and consequently loses greatly in momentum and striking energy.

A .30-30 is a very deadly weapon if well handled; but within my experience, at least, its bullets have rarely penetrated competently through the body of an animal as large as a caribou. The single hole of entry is small, very small, often clotting with blood within an hour, and then the trail ceases. For this reason, many of the old New Brunswick woodsmen, among them such notable characters as Henry Braithwaite and William Carson, of Boiestown, are reluctant to enter the woods with a man who carries a .30-30. Carson told me last September that during the season of 1901, five bull moose, all wounded with the above named rifle, escaped to die in the woods, and his party came out without a head.

Some years ago a friend of mine took a long shot at a buck, standing on the shore of Beaver Pond in the Adirondacks. The latter was fully 200 yards away and collapsed in a heap at the report of the .38 Winchester. "You broke his back, all right," remarked the guide; but, fortunately, we put all steam on the paddles and, before reaching the spot, our buck was again on his feet waiting for a second shot. Later, when skinning the animal, but one bullet hole could be found, and it was some time, and only after a very careful examination, that the mystery of the first shot was finally explained. The lead never even cut the skin, but had merely stunned the deer by striking the base of one antler an inch or two above the skull; and it is safe to say that, had we not plied the paddles vigorously, my friend would have lost the fine head which now adorns his study wall. A Brooklyn physician whom I met in Newfoundland related a less successful experience with a bull moose back upon the headwaters of the Little Southwest Miramichi in New Brunswick. He had wounded the bull severely with two bullets from a high power rifle, and as the great brute stood broadside at one hundred yards, brought him down with a third well-directed shot. The doctor left his moose crashing around among the bushes, apparently in the last throes of death, and returned to camp for ax and skinning knife. Half an hour later the bull had departed for parts unknown, and was never seen again.

No, no animal is dead until it has ceased to breathe, and it is as imprudent as it is illogical to proceed on any other assumption.

The effect of bullet wounds on big game of such great vitality and strength as bear or moose is also a subject of much general misapprehension among laymen. A vital spot must be reached, and when it is, death or helplessness is sure to result. No one at any distance—except, perhaps, an expert—would be foolish enough to aim at the head or spine of an animal, although a bullet in either of these places would result in immediate and total collapse. Never but once have I seen a caribou drop without stepping out of his foot-prints, and that was two years ago, when a young friend who accompanied me to Newfoundland aimed at the shoulder and struck the brain of a stag at seventy yards with a .30-40 Winchester. The tyro usually aims at the very center of the animal, or else at the horns, and plants his bullet, if at all, through the latter's stomach or intestines, which is about as good as a miss. Directly back of the shoulder and low down, or head on in the chest, or quartering through the body so that the lungs are reached, are all vital spots, and a sure, speedy death. Great care should be exercised when shooting for the shoulder not to aim too high, as such a wound merely results in a temporary paralysis, similar to that which affected the stag at Andrew's Pond. To completely disable an animal is just as certain as a mortal wound, but less humane; and both shoulders or hips broken, although rarely occurring, are sure shots. Occasionally, in the case of moose and deer, but quite frequently with the clumsy, thick-set caribou, a leg broken well up becomes a disabling shot, especially if the animal be an old and heavy stag. Last year I shattered the thigh of a large stag with a .303 Savage expanding bullet, and the animal never moved ten yards after the bone was broken; had it been a white-tailed deer he might have escaped. At the time I was surprised at the caribou's apparent inability to leave the spot, and remarked the same to my guide, Robert Stroud, a man who has shot "deer" ever since he could carry a gun, and he replied that it was not infrequent in the case of a leg broken well up. During the great midwinter hunt of the Newfoundlanders, when thousands of the animals are killed for their meat, Stroud always does his share of the work on the open plains back of Alexander Bay, and he has had ample opportunity to follow up hundreds of wounded animals. Sad it is, that the fishermen are so poorly equipped with modern firearms; their heavy muzzleloaders are charged with nails, slugs, and buckshot, indiscriminately, and when a volley is fired into a herd of fleeing caribou, only a comparative few of the wounded animals fall at the first discharge.

To brand all hunting whatever as cruel and degenerate, is of course, as Theodore Roosevelt aptly remarks, "merely a bit of unhealthy sentimentalism;" but as long as game is to be killed, it is the hunter's duty to aim straight, and be sure of a vital spot; and after all has

been said, the surest place, if fairly exposed, is low down back of the fore-shoulder. We sportsmen want dead animals quickly killed and not maimed or wounded ones dying by themselves days or weeks after being hurt, for the game resources of this land, or any land, are not sufficient to warrant inaccurate, careless shooting, and poor crippled creatures struggling off into the woods to die. A slight wound is worse than a clear miss; and no man has any business in the woods with a rifle in his hands who cannot place his shots within a ten-inch circle at, at least, a hundred yards.

Perhaps less depends on the particular make or style of a rifle than upon the man behind it; but, nevertheless, any gun ever made is none too good, none too accurate or powerful, and a choice should be given careful consideration. During the last half century wonderful progress has been made in the development of the military and sporting rifle. In no field of modern industry have the brains of industry and the trained skill of the artisan been applied more effectively than to implements of war. The quaint picturesqueness of such characters as Daniel Boone and Davy Crockett would be strangely marred if they were pictured armed with a rifle of to-day; and old Leatherstocking's simple mind would be sadly perturbed at the passing of the buckskin pouch, the powder-horn, and "la longue carbine" of the early *courriers du bois*—those quaint, stalwart figures of our early history. Yes, the long-barreled, muzzleloading smooth-bore has truly become a relic of the past; but from it have been evolved weapons of wonderful accuracy at long range, and terrific shocking power. Each new year produces its latest patents and improvements, and almost within the year a weapon has been placed upon the market that will shoot in quick succession five 300-grain soft-nosed bullets at an individual muzzle velocity of over 2,000 foot seconds, with a striking energy of about 3,500 foot pounds.

For nearly ten years articles have appeared in our sporting magazines which, if collected, would fill dozens of volumes, all bearing upon the relative merits of large vs. small caliber high power rifles for hunting purposes; but still the discussion continues, in some localities as vehemently as ever, and still it will continue just so long as success is achieved by the advocates of either weapon. We constantly hear the opinion of the man who has shot a few deer or a couple of moose with a .30-30 or .303, but he is in no better position to decide the controversy than many men who have done the same with a .45. A .22 caliber has been known to kill a deer, and will do it again, while a .50 smooth-bore is as deadly on rabbits as it is on bear. Only men of long and wide experience in the woods, or better still, a well compiled comparative table of authentic data citing thousands of instances, are competent to decide the most effective caliber and load under all conditions. No one would think of shooting prongbuck at great distances on the plains with the heavy, slow-flying ball of an elephant gun; nor would a sportsman of any experience expect to use a double-barreled express rifle on the white goats or bighorn of the Rocky Mountains. On the other hand, our small bore, flat trajectory rifles of to-day would prove, and have proved, inadequate and unserviceable for the big game of India or Africa. They are not adapted to close range shooting in the jungles, where great momentum and terrific shocking power are essential, and they never were intended for such work. But after all has been said, there can truly be no "very best rifle"—one which is superior to any other on all animals under all conditions; and the man who boldly proclaims his .30-30 or another who heralds his .45-90 as "the best gun on the market," must be men either of very narrow practical experience, or very shallow mental depth.

I was glad to leave Andrew's Pond, and so was William glad of a chance to forget any lurking memories of that sandy beach by the inlet, and the long rainy night which followed our experience with the stag. So early next morning we pushed on toward an unnamed lake, some ten miles to the eastward, which, by courtesy, I will call Sand Pond.

It has been said of General Sheridan that once, when passing through the dry, arid regions of Texas, he made this remark: "If I owned hell and Texas, I would sell Texas and live in hell." Evidently the general had never traveled the Newfoundland interior during fly-time, for if he had held a fee simple of the barren ground between Andrew's and Sand Ponds, he might have thrown it in along with Texas, and paid a few dollars to boot. Stretching out before us lay over a hundred square miles of the most desolate, wibegone country that God ever created; endless marshes soaked with water, and naked hills seamed and scarred by winter's ice. Little clumps of stunted, half-starved spruces gleaned a meagre sustenance from the scanty soil. The climate seemed as mild as that of Maine, but vegetation and flora were of the sub-arctic zone. The sun blazing down burned as readily as on Cape Cod, but a few patches of crusted snow still filled the deeper fissures of the highlands. A terrible winter would soon hold those vast wastes in its icy grasp. "Tucks" were everywhere, and anyone who has never traveled through them has yet in store an experience equally demoralizing upon clothes and temper. Just imagine yourself tramping over a ridge covered with short, crisp moss. It is like a velvet carpet, and a good three-

mile gait rapidly lessens the distance to camp. Suddenly the texture of the carpet changes, and its color from a light gray to a beautiful dark green hue. You step on it, innocently enough, and immediately sink to your waist in a dense tangle of scrubby spruce. You cannot pass through it, you cannot walk on top; and unless a friendly "deer" lead lends its assistance, a long detour will be necessary. Then you are in the "tucks."

I once missed a fine chance at a bear all due to these infernal "tucks." He was on a huckleberry barren near "Ole Christoph's" Pond, sleek and black, wholly unconscious of my presence. Half a mile away across the valley I watched him through the glasses for some time, slowly slouching along, busily engaged with the berries, and occasionally overturning a stone in search for the succulent ants that lurked beneath. The wind was favorable, and the bear was gradually working his way in a circle to a point where a successful stalk could be made. So pumping a cartridge into the chamber I prepared for a long crawl over the moss. A hundred yards went well, but then, alas! a hundred rods of impenetrable spruce growth stretched out ahead, and the best chance of a summer was lost. That bear still roots with satisfaction among the ant hills, and safely roams the country back of Christoph's Pond, but no safer is he than when I stood upon the edge of the tucks and watched his fine black pelt disappear over the ridge on the other side.

The sun stood, by this time, high in the heavens, a good time for a rest, and an excellent opportunity for boiling the kettle. So while William cut down a supply of wood for the fire, I brought out an old envelope and jotted down some notes on the birds observed during the last few days.

Bird life throughout the interior is just as different from that near the coast as are the species found at the coast different from our well-known friends of the Middle States. The nature and topography of the inland country are not favorable to the sustenance of many species, but the few which do occur may be counted upon with some degree of frequency and regularity. Crows, ravens, thrushes, and foxsparrows, were seen very infrequently, while no terns were recorded at all. On the other hand, horned larks (*Otocoris alpestris*), and pipits (*Anthus pensilvanicus*), ptarmigan (*Lagopus lagopus allemi*), and Canada geese (*Branta canadensis*) were abundant on the barrens, while nearly every pond sheltered its brood of sheldrakes (*Merganser americanus*), and a pair of loons (*Gavia imber*) or herring gulls (*Larus argentatus smithsonianus*). The latter were just commencing to depart for the ocean, and had already diminished considerably in numbers since our arrival at the falls. Every patch of forest contained its full quota of titmice, nuthatches, and jays of both species, although *Perisoreus canadensis* appeared to be the much more abundant of the two. Great horned owls (*Bubo virginianus*) were observed on several occasions silently flapping over the wet marshes; bald eagles twice, and once I saw a single individual of those rare nomadic wanderers, the Bohemian waxwings (*Ampelis garrulus*). I tried my best to secure a specimen of the horned owl of Newfoundland for purposes of identification, as the birds seemed quite dark in coloration, approaching more closely *B. v. saturatus* of Labrador and the north than *B. virginianus* of eastern United States and lower Canada, but Jim's old seal gun, loaded with buckshot, made but a poor substitute for a collecting gun, and all my efforts were futile.

Sand Pond, nestling in a valley among surrounding hills, one end a bog, the other shrouded in sombre forest gloom, is a typical pond of the Newfoundland interior. Already many does and small deer had left the protecting thickets and could be seen wandering about over the barrens above the lake; but old stags, tardy as usual, were still scarce on the open country. At that time they should be sought around low swamps and heavily wooded river bottoms, and great precaution should be exercised in pitching a camp. No fire was lit that first night at Sand Pond, as the fresh sign along shore showed that we were in the heart of an excellent stag country. It was rather cold, and perhaps we were foolish, but anyone who has hunted caribou before they have commenced to travel will thoroughly understand the reason of our extraordinary care. The man who goes to Grand Lake or Kitty's Brook after September 10 can live in luxury in a permanent home camp and at night enjoy the warmth of the largest fire, for then the deer have commenced to move from place to place, and one that was ten miles away at sunrise might well, toward evening, almost stumble upon the tent. Previous to that time, however, sportsmen can permit themselves no such luxurious comforts, for then the caribou are living quiet and seclusive in their summer home, and then a heavy stag rarely travels half a mile from his bed. Absolute silence, small fire, infrequent chopping, and, above all, no unnecessary tramping the country, are all cardinal rules to be followed; and the man who hunts little and looks much is the one who will prove fortunate. The man who has finished his breakfast before daylight will be more successful than the one who tumbles out of his sleeping bag at six o'clock; and the guide who rests during the midday heat and then watches long after sundown is a wiser hunter than the one who searches industriously all day long and then returns to camp to finish his supper by daylight. The old maxim, "Early and late are the times to wait," was never truer than when hunting "deer" in the early autumn. Such hunting is the acme of sportsmanship, and demands in a high degree the trained skill and quiet, stealthy tread of the still-hunter.

It is difficult to understand just why the unfortunate misnomers "stag" and "deer" have been applied to the caribou by the Newfoundlanders. A caribou bull is an animal totally different in every respect from the stag of the Scotch Highlands or the historic Rot Hirsch of the forests of Germany. But a certain reluctance to invent new names for new animals has always characterized colonists in a strange land, and it is evident that the early Scotch and English settlers in Newfoundland were no exception to the usual rule. To them the caribou has always been a deer, and a deer it will always remain. Our own early pioneers were just as reluctant and conservative in their choice, selecting names for American game totally inappropriate and often scientifically inaccurate as well. Thus they christened our wapiti, which is closely allied to the European stag, elk, a name as mis-

leading as it is incorrect, for the true elk is the prototype of the American moose throughout the boreal forests of the eastern hemisphere, and it represents an entirely different genus from the wapiti. The Indian cougar was ignored for the more familiar and conservative mountain lion; yet the great cat is distinctively an animal of the new world. Our beautiful redbreasted thrush became known to the settlers under the same name as the diminutive European robin, while in localities our ruffed grouse became a pheasant. The white-tailed deer was called red deer, after its English cousin; the extraordinary antelope of the West became a white goat; the prong-buck of the plains for a hundred years has posed as an antelope; while the grand old bison of the past indigenous to American soil, an animal which was born and bred and then died on our western prairies, has passed into history as the buffalo.

Sad indeed it is that a European nomenclature has been saddled upon American animals. But we still retain a few names thoroughly western in their origin and significance, and such words as moose, coyote, and maskinongé, carcajou, musquash, ouananiche, and caribou, will stand as perpetual monuments to the aboriginal Indian long after the latter has vanished from the broad land that was once his own.

Early next morning William and I sat by a little barren at the foot of the pond, waiting for the sun to rise. A thick white mist hung heavy on the water, and an all-pervading icy dampness penetrated to the very marrow. Over on the opposite shore a solitary doe was dimly discernible through the fog, and a few moments later her well grown fawn emerging from the bushes, frisked and frolicked by her side. Across the outlet, not fifty yards from where we sat, was a beaver house, or, more properly speaking, a beaver hole, at the mouth of which a great heap of brush had been piled by the industrious animal. There he lived a lonely life in solitary confinement, apart from all friends and neighbors of his race; for search, as later we did, no other beavers were discovered at Sand Pond. For half an hour nothing worthy of a shot appeared on the beach; so moving back a few hundred yards, we took our stand on a little eminence, from the summit of which a view of the surrounding country could be obtained. The mist was gradually dissipated by the sun's bright rays, and soon broad, well-worn deer leads could be seen stretching out, crossing each other in every direction. It must have been about six o'clock when William suddenly gripped my arm like a vise, and pointing across the barrens whispered, "Look! Dere's a stag over yonder." I followed the direction of his finger, and sure enough, far down along the slope, a caribou was slowly clambering up the trail which turned off only one hundred yards from the base of our knoll. Yes, he was coming, slowly but surely, up the lead. Now I can plainly see the shaggy white neck and broad palmations of his antlers. He stops a moment to crop a mouth full of moss from beside the runway, and stands erect watching the doe and fawn across the pond. Perhaps she once belonged to his harem and still remembers those fierce battles and hoarse challenges of the previous autumn. Proudly tossing his head, he quickens his pace to a fast walk. Now I can see the vapor from his nostrils rising like a white cloud in the frosty air. Nearer and nearer, wholly unconscious of our presence; I draw the sights on his broad gray chest; a quick flash; a loud report, and the stag crouches, trembling in every fibre, but then rushes onward with headlong bounds. The rifle cracks again, and he totters, stumbles, and falls in a heap. We rush down the hill with all possible dispatch, but it is unnecessary, for before us on the moss he lies dead upon his side, truly the noblest, the proudest creature of the northern wilderness.

What a strangely powerful instinct it must be that drives the hunter to commit such a deed! Yet here we are, William and I, exchanging mutual congratulations and shaking hands over the prostrate form of the quarry.

WILLIAM ARTHUR BABSON.

[TO BE CONTINUED.]

On the Amazon.

UNITED STATES CONSUL AYME writes from Para, Brazil, of conditions obtaining on the Amazon: "The reports of my immediate predecessor in office were of such a nature as to inspire the belief that there existed many opportunities for the investment, by Americans, of moderate amounts of capital in various lines. I despair of finding language strong enough to express the utter and absolute hopelessness of success that awaits any of them unhappy enough to attempt to make even a bare living on the banks of the mighty Amazon. The Amazon River may be divided into three parts: The lower Amazon, extending as far as Manaos, where the Rio Negro flows into it, a distance of about 900 miles; the upper Amazon, from Manaos to Iquitos, near the Peruvian boundary, a distance of perhaps 1,800 miles, and the Peruvian Amazon region, with navigable rivers for a distance of 1,600 miles and more. This amazing river system, which empties into the Atlantic, through a series of mouths 180 miles wide, more than twice as much water as the Mississippi carries in flood, and which stains the ocean for a distance of 600 miles, lies in a broad, flat valley, elevated but a few inches above flood level, with an inclination of only about one foot in five miles. This valley, almost always flooded, is covered with vast forests, in which at sparse intervals are found occasional heaves and hard-wood trees of some value. This valley, at least thirty miles wide, has a swift, very deep river running through it, with a breadth of from two to six miles. The thick forest growing up out of the water forms the so-called 'banks.' Here and there are patches of slightly elevated ground on which Indian huts are erected. To make this huge river and to sustain the growth of the vast matted forest, rain—much rain—is needed, and it is a fact that more rain falls in this region than in any other of like extent in the world. As one sails or steams up the great river there are seen occasional patches of green, level vegetation, for all the world like wondrously fertile meadows, and it is not difficult to imagine great flocks of cattle feeding on them, until the sight of a capybara or tapir more than knee-deep

in the green ooze informs one of the real consistency of that tempting and solid-looking meadow; it is little better than a swamp.

"In these extraordinary forests there are found some of the most beautiful and valuable woods in the world, as well as fruits, nuts, oils, balsams, and gums, but—and this but is unsurmountable—they are found as rarely as diamonds in the gravel or gold nuggets in the streams. There is a false impression existing that rubber trees, ebony, rosewood, and all the rest are found in great groves or clusters, like our pine or oak forests. The fact is that these trees are solitary. When two of them are only a quarter of a mile apart (and remember that the quarter-mile is not open space, but thick-matted, almost impenetrable swamp forest) they are considered close together; if they are a mile apart they are not considered to be very far distant from each other. Nor does this huge forest produce any great quantity of food for human beings. The staple articles of food for the dweller on the Amazon is dried pirarucu, a huge, fat river fish, and 'farinha,' the starch of the manioc root."

A Hail from the Gulf Coast.

TARPON SPRINGS, Florida, June 7.—*Editor Forest and Stream:* The winter visitors are all gone. The launches all snug in their sheds. The town has settled into its summer quiet, and we old-timers have nothing to do but go fishing.

And we rather like it. It is so pleasant to be able to take a quiet paddle on the river without keeping one eye over our shoulder on the lookout for a steam launch, or to do a little trolling without a naphtha launch running across our wake and reeling up our line at the wrong end. To be sure, power boats are all very nice in their way, but I am glad their way does not last the year round. But I did not mean to make my short letter an escape valve, for I started in to congratulate you on the grand paper you are making. It's getting better all the time. My neighbor "Kelpie" (who I think you know as one of the "Kingfishers"), remarked to me to-day how pleased everybody was with the "Trails of the Pathfinders." Yes, FOREST AND STREAM is a grand paper, a paper no one need fear to put in the hands of his boys, or his girls, either, for that matter. One thing I like in FOREST AND STREAM, it does not soil its pages with politics. May it live long and prosper.

I notice from the New York papers that you are having some warm weather up there. Better come to Florida and cool off. Seated here at the north window of my little den I am writing in comfort. Just clear of my window stands a red cedar; in the boughs of the cedar are a mockingbird mother and her four young. The old lady is trying to persuade them to fly. Whether they are doubtful of their own ability or are afraid of their surroundings is uncertain, but they are making a great fuss.

We have more birds here than ever before. Mockers, cardinals, and jays are the most in evidence; while the Tallahassee vine or the hibiscus bush can almost always show a ruby-throat. In a walk of less than five miles the other day I started an even dozen coveys of quail.

Fishing is not so good; there is too much grass in the river. Tarpon are plentiful, but one soon tires of catching tarpon; it is too much like work. Soon the redfish will strike in the river, and then the fun will begin; there is more fun in landing a medium sized redfish than the biggest tarpon.

TARPON.

Natural History.

Bullfrogs and Bitterns.

SOME observations on "The Frog's Provender," noted in your issue of last week, have recalled many pleasant memories of boyhood days spent among the ponds of Sullivan county, New York, and at last have satisfactorily explained what for years remained a mystery.

Fifteen years ago I owned an aquarium, at least we called it an aquarium, such a one as probably many FOREST AND STREAM readers owned when they were boys. It was merely an old discarded bath tub sunk in the ground, but imprisoned within its walls lived a truly wonderful assortment of little creatures. There were salamanders that crawled around among the pebbles on the bottom, in company with crayfish, snails, and small, black, red-spotted turtles. Three tiny water snakes entrenched themselves at one end of the sloping beach, while at the other, just as far away as possible, were half a dozen little brook frogs, just learning to use their newly acquired legs. Out in the water swam minnows, tadpoles, sunfish and whirl-a-gig bugs, all living in harmonious contentment. Occasionally, however, one of the tadpoles mysteriously disappeared, and, coincident with the catastrophe, a snake would be seen to increase materially his girth, but, aside from these little tragedies, peace and quiet reigned supreme; until one day—an evil day—when I placed in the tub one of those huge pond bullfrogs. The first to vanish were the little frogs and tadpoles, and by the end of ten days not a salamander was left, and only one lone snake. The fishes lasted well, and only after many days did the last sunfish finally disappear from the tub. But the old fellow must have struck a snag when he tried a diet of turtle shells or crayfish, or perhaps it was remorse for his former companions; for one morning we found him in the water, his ponderous white stomach extended to its fullest extent, lying flat on his back—dead—and so ended our aquarium.

That there is little of the epicure about the frog, I think that we will all agree; but when it comes to gluttony, pure and simple, I give the palm without a murmur to the American bittern (*Botaurus lentiginosus*). Many curious things does the skin collector find in the stomachs or gizzards of birds, but I never heard of anything that would beat this: (1) Fragments of a mouse, partially digested; (2) three small sunfish and a pickerel, two inches long; (3) remains of a frog, four

inches long; (4) a full-grown star-nosed mole, intact with hardly a rumple on his fur. I found the above collection in the stomach of a bittern, shot at Princeton some years ago by Prof. W. E. D. Scott. The bird was mounted, and is at present, I believe, in the university collection. WM. ARTHUR BABSON.

The Skylarks at Rugby.

WHEN I read in *FOREST AND STREAM* that there were English skylarks within easy reach of New York, I rubbed my eyes and asked myself if the news could be true. However, I was determined to find out for myself, and so lost no time in making my way to Rugby, where, sure enough, I found the little brown enchanters singing away as though they were on their native heath.

There is something which appeals strongly to the imagination in the translation of this classic singer of the old world to the new. To think that the music beloved and celebrated of Chaucer and Shakespeare and Shelley should now be ours to hear under our own sky!

In regard to that music I am quite sure we have nothing native to compare with it—be it said without any abatement of patriotism. The mellow notes of the thrush echoing through a wood on a calm summer's evening are fine, and finer still are the thrills of the mockingbird under the moon, but the song of the lark up among the clouds has something positively celestial in it. And I mean by that that the utter joy expressed seems rather to be of heaven than earth.

It will be interesting to note if the song will undergo any change in the bird's new habitat. Your correspondent, Mr. Wilmot Townsend, thought he detected some imitations of our native songsters, and I thought so, too; also, I thought that there was an acceleration of the time, but substantially the song was the same as that which I had heard beyond the sea.

So devoted to his art is the little minstrel that he is given to springing up at any hour of the day (even when the sun is broiling hot, as I proved), but his best efforts are reserved for morning and evening. Just as the sun peeps above the horizon he brushes the dew from the grass and mounts up with his loudest, most joyous strains. Referring to this habit of his, Shakespeare wrote:

"When merry larks are plowmen's clocks."

His evening song is calmer—more suave and flute-like, although, judging by his actions, the bird appears to be

worked up into a perfect frenzy. Shelley, his other great poetic celebrator, alluding to this, wrote:

"In the golden lightening
Of the sunken sun,
O'er which clouds are bright'ning,
Thou dost float and run,
Like an unbodied joy whose race is just begun."

Did space permit, it would be well worth while to introduce here the whole of Shelley's ode, which is undoubtedly the best appreciation of the lark in the English language.

There is a certain mystery about the appearance of the birds in such numbers at Rugby. Where have they been hiding away during past summers, and especially how have they survived our terrible winters? Is it possible that they have acquired, or are acquiring, the migratory habit, and are erratic in their comings and goings? However this may be, there is now strong ground to hope that they have been securely acclimatized.

It is not likely that the present denizens of the meads of Rugby will be allowed to remain long in possession, for the "improver" is around. Soon those beautiful green and ruby-tinted meads will give place to long rows of modern suburban "villas;" the air will resound with the cries of street vendors instead of the notes of the lark, and Philistia will rejoice.

I should record that during my visits out there I never saw a soul except those who were being whirled by on a neighboring trolley line. Thought I, a little bitterly, if only a find of gold instead of skylarks had been made, what a crush and weltering of humanity there would be here! And yet the finding of those skylarks was of infinitely more consequence than would have been the finding of a gold mine. I say that in all seriousness. For a day will come (it may be remote, but it will come), when the average American citizen will think that to make money, eat big dinners, and wear fine clothes is not the only object worthy of a man, and then the skylark will be hailed and esteemed as one of our most precious possessions.

FRANK MOONAN.

NEW YORK, July 21.

A Captive Eagle in Boston.

A SOUTH BOSTON woman who heard a mysterious noise at a window the other day, found perched on the blinds and wildly flapping its wings, a young eagle. She managed alone and unaided to secure the bird, and to immure him in an improvised cage, where he is gradually becoming reconciled to captivity and mutton.

A Quail Thinning Out Theory.

Editor *Forest and Stream*:

Several shooters in this vicinity are under the impression that a brood of quail which have survived the shooting season and the rigors of winter, should be broken up and thinned out before the breeding season or they will not breed. Is there any foundation in fact for such a ridiculous contention?

R. L. E.

MASSACHUSETTS.

[The belief quoted by our correspondent is widespread, but we know of no evidence to support it. The theory, we believe, is based on the assumption that the quail, being very pugnacious, the males of any brood are likely to fight all through the mating season, and so the operations of reproduction to be interfered with. On the other hand, we have heard the belief expressed that the birds simply continue in a flock and apparently have no wish to breed, remaining together all through the summer. It is supposed that where a country is shot over, the males, being the strongest and most vigorous of the brood, will first take to flight, and so will be first killed. There will thus be a dearth of males, and each male will secure a mate without fighting for her. Have any of our readers evidence tending to establish such a supposition? Even if the theory were founded on fact, we do not see what remedy the gunners have. The law says that quail shall not be killed between certain dates, and we conceive that there can be no exception to this law.]

Bull Elk Sees Town Sights.

SEATTLE, July 12.—A big bull elk paraded the main streets of Port Angeles the other day, and after chasing around until he had worked up a nice sweat, jumped into the salt water and regaled himself with a swim across the narrow arm of the Sound from the sand pits to the mainland.

The inhabitants of Port Angeles were surprised to see the elk so friendly and unafraid, for not for twenty years before had an elk—of the four-footed kind—been so sociable and friendly. A number of small boys tried to make up to the visitor from the forest, but he was rather proud and offish, and continued his inspection of the streets of the city alone.

Game Warden Harry Daniels, of Clallam county, cannot help but feel a little proud of the occurrence. To him the visit of the elk means that the game protection under his supervision is a great success. Daniels says the game is more plentiful in Clallam county now than for the last fifteen years.—San Francisco Call.

Squirrel Barking.

Editor *Forest and Stream*:

I am much gratified, and I confess somewhat elated, that my shooting at a noise in the brush went so straight to the mark. For—to drop shooting metaphor—it was beyond my wildest anticipation that the author of the squirrel-barking article should so speedily have been put on the defensive by what I wrote. I admire Captain Kelly's frank declaration of himself as an ambitious would-be myth buster. However, while assuring him of my most distinguished consideration, I will, with your permission and his indulgence, retain to the bitter end as my own signature the name of Rifleman. It can make no difference to Captain Kelly or your readers who I am, since I do not profess to speak as a sharpshooter, nor to have had any personal experience in barking squirrels. The issue is not between Mr. Kelly and Rifleman, but between Mr. Kelly and Audubon. For after all what does the whole thing amount to but this:

Audubon says that he saw Boone bark squirrels.

Kelly says that he has tried to bark squirrels and could not do it.

Therefore Audubon did not see Boone bark squirrels. What a delicious *non sequitur* that is.

Your correspondent appears himself to recognize the weakness of this argument, for now he would dispose of the whole matter by questioning Audubon's veracity. The naturalist records that he saw Daniel Boone in Kentucky. Put on the defensive, Captain Kelly pleads an alibi for Boone. I have not at hand any other authority to show where Boone was or was not at any specified time, but Audubon is good enough authority for me as to this particular point. Audubon says that he saw Boone in Kentucky. That always has done for me, and it does now. I believe that he did see Boone when he says he saw him. If Captain Allen Kelly is to destroy our faith in "squirrel barking," he must do it by good and sufficient proofs; if he is willing to go on record as accusing Audubon the naturalist of uttering a "flawless finished fib" when he describes something that he has seen, he must give us the evidence to sustain the charge. The burden of proof is on him.

It will not do for Captain Kelly to throw doubt on the naturalists of other days by making light of the romantic school of pseudo-naturalists with which we are now all so familiar. As a rule the men of the nineteenth century

set down the things they saw. They were chiefly gatherers of facts, and did not broadly generalize. The romantic school of to-day is built on very different lines. One of its members runs off of doors and sees a bird or an animal do something, and with that as a text, he gives free range to his imagination and writes a book in which he makes a goose or a swallow very little—if any—lower than the angels. Worse than that, they call themselves "naturalists," something which causes the true naturalist to pluck out his hair by handfuls, and to wonder how anybody can believe these advertising romancers.

It is a little difficult to reply definitely to Captain Kelly's letter, for it contains a good deal that is extraneous, and that has no particular bearing on the point at issue. I do not think, for example, that it would be possible for anyone to bark a squirrel with a .44 caliber revolver. I do not think one could commonly hit close enough to the spot.

If Captain Kelly wishes my individual views as to the report that the Boers commonly killed antelope at a thousand yards, or that Morgan's men hit squirrels at 300 yards, I will give them readily. Neither would be possible, in my opinion, except with a rifle fitted with telescopic sights, and even then the feat could be performed but seldom. On the other hand, I can conceive that Natty Bumppo might quite frequently send a rifle ball through two potatoes thrown in the air, provided he had someone to throw them in such manner as to give him a fair chance to do this.

I have shot a rifle a few times myself, and have seen rifle balls do very curious things.

I am interested and gratified to see that two correspondents have come forward to show that squirrel-barking is not yet wholly a lost art.

RIFLEMAN.

WYMORE, Nebraska, July 18.—Editor *Forest and Stream*: I was very much interested in the article on "Squirrel Barkers and Myth Busters," by Rifleman in the current number of *FOREST AND STREAM*. While the myth buster, according to his own story, is not worthy of notice, still he questions the veracity of Audubon, and for that reason should receive attention. In my reading I have always been struck with the fact that those who have studied the birds and woods of America have uniformly found Audubon to have been correct in his descriptions, and truthful in his statements. But Audubon never described the barking of a squirrel by

shooting the bark from under its belly, or under its forefeet, or under its hindfeet. To bark a squirrel, the shot must pass directly under the heart; and that it can be done, and was a common thing fifty years ago, can be testified to by hundreds of men now living. I have seen it done many times.

Those who attended the last Grand American Handicap at Live Birds at Kansas City, will remember one of the contestants, R. W. Cool, from Aledo, Illinois. He was described in *FOREST AND STREAM* at the time as a very deliberate old man, and was one of the ten men who scored up on the last morning to shoot off the tie, and went out on a bird dead out of bounds. I have seen R. W. Cool bark a squirrel many times; and I have seen his father, Jacob Cool, do the same thing dozens of times. There was a man—Robert Woods—living at Aledo in the winter of 1862-3, and I believe he is still there. On pleasant days that winter he hunted squirrels in the timber south of our house, and I generally followed him, and saw him bark dozens of squirrels, and at that time I was past thirteen years of age, and could kill a squirrel without a stick. My father used a long Kentucky rifle, and frequently hunted squirrels, and I have seen bunches of squirrels brought home by him of which one-half did not show a bullet mark. They were barked. I never barked a squirrel myself, because, from the time I was thirteen until I was twenty-three, I did all my shooting between the handles of a plow, and after that time I used a shotgun.

Dr. H. A. Given, of this city, can testify to the barking of squirrels, and can give the names of many men now living in Illinois who did it, and saw it done, many times. Squirrels do not always lie in a tree in a position so that they can be barked, and when I was a boy these were shot through the head, and when a bullet "carried away the front of his skull and a part of his brains" he always came down, but of course that was a long time ago.

Jacob B. Lininger, of this city, is another man who can testify to the barking of squirrels being a common practice when he was a young man. He lived at Peru, on the Illinois River, from 1846 to 1870, and killed more deer with the rifle than any other man in that part of the State, and continued to kill deer in Nebraska after he left Illinois. When I first knew him, twenty-five years ago, he was an expert with the long rifle, and within the past few years I have seen him do fine work with a shotgun in the field. He says the barking of squirrels required no

such expert work with the rifle as did the shooting of deer on the run, or wild turkeys on the wing. He says marksmanship is a thing of the past, because all fixed ammunition is overloaded. The old Kentucky rifle shot a ball no larger than a buckshot, and when laid in the palm of the hand this ball was covered with powder, and that constituted a proper charge, and when the gun was fired, it did not jump out of your hands or kick you.

A. D. McCANDLESS.

HOPE, Kansas.—*Editor Forest and Stream:* In the July 16 number of your paper, I read the article on squirrel barkers by Rifleman. I have heard about barking squirrels since I can remember, and as soon as I read the piece I showed it to my father, who is nearing the three score and ten limit, and he says he has done it himself many times and has seen it done hundreds of times. He used one of the old style rifles, 52 balls to the pound. Not only have I his testimony, but that of two other men in town who are past the sixty year mark, and who have been hunters from boys, and who to-day can shoot with any of the young men; both say they have done it and seen it done hundreds of times. My father was born and raised in Michigan; one of the others is from Ohio, and the other is from Illinois. The one from Illinois is sixty-six years old next month, and he says, "If he don't believe it, let him come out here and I will take him out and show him. I have done it before and I can do it to-day." And they all tell me it was almost a disgrace for a man not to shoot a squirrel through the head. Now, I have known these men for years, and consider them all truthful men, and if the myth buster does not believe it, he can come out and be shown.

O. H. PEASE.

Editor Forest and Stream:

Can squirrels be barked or not? They can. Fifty years ago the average farmer's boy with his squirrel rifle thought nothing of killing them in that way. I have often done it, and with the rifle I then had could still do it, though my hand shakes more now than it did then.

My rifle carried a ball weighing about 80 to the pound; I used it on deer and squirrels, and have shot both within less than fifteen miles of the preserve limits of Allegheny City, Pa. The only deer to be found in all that country now are in the public parks.

When I did not want the squirrels, I would not kill them. If I did not want them, I would wait until I had got one out on a small limb of a tree, then try to hit the limb he sat on a foot away from him. It would send him tumbling down every time, but did not seem to hurt him.

I was across on the Peninsula, a strip of timber that shuts in Erie harbor from the lake, one day last summer, and had two half-grown boys with me. One of these boys had just been given a new Stevens rifle, and he was anxious to try it on about everything that had life in it.

The most of these small caliber rifles won't hurt anything badly when a ball fired out of them does hit it; but these Stevens rifles shoot wicked. I have put a ball out of one of them through two dry one-inch hemlock planks, and nearly through the third plank.

A few Sundays ago a boy who was shooting sparrows with one of these rifles just beyond the city limits, put a ball into the leg of a man who was at least 100 yards away from him when he did it. The man had to go to the hospital, while the boy was taken to the Mayor's office, where, after his gun had been confiscated, he was let go.

I had been trying the gun carried by the boy I had with me to-day on mud turtles that had crawled up on driftwood to sun themselves, and found that I could hit one of them nearly every time. While we were scrambling through the timber in the strip of woods we ran across a large gray squirrel, which was on the ground under a tree when we first saw him.

The boy was about to shoot when I stopped him, telling him that the law was on that squirrel just now. He must not be shot. The squirrel ran up the tree as soon as he saw us, and while we stood watching him he ran out on a small limb an inch or two in diameter, and sat there chattering at us. He was about forty feet above the ground.

"Now, the law forbids me shooting that squirrel," I said to the boy, "but it says nothing about me searing him to death. Watch me and see how I do it."

Taking the rifle I took aim at the limb he sat on, a foot away from him and toward the tree trunk, fired, and missed; then firing again, I hit this time, and the squirrel dropped. The boy was about to rush over and pick him up, but I stopped him. I knew that the squirrel was not hurt badly, only stunned; he was not hurt as badly as the boy would have been if he had made an attempt to pick him up. The squirrel lay there a minute then got up and made tracks to his tree again. He had not been hurt at all; he was only waiting to see if we were going to do any more shooting.

CABIA BLANCO.

CANTON, Pa.—*Editor Forest and Stream:* I have been much interested in the barking squirrels discussion in your journal, and while I do not consider it safe to make any positive assertions on account of the doubt that may be thrown on one's veracity for so doing, I wish to say a word about the matter.

When I was a young man of eighteen or twenty, I conceived that a rifle was the only scientific firearm to use on squirrels, and I had also read of Daniel Boone and his exploits in barking the frisky little fellows. I spent a good deal of time and ammunition in attempting to duplicate his performances in that line, and twice, to my distinct recollection, I succeeded in securing a squirrel without a mark of the bullet on him.

Now, mind you, I don't say that they were barked as Boone did it, but that they died very shortly after I touched the trigger of the rifle aimed in their direction, and in each case there was a little fresh bullet mark on the limb just under the place where their necks had been. They may have died of apoplexy or heart disease or indigestion; but they died, and in my ignorance I had always supposed that I was the cause of their death, not knowing at the time that they could not be killed in that way.

However, I am very glad that this discussion has come up, for I should probably have gone down to my grave, otherwise, thinking I was almost as good a shot as Daniel

Boone, and it is a mighty bad thing for a man to be conceited and know it all.

J. W. PARSONS.

CLARKSDALE, Miss.—*Editor Forest and Stream:* Your correspondent, Rifleman, quotes an unnamed "Myth Buster," who discredits all the records on the subject of "barking" squirrels, by old-time hunters with old-time rifles. The said "Myth Buster" undertakes to demolish what he calls a myth, by reciting his own experience in his effort to perform the feat of "squirrel barking."

This seeking after knowledge at first hands was certainly commendable in the Myth Buster; but he should have taken a guide along to show him a squirrel. It is evident that the animal experimented on by Myth Buster was not a squirrel. Most probably it was a cat, one of the nine-lives variety; or possibly a raccoon. First he "barked" his animal in a variety of ways, then sent a .44 Winchester bullet through its hind leg, then its body, then shot away part of its skull and brains, and finally "chucked" it out of the tree and clubbed it to death. No squirrel that ever grew hair could have stood half the treatment that this animal got.

The writer once shot at a squirrel in a small tree with a Colts .38 caliber pistol. The squirrel jumped to the ground, ran a few steps, and with a gasp or two was dead. On examination it was found that the bullet had cut a track through the hair across the abdomen, without breaking the skin. There was no limb to "bark" in this case, as the squirrel was among the twigs of a pine sapling.

Within the memory of the writer the type of rifle in universal use for sporting purposes, was the old-fashioned "Kentucky" rifle. The present type of long range repeating rifle had never been heard of. The "Kentucky" rifle had a long, heavy, octagonal barrel, with a deep shoulder socket in the stock. There was a silvered bead on the muzzle end, and an open hind sight, both fine.

There were still a few flintlock rifles then in use, and many old ones that had been converted to percussion locks, while most were of more modern make. The caliber was generally small, and was expressed in terms of the number of balls to the pound, as 40, or 60, or 80, to the pound. The balls were spherical, and moulded by the hunter himself, the neck being cut off with a pocket knife.

The powder used was very fine grained, and a common way to measure the charge was to place the bullet in the palm of the hand and pour the powder on it slowly until the bullet was just covered. After pouring the charge into the rifle a small square patch of cotton goods was laid over the muzzle, the bullet placed in the center and pressed down with the thumb, after which it was rammed home with a long, slim, hickory rod, that fitted into thimbles on the under side of the barrel, or was thrust down between the barrel and stock, when the stock extended up to the muzzle.

An important feature of these old-time rifles, that had much to do with the accurate shooting done with them, was the set trigger. There were two triggers, the hind one being first pulled to set the other on edge. In shooting the rifle, at the instant when the sight was in the right place, the merest touch of the trigger with the end of the finger set it off. These details are doubtless familiar to your readers, but the younger generation of the FOREST AND STREAM family are probably strangers to the old "Kentucky" rifle.

The writer, in his boyhood, has attended country shooting matches, where the prizes were not turkeys, as in the matches attended by Sam Lovell and Uncle Lisha, where the distance was measured in rods instead of yards; but a beef usually afforded the prizes that were shot for. There were five prizes in the beef, beginning with the choice of hind quarters, down to the hide as the fifth choice.

The distances were 40 yards off-hand, or 60 yards with a rest. The targets had a cross mark made in the center with a pencil, and the winners had to knock out the cross, or come very near it.

In squirrel hunting I do not remember any hunters who made a practice of barking squirrels, though I have heard it alluded to as one manner of killing them. It was not considered sportsmanlike to hit them anywhere except in the head, and that was too tempting a target to aim anywhere else.

When the Civil War ended, this writer, then scarcely more than a lad in age, but with a big bunch of experience on hand, returned home and found the family "refugeeing" in the country. Food, money, and ammunition were very scarce. There were plenty of squirrels in the woods not far from the house. Using shotguns was too expensive in ammunition; but there were a couple of old-fashioned rifles about the house that had escaped the exigencies of the war and the eyes of the raiders, and the family larder was often dependent for meat upon the prowess of a younger brother and myself, among the squirrels with these old rifles.

The subject of scarcity of ammunition calls to mind, that when the writer came out of Port Hudson, Louisiana, in 1863, after a six weeks' siege, a prisoner on parole by the grace of General Banks, he carried home a tin canteen that had been filled with powder by emptying rifle cartridges into it, together with a quota of musket caps mingled with the powder. A piece of corn-cob was driven tightly into the mouth of the canteen and broken square off, around which some molasses was smeared. This innocent-looking canteen passed General Banks' sentinels without exciting suspicion, and was the means of much good sport in the woods and fields in the few months' interval before the prisoner on parole had to report for duty again after being exchanged.

COAHOMA.

Life in the Woods.—XIII.

Some Queer Things.

ON another day we hunted some, but without any luck, and later carried in some more deer. That evening the talk turned on queer experiences in the woods, and among the narratives were the following:

The Colonel for some reason drifted to the subject of dreams, and said that from the time he first began hunting in the North Woods dreams had had quite an influence with himself and his companions for the reason that a great many of them came true. Oftentimes, he said, the first salutation in the morning would be, "Well, what did you dream last night?" "Who is to shoot a deer to-day?" Sometimes the reply would go around, "Nothing dreamed last night." At other times, "I had a dream," would be the answer, and then it would be told to the company. For instance, S. B. dreamed one night of seeing a large buck at the Norway choppings. He was a large, peculiar looking deer, with big, broad antlers, homely and very old looking, and, according to the dream, the Buckeye shot him. As evening approached, the Buckeye, happening near the identical spot, posted himself for the evening's watch. Just as the twilight began to disappear, a large buck made his appearance among the Norways, and a moment later was the Buckeye's game. An examination proved him to be identical with S. B.'s dream. On returning to camp the Buckeye asked S. B. to describe again the place and deer, which he did, even to the most unimportant detail, all the time not knowing that just such a deer had been shot at just such a place.

Another member of the party told how before he left home he had a dream about as follows: It seemed that he had been very successful in the hunt, killing two of the largest deer, and that the day he secured the last one he brought the heart in and laid it with three others all in a row on a log in front of the camp. The two from his big deer headed the procession, and as he stood looking at them, up came S. B., softly behind him, and putting his hand on his shoulder said: "I am proud of you." This dream he did not relate to any of the members of the party, but told the folks at home of it, and, in fact, had forgotten all about it until the day it was fulfilled exactly as he had dreamed it in every particular.

The Colonel also related another odd experience. He had just been telling about the buck dream and continued by saying: "On the same hunt when we were about to break camp at Echo Lake, and were carrying some things down to the river, S. B. was making a drive, and it was near the place where he had killed two deer when we first came in; I was on the runway watching. Pretty soon I saw two deer passing through the woods slowly. I fired quickly and the deer disappeared. Upon going up to where I saw them, I found signs that showed that one of them was badly wounded. Presently both John and S. B. came up and showing them the blood, I left them to go on and look up the deer while I started back to the river. They soon came up to it, and after killing and dressing it, they dragged it out to the road. By that time I was returning and happened to meet them just as they struck the road. It proved to be a doe with horns, and in all of the experience of our party it is the only horned doe that has ever been seen. It has also proved to be the only doe with horns that has ever been killed in that part of the State. Later on an account of the killing of this doe was published in a sporting paper, and it developed the fact that up to that time only two instances in addition to this one were known among hunters where a doe with horns had been shot."

About this time someone asked if anyone present had ever known of a wounded deer attacking a person. Bill said that the nearest incident he had ever known to such a thing happened in the fall of 1887. In his own language this is the way it occurred: "Two companions, Louis and Brad, and I were hunting in the woods of northern Michigan, and we had been out all day at this particular time without having had any success; that is, we got no deer up to three o'clock, and were hunting toward camp. We came to a large cedar swamp which I knew was a good place for deer, as there were some small islands in it which were high and dry. So I told Louis and Brad to go around to a certain place and stand while I went in on the opposite side to try and drive some deer to them. I had not got into the swamp very far when I heard some deer start and run right toward the place where I had told my companions to stand. Sure enough they

went, for shortly I heard Louis's gun crack. That made me feel good, for I knew there were three or four deer running ahead of me, and when I heard the shot I expected they would get two or more, as my friend Brad was one of the best shots in the woods. But after the gun cracked, Louis began to let out the most outlandish yells you ever heard, and to shoot and yell for full two minutes at a time. I thought he must be surrounded by wildcats, and that they were all pitching on him, for he fired more than ten shots and let out more than fifty yells that made the woods ring. I hastened through the swamp as fast as I could to his relief. When I got on dry land and in sight of the place where I had told him to stand, there, or not far from there, I saw a large buck lying on the ground with his feet under him and my friend Louis standing about eight feet away and right straight behind the deer. Brad was about the same distance from the buck, but directly in front of me. When I saw this, maybe I wasn't mad, and maybe I didn't abuse Louis for making such an uproar and letting the other deer get away without even seeing them. I did abuse him in no mild language for about three minutes, when all of a sudden the deer jumped up, turned right about, and, with his head down, made for Louis. Louis had his gun in his hand, but seemed to forget that, and dodged behind a small hemlock tree and began to reach for limbs, but he could not climb on account of the foot-wear he had on. Just then the deer's head struck the tree, one horn going on each side of it, and at that moment Brad yelled to Louis: "Why don't you shoot him?" Brad could not shoot without firing directly at Louis. That seemed to fetch Louis to his senses, for he raised his gun, took no aim, for the muzzle was not more than a foot from the buck's head, and fired, the ball finishing him. If you ever saw a live corpse, Louis was one at that time, for Brad and I had to extend ourselves and brace him up. We had nothing but hunters' soothing syrup with us, but with some labor and more syrup we fixed him up all right. When I saw he was in the land of the living, I had to scold him some more for yelling so when he first saw the deer. He must have fired at first without aiming, for the deer was not more than fifty feet from him, and he barely put the bullet through the top of the buck's neck; in fact, just enough to paralyze the neck, so that he could not guide his head; consequently he was getting up and falling down in a vain attempt to get away, with Louis after him, shooting and yelling, but never hitting him in all the fracas until after he found he could not climb the tree. We finally got Louis and the deer into camp, and there was not a happier man in the woods that night than Louis."

Louis, who was present, denied the tree-climbing part of the story, but the boys said that Bill's account was the one that went, and so it goes.

While hunting on the Poplar River one fall we had an old hound with us. He was very old and very slow, but a good dog, and one whose fame as a fox hunter extended over several counties. The old fellow would go out nearly every day and take a run after a deer, so that before long the game seemed to get used to him, and did not pay much attention to his bellowing. One day Doc and I got in rather early, and while we were eating our dinner we heard the old dog howling off south of us, and apparently making our way. We grabbed our guns and put off to a runway that crossed the creek about a quarter of a mile from our camp. At first it seemed as if the old fellow was coming right to us, but finally he ceased barking and nothing was heard of him; so after about thirty minutes we began to talk about going back to camp. Finally Doc shot a red squirrel with a "squib." Doc sat on a log skinning his squirrel, and I stood on the runway, the stock of my rifle resting on the ground and the muzzle in my left hand. With my right hand and the head of a pin I was engaged in scratching out some rust that had formed in the muzzle. This was fully half an hour after the dog had stopped giving tongue. All at once I heard Doc make a queer sort of noise, and looking up, I saw a spike horn buck about one leap away coming straight at me at top speed. The next moment he would land on top of me, and crouching down I let a yell out of me like a freshman at a college football game, at the same time endeavoring to get my gun to my shoulder. I expected to be flattened out, but I wasn't. That deer while in the air twisted himself half round and striking the ground at right angles to me, bounded off unhurt, although a perfect fusillade of shots followed him. We never touched him. I looked like a sheep, while Doc rolled off his log and almost had hysterics laughing at the funny movements I went through trying to dodge that deer, while I kicked to think I didn't get a half dozen balls through him. About half an hour later the old hound came along on his track, but we caught the dog and went to camp.

Some of the boys were inclined to doubt my statement that the deer turned while in the air, and said I imagined it, but the Colonel said he did not doubt it, for he had seen them go through such motions himself. He related how at one time, while hunting with the same dog, a buck just started by the old fellow came trotting up from a creek bottom, and was passing only eight rods in front of him. Just as he passed a big pine tree, at the roots of which lay the top of another pine which had been broken off by the wind, a companion who was with the Colonel, bleated to stop the deer and to get a good standing shot. Instead of stopping, as was expected, the old fellow jumped backwards behind the tree top and ran off at full speed, keeping himself so well behind the cover that they never got a shot.

Another member of the party, as his contribution, told about finding, near the Spread Eagle Lake, the bodies of two bucks, apparently not long dead, which, while fighting, had interlocked their horns in such a way that they could not be disengaged. Both animals were covered with wounds, and for rods around the ground was all torn up and covered with blood and hair. Evidently they had a long fight, and had lived for some little time after they had become fastened together, for both were quite poor. The horns were cut from the heads, and so tightly were they interlaced that up to this time no one has been able to get them apart without breaking them. During the same hunt, the Buckeye came across two bucks which had been fighting. Both were so badly

used up that they could not get away, and he had no difficulty in shooting them. They had been at it a long time, and evidences of a desperate struggle were on all sides. They were unequal in size, but the smaller fellow evidently—probably on account of his quickness—seemed to have the best of it, as he had more strength left and showed fewer wounds. On this same hunt also the Buckeye killed two deer with one shot, a doe and a fawn, which stood side by side when he fired. This caused Bill to remark that he had done the same thing. He was standing on the edge of a chopping and saw a buck walk out in plain sight. He took careful aim and fired. Down went the buck, when what was his surprise to see the legs of a deer some twenty rods further on kicking in the air. An examination showed that the ball which had broken the back of the buck had also knocked down a doe, which stood in the same line, but which Bill had never seen at all.

"Speaking of strange shots," said S. B., "and the way a deer hangs to life, reminds me of an experience of mine on these same grounds some years ago. The Buckeye and myself were out one day when he fired three quick shots at a deer running. The animal went on for nearly twenty rods as if unhurt, and then fell dead. Before we went up to it he said: 'I'll bet I put every ball through her shoulders.' We hurried up, and looking the deer over found every bullet had hit her forequarters; but what was more surprising, on dressing her we found every ball had passed through her heart, literally tearing it to shreds. One ball had passed through as the deer approached him, one when it was squarely opposite him, and one after it was a little past him, and yet that deer went twenty rods before it fell."

Someone remarking how queer it was that a deer could get through a swamp or windfall or all kinds of bad places, developed the fact that one of the party, while hunting near the "Gorge" one day, saw some fresh blood on the snow. Not knowing of anyone hunting in that vicinity, he followed the track back and found a place where the deer, in attempting to come down a steep ledge, had slipped, and in the fall had caught one of its front legs under a rock, seemingly breaking it below the knee. He followed the deer for some distance, and caught sight of it two or three times, but was unable to get a shot.

But the climax of descriptions that night was the account of a buck which, chased by hounds at an early hour, ran into Ashland, Wis., a city of some 10,000 inhabitants, and took right down the main street. Finally it ran into the yard of a small house, through the open door, upstairs, and into a back room. The hook and ladder company of the fire department turned out to catch it, but while they were making their plans, the deer jumped through the closed window from the second story and broke two of its legs. It was then killed. The animal was about three years old, was a good sized buck, and evidently had been run a long time by the hounds, which were following close behind.

CAROLUS.

[TO BE CONTINUED.]

Confiscating Sportsmen's Guns.

WYMORE, Nebraska, July 18.—*Editor Forest and Stream:* In your editorial entitled, "Pains and Penalties," in your issue of July 16, you seem to take the position that there is a conflict between the New York courts, or the Supreme Court of the United States, and the Supreme Court of Nebraska, on the question of the right of the State to take and destroy property found in use in violation of the game laws. If that is the position you take, I think you are mistaken. As I read the cases, there is no conflict. Judge Letton, who wrote the opinion in the Nebraska case, cites the New York case, and distinguishes between the two. In the New York case, the nets could only be used for an unlawful purpose, and the State under its police power could declare them a public nuisance, and authorize their destruction. The Nebraska court holds, "but if property, of a nature innocent in itself and susceptible of a beneficial use, has been used for an unlawful purpose, a statutory provision subjecting it to summary forfeiture to the State as a penalty or punishment for the wrongful use, without affording the owner thereof opportunity for a hearing, deprives him of his property without due process of law."

This distinction is so clearly pointed out, by Judge Letton, in the Nebraska case, and the whole subject so ably discussed, that I take the liberty of sending you the opinion in full, without further comment.

A. D. McCANDLESS.

The Opinion.

Letton, C. On the 3d day of August, 1902, P. E. McKillip, D. B. McMahon and W. E. Harvey were engaged in hunting prairie chickens in Boone county, in violation of the game law of 1901, using three shot-guns. The deputy game warden, Harry L. McConnell, seized the three shotguns while they were so engaged in hunting prairie chickens. P. E. McKillip was the owner of the guns, and the guns were valued at the sum of seventy-five dollars. McKillip brought an action of replevin against the defendant deputy game warden for the possession of the guns. The case was tried to the district court upon an agreed statement of facts, substantially as above stated. The court found for the plaintiff, and rendered judgment accordingly. The defendant brings error to this court.

The game warden claims the right to hold the guns under authority of Section 3 Article III., Chap. 31, Comp. St. 1901, which is as follows:

All guns, ammunition, dogs, blinds and decoys, and any and all fishing tackle in actual use by any person or persons while hunting or fishing in this State without license or permit, when such license or permit is required by this act, shall be forfeited to the State; and it is made the duty of the Commissioner and every officer charged with the enforcement of this act, to seize, sell or dispose of the same in the manner provided for the sale or disposition of property on execution, and to pay over the proceeds thereof to the county treasury for the use of the school fund.

He contends that the statute authorizing game wardens to seize and forfeit to the State all guns in actual use by persons hunting in violation of the game law is a valid exercise of the police power of the State, while

the defendant in error contends that the aforesaid statutory provision violates the provisions of the fourteenth amendment of the Constitution of the United States, which declares, "nor shall any State deprive any person of life, liberty or property without due process of law, nor deny to any person within its jurisdiction the equal protection of the laws," and of Section 3, Article I., of the Constitution of the State of Nebraska, which provides that no person shall be deprived of life, liberty or property without due process of law. The protection of wild animals suited for the purpose of food from indiscriminate slaughter by hunters has been the object of legislation from the most ancient times. The theory upon which the lawmaking power assumes to act is that all wild game belongs to the State in its sovereign capacity as a trustee for the whole of the public, and that consequently the State may, as a proper exercise of its police power, adopt such rules and regulations with reference to its preservation, and such penalties with reference to a violation of such regulations, as are necessary to accomplish the end desired—the preservation to the people of the State of the pleasure, sport and profit derived from the hunting, pursuit and capture of the wild animals living therein. In this case the defendant in error, McKillip, admits that it is within the power of the State, in the just exercise of its police powers, to prohibit the killing of fish and game at certain seasons of the year, but denies that it has the right to take his property from him and confiscate it to the State without giving him his day in court. He contends that the police power in regard to the confiscation of guns, dogs, blinds, decoys and fishing tackle is upon exactly the same footing as the police power in regard to the regulation of the sale of intoxicating liquors, and that, since before liquors which have been seized are destroyed there must be a judicial determination by a court as to whether the owner was engaged in unlawfully selling or keeping for sale intoxicating liquors, so there must be as to his property. He further contends that since the statute contains no provisions for determining whether the property was liable to condemnation for the criminal acts of those who had it in their possession, and since it merely authorized the game warden to seize the property without warrant or process, to condemn it without proof, and to sell it as upon execution, it deprives the defendant of the property rights which are guaranteed to him by the Constitution.

The laws of the State of New York declare that any net or other means or device for taking fish found in the waters of the State, in violation of the laws for the protection of fish, is a public nuisance, and authorized game constables to destroy such nets. Certain nets were seized and destroyed, and an action being brought against the officers for their value under these provisions, the Court of Appeals of the State of New York held that the declaration by the Legislature that the nets or other devices found in the waters of the State are a public nuisance is a valid exercise of the legislative power, and that the further provision requiring the destruction of such nets, such destruction being an incident of the power of abatement of the nuisance, and not a forfeiture inflicted as a penalty of the owner, is not in violation of the constitutional prohibition of taking property without due process of law, but further held that that part of the act authorizing the destruction of nets found upon the shore was unconstitutional, since nets not found in the waters are not a nuisance per se. A writ of error being sued out to the Supreme Court of the United States from this judgment, that court affirmed the judgment of the Supreme Court of New York, and says (Mr. Justice Brown delivering the opinion): "The main, and only real, difficulty connected with the action in question, is in its declaration that any net, etc., maintained in violation of the law for the protection of fisheries, is to be treated as a public nuisance, and may be abated and summarily destroyed by any person; and it shall be the duty of each and every protector aforesaid and every game constable, to seize, remove and forthwith destroy the same." The Legislature, however, undoubtedly possessed the power, not only to prohibit fishing by nets in these waters, but to make it a criminal offense, and to take such measures as were reasonable and necessary to prevent such offenses in the future. It certainly could not do this more effectually than by destroying the means of the offense. * * * In this case there can be no doubt of the right of the Legislature to authorize judicial proceedings to be taken for the condemnation of the nets in question, and their sale or destruction by process of law. Congress has assumed this power, in a large number of cases, by authorizing the condemnation of property which has been made use of for the purpose of defrauding the revenue. Examples of this are vessels illegally registered or owned, or employed in smuggling or other illegal traffic, distilleries or breweries illegally carried on or operated, and buildings standing upon or near the boundary line between the United States and another country, and used as depots for smuggling goods. In all these cases, however, the forfeiture was decreed by judicial proceeding. But where the property is of little value, and its use for the illegal purpose is clear, the Legislature may declare it to be a nuisance, and subject to summary abatement. Instances of this are the power to kill diseased cattle, to pull down houses in the paths of conflagrations, the destruction of decayed fruit or fish or unwholesome meats, of infected clothing, obscene books, or pictures, or instruments which can only be used for illegal purposes. While the Legislature has no right arbitrarily to declare that to be a nuisance which is clearly not so, a good deal must be left to its discretion in that regard, and, if the object to be accomplished is conducive to the public interests, it may exercise a large liberty of choice in the means employed."

The State of Wisconsin has an act, substantially the same as that of New York, providing for the protection of fish, and authorizing the destruction of nets, declaring the same to be public nuisances. In the case of Bittenhaus vs. Johnston, 92 Wis. 588, 66 N. W. 805, 32 L. R. A. 380, the validity of this provision came before the Supreme Court of Wisconsin. The court says

It has been repeatedly said that neither the fourteenth amendment "nor any other amendment to the Constitution of the United States" was designed to interfere with the power of a State, sometimes termed its police power, to prescribe regulations to promote the health, peace, morals, education, or good order of the people, and to legislate so as to increase the industries of the State, develop its resources, and add to its wealth and prosperity." The court further says: "The plaintiff, having voluntarily put the nets to an unlawful use, which made them public nuisances under the statute, is in no position to recover damages from the defendants for having, as public officials, obeyed the law in abating the nuisance by seizing and destroying the nets. Of course, the plaintiff had his right of action to determine whether the nets were or were not in such unlawful use. We must hold that the plaintiff has not been deprived of his property without due process of law."

No case has been brought to our attention in which a court has construed a statute which provides for the seizure, forfeiture to the State, and sale of property of the kind involved in this case which has been used in violation of the game laws. As a rule, the statutes have declared nets and like devices which can only be used in violation of law to be public nuisances, and provided for their abatement by their destruction by public officers. The distinction between nets, which under the laws of the States providing for their destruction can only be used for an unlawful purpose, and firearms, which under the laws of this and other States may be used for many other purposes, innocent and lawful in their nature, is clearly apparent, and has been recognized by our Legislature in the act under consideration. In Section 1, Article III, of this act, the Legislature of this State has provided:

Every net, seine, trap, explosive, poisonous or stupefying substance or device used or intended for use in taking or killing game or fish in violation of this act, is hereby declared to be a public nuisance and may be abated and summarily destroyed by any person, and it shall be the duty of every such officer authorized to enforce this act to seize and summarily destroy the same, and no prosecution or suit shall be maintained for such destruction; provided, that nothing in this division shall be construed as authorizing the seizure or destruction of firearms, except as hereinafter provided.

The provisions of this section as to nets and like devices are substantially the same as those contained in the game laws of New York and Wisconsin heretofore referred to, and with the conclusion of these courts with reference to laws of like nature we have no fault to find. But there is a broad distinction between this section and Section 3, under which the plaintiff in error justifies. The Legislature has not declared a gun to be a public nuisance, and has not ordered its destruction as an abatement of the same. The seizure of the property provided for by this section is evidently intended not only to put it out of the power of the offending person to carry on the destruction of game by depriving him of the implement of destruction, but also to operate as a penalty or punishment for an unlawful act committed by him. It is of the nature of a common-law forfeiture of goods upon conviction of a crime. In *Ieck vs. Anerson*, 57 Cal. 251, it appeared that the plaintiff had rented certain boats and nets to a Chinese sherman, and that the property was used in violation of a statute of the State which provided that "all nets, seines, fishing tackle, boats and other implements used in catching or taking fish in violation of the provisions of this chapter" shall be forfeited or may be seized by a peace officer of the county or his assistant and may be by him destroyed or sold at public auction, upon notice posted in the county for five days. The court held that so much of the statute as authorized the property to be sold without judicial proceedings was unconstitutional and void. It will be noticed that boats were included which were susceptible of a lawful use.

Varden vs. Mount, 78 Ky. 86, 39 Am. Rep. 208, was an action to recover the value of certain hogs. The town ordinance provided that it was the duty of the town marshal to take up the hogs running at large upon the streets, to advertise them for three days, and to offer them at public sale to the highest bidder, and, after paying the expenses thereof, to pay over to the rightful owner the balance, if any. The court held "the right to forfeit should not be extended beyond impounding the hogs. When that is done the necessity for summary and precipitate action ceases, and judicial proceedings looking to forfeiture may then properly begin, and that the ordinance was unconstitutional."

Lowry vs. Reinwater, 70 Mo. 152, was an action to recover the value of a dining table. The defendant pleaded that he was a member of the Board of Police Commissioners of the city of St. Louis, and that under the statute it was his duty, when he had knowledge that there was a prohibited gaming table kept or used in the city of St. Louis, to issue a warrant directing some officer of the police force to seize and bring before him such gaming table, and made it his duty to cause the same to be publicly destroyed by burning or otherwise. These provisions were held unconstitutional and void.

In *Lawton vs. Steele*, 119 N. Y. 226, the Supreme Court of New York was of the opinion that it was only because the nets found in the water were a public nuisance that they might be destroyed, and that if the destruction of the nets was intended as a penalty it was unconstitutional, and also that nets not actually found in the water could not be seized. "But," says the court, "the Legislature could not go further. It could not decree the destruction or forfeiture of property, used so as to constitute a nuisance, as a punishment of the wrong, nor even, we think, to prevent a future illegal use of the property, it not being a nuisance per se, and appoint officers to execute its mandate. The plain reason is that due process of law requires a hearing and trial before punishment, or before forfeiture of property can be adjudged for the owner's misconduct. Such legislation would be a plain usurpation by the Legislature of judicial powers, and, under guise of exercising the power of summary abatement of nuisances, the Legislature cannot take into its own hands the enforcement of the criminal or quasi crim-

inal law." When the same case reached the Supreme Court of the United States, while the majority of the court held that the law in question was a valid exercise of the police power, Chief Justice Fuller, with whom concurred Mr. Justice Brown and Mr. Justice Field, filed a dissenting opinion, in which he says: "The police power rests upon necessity and the right of self-protection; but private property cannot be arbitrarily invaded under the mere guise of police regulation, nor forfeited for the alleged violation of law by its owner, nor destroyed by way of penalty inflicted upon him, without opportunity to be heard."

In *Sentell vs. New Orleans & Carrollton Railroad Com.*, 166 U. S. 698, it is said by Justice Brown: "But in determining what is due process of law, we are bound to consider the nature of the property, the necessity for its sacrifice, and the extent to which it has heretofore been regarded as within the police power. So far as property is inoffensive or harmless, it can only be condemned or destroyed by legal proceedings, with due notice to the owner; but so far as it is dangerous to the safety or health of the community, due process of law may authorize its summary destruction."

In *Colon vs. Lisk*, 153 N. Y. 188, a later case than *Lawton vs. Steele*, a statute providing that every vessel unlawfully used in interfering with oysters planted in the waters of the State may be seized by the game protectors, and upon six days' notice a justice might take evidence, and, if found to be so engaged, the vessel should be ordered sold, and the proceeds paid to the Commissioners of Fisheries, Game and Forestry, was held unconstitutional, the court saying: "It is to be observed, in passing, that the use for which vessels and fixtures may be forfeited under this act does not constitute a nuisance, either at common law or under this or any other statute. Nor is the property itself a nuisance. Hence it is obvious that the validity of this act cannot be maintained upon the ground that either the act or the property is a public nuisance, and, consequently, that the Legislature had the power to authorize its abatement."

In *C. B. & Q. R. Co. vs. State*, 47 Neb. 549, this court held: "The Legislature cannot, under the guise of a police regulation, arbitrarily invade private property or personal rights, but it must appear to the court, when such regulation is called in question, that there is a clear and real connection between the assumed purpose of the law and its actual provisions."

There is a clear and marked distinction between that species of property which can only be used for an illegal purpose, and which therefore may be declared a nuisance and summarily abated, and that which is innocent in its ordinary and proper use, and which only becomes illegal when used for an unlawful purpose. We know of no principle of law which justifies the seizure of property, innocent in itself, its forfeiture, and the transfer of the right of property in the same from one person to another as a punishment for crime, without the right of a hearing upon the guilt or innocence of the person charged before the forfeiture takes effect. If the property seized by a game keeper or warden were a public nuisance, such as provided for in Section 1, he had the right under the duties of his office at common law to abate the same without judicial process or proceeding, and the great weight of authority is to the effect that such common-law rights have not been abrogated or set aside by the provisions of the Constitution; but if the property is of such a nature that, though innocent in itself and susceptible of a beneficial use, it has been perverted to an unlawful use, and is subject to forfeiture to the State as a penalty, no person has a right to deprive the owner of his property summarily, without affording opportunity for a hearing and without due process of law. The usual course of proceedings in such case has been either, as an admiralty and revenue proceedings, to seize the property, libel the same in a court of competent jurisdiction, and have it condemned by that court, or, as in criminal matters, to arrest the offender, and to provide that upon his conviction the forfeiture of the property to which the offender's guilt has been imputed, and to which the penalty attaches, should take place. These have been the methods of procedure for centuries. No other has been pointed out to us in the brief of the plaintiff in error. We are therefore constrained to the opinion that, in so far as the section under consideration provides for the seizure, forfeiture, and transfer of title to property without a hearing upon the guilt or innocence of its owner, it violates the constitutional provisions. Whether or not a forfeiture can be provided for as a punishment for crime under our Constitution is a question not raised or decided in this case.

We recommend that the judgment of the district court be affirmed.

Nova Scotia as a Game Country.

SOUTH BROOKFIELD, Queens County, Nova Scotia, July 20.—*Editor Forest and Stream*: In looking over and reading different sporting magazines and papers published both in the United States and Canada, I often see long articles and stories about the hunting of big game in Maine, New Brunswick, and parts of Canada, but very seldom anything about what is done in Nova Scotia, where there is plenty of game and lots of it got by your American sportsmen who visit those parts where the game is.

The only reason that I can account for it is that those who do come here and have such good luck are afraid to say anything about it for fear it would encourage too many others to come (as they expect to come here again), and are afraid it might interfere with them in having a good time. We have plenty of big game here, and the counties of Lunenburg, Queens, Shelburne, Yarmouth, and Digby are noted for their good sporting grounds. Moose are often seen quite near the farmers' homes, and occasionally you will see one feeding on the meadows as you are passing along on the train. We have plenty and as good guides as can be found in any part of the Province. I wish to give you the names of a few close at hand: W. S. Crooker, James B. McLeod, Herbert L. Spidle, and I. Pitman Smith, all of whom are

thoroughly acquainted with the hunting grounds for big game.

We have good railway facilities, so that a sportsman can almost be landed in a moose yard. However, it is only a matter of a few hours after leaving the train when his guide can have him on the hunting grounds, almost surrounded with good game. In addition to the moose, we have bears, quite plenty some seasons; wildcats we have in abundance; foxes are also quite numerous. The license fee now is only \$30 for moose, and includes any of the game named above, and the sportsman can take the heads, antlers, and as much of the meat as he likes home with him.

The trout and salmon fishing has been extra good this season. Trout especially have been very plenty. I hope, after the season opens, to be able to give you a good account of the work so as to let your readers know what is to be had in regard to game here, as there are now quite a number of sportsmen trying to engage guides, and I expect to see good results.

GEORGE SEAMAN.

A Turkey Story.

THERE are turkey stories as well as fish stories, if anyone should ask you, and N. P. Bullock (Dock) tells the following, and vows that it is true:

A few days ago he was not far from Doehead, near the old race track back of the Sessum field, when he saw ahead of him two wild turkey gobblers fighting. Mr. Bullock stepped out into the bushes and crept along till he was opposite the fighting fowls. So intent were they in their contest that he was not heard. With a stealthy step he advanced till he was almost upon them, and then he made a spring and caught the two by the neck, one in each hand.

Then ensued a battle between man and bird. With wings and feet the latter fought, scratching Mr. Bullock's arms and tearing his clothing. With much difficulty one bird was carried to the ground, where its head was crushed by the man's foot, while the other maintained its desperate scratching with feet and striking with wing. The first one disposed of the other soon fell an easy victim.

Mr. Bullock says that he had no idea how strong a turkey was before. The two turkeys were grown gobblers with beards nearly three inches long.—Tarboro (N. C.) Southerner.

Watch Compass.

ADELPHIA, N. J.—Get the number of hours from midnight, divide by two and point the hour at the sun so that the shadow of a match or lead pencil falls directly across the center of the watch; 12 o'clock will be north, 6 south, 9 west, and 3 east. Suppose it is 9 A. M.; number of hours from midnight is 9; one-half is 4½; point 4:30 at the sun so the shadow of a match or lead pencil fall across center of watch, and 12 is north, 6 south, 3 east, and 9 west. Suppose it is 6 P. M.; number of hours from midnight, 18; one-half, 9; point 9 at sun and 12 is north, 6 south, 3 east, and 9 west.

Also when the sun is hidden on a cloudy day, take a lead pencil or stick that is well sharpened and place it on the thumb nail. By looking closely you will see a faint shadow which will give you a very good idea of the direction of the sun, and may be useful to one lost on a cloudy day.

C. L. BERGE.

July Woodcock.

SAYRE, Pa.—So far as reports are concerned, one may accept the fact that fewer woodcock have been shot during July than for some years past. The same old grounds have been worked out, and the usual conditions have prevailed, but the birds have simply failed to exist. It is a great pity that Pennsylvania should permit the infant woodcock to be destroyed at a season when the fledglings should have the ample protection required.

M. CHILL.

100 Sportsmen's Finds.

Some of the Queer Discoveries Made by Those Who Are Looking for Game or Fish.

100

FORT LAUDERDALE, July 4.—About ten miles out from Fort Lauderdale the dead body of a man was found by L. H. Bryan and W. H. Brantly, while out hunting in the Everglades on the second.

The skeleton showed that the man had been dead about two years, as he had two guns with him, one a shotgun, the other a rifle, both of which were rusty.

It is supposed that he was a hunter who went out in the glades to hunt alligators or otters, but either got sick and started to walk in or was bitten by a snake and died there alone.

There have been several panthers seen in and around there, and some think that he might have been caught by one, but as all his clothes were gone and seemingly no bones broken, it is very difficult to determine what was the cause of his death.

As no one has been missed from here, it is impossible for anyone to tell who the victim was.—Florida Times-Union.

Nor long since, in a Mississippi court, a colored man sued a neighbor for damages for killing his dog. Col. M., defendant's lawyer, called "Sam" Parker, a negro, to prove that the dog was a worthless cur for whose destruction no damage ought to be recovered.

"Sam, did you ever know this dog?" Col. M. asked. "Yes, sah, I wer' pussonally acquainted wid dat dog." "Well, tell the jury what sort of dog he was," said Col. M.

"He wer' a big yaller dog." "What was he good for?" Col. M. asked. "Well, he wouldn't hunt; he wouldn't do gyard duty; he jes' lay 'round an' eat. Dat make 'em call him w'at dey did."

"Well, sir, what did they call him?" asked Col. M. "Dey called him 'Lawyer,' sah."—Philadelphia Public Ledger.

Fish Chat.

A Grand Game Fish.

ALTHOUGH there still remains much to be learned regarding the habits of that magnificent game fish, the striped bass, it is unquestionably the greatest favorite among salt-water anglers of all the species found on the Atlantic Coast. It may lack in a measure the great popularity of the squeteague, or weakfish, as it is called by many anglers, but with those who delight in battling with a fish that possesses the greatest strength and activity, the bass will hold its own against all comers. Genio C. Scott, in his "Fishing in American Waters," in treating of this species, truly says:

"Nearly every American angler of a tidal river regards the striped bass as the fish par excellence to be angled for. * * * It is great game when weighing anywhere from ten to thirty pounds. In muscular power the bass equals the salmon, but it lacks the caudal power for leaping which is so palpable in the form of the salmon back of its adipose fin, including the crescent-shaped tail."

In its distribution it ranges from Georgia northward all along the Atlantic Coast as far east as northern points of Nova Scotia, and in many localities of the Gulf of St. Lawrence it is more or less abundant, the Miramichi River, which empties into the Baie des Chaleurs, being, so far as I know, its western limit on that shore, the fish entering that river in great numbers in the autumn and remaining there until the following spring. From New Jersey southward it is popularly known as the "rock fish," but elsewhere it is recognized by its proper title, the striped sea bass.

Characteristics of the Bass.

And what a beauty it is! Its sides covered with silvery sheen, through which its stripes of black appear like the warp of a beautiful fabric, the woof of which is yet to be woven; the brilliancy of its colors, which is at its height when the fish is in full activity in its ocean home, is dimmed very considerably after it has entered the fresh or brackish water of rivers and ponds, and it also loses a share of the gaminess it possesses in its marine home.

Scientific Angling.

The perfection of bass angling is attained only by the angler who, by reason of long experience and practice, is enabled with rod and reel to cast his menhaden-baited hook from his standing place upon the surf-beaten cliffs or rocky shore afar into the ever throbbing waves.

My experience with this glorious fish has been varied, and has been acquired in many localities, and as I recall the incidents of more than one hard fought battle, my fingers involuntarily clutch at rod and reel, and I can in fancy behold the beautiful silvery sides of a vigorous fish that has taken my lure and is darting with almost electric speed through the briny deep. There is no other angling that compares with it so far as fierce and strenuous resistance from the fish is concerned, except, possibly, that which is enjoyed in the great rivers by the salmon fishermen; between the methods of angling for these two fish there is hardly any comparison, for the conditions under which they are pursued are diametrically opposite.

Salmon vs. Bass Angling.

The salmon rivers are almost always picturesque, and their forest-covered shores from which come the songs of birds and the perfume of thousands of fragrant wild flowers, appeal to all there is of the æsthetic in the nature of the angler, the ever-varying mood of the water, from the dashing, foaming rapids to the comparative tranquillity of the deep, broad pools, also add their charms, and it is all these, together with the peculiar characteristics of the fish, which make salmon angling one of the most royal of sports.

The angler for striped bass casts his lure amid different surroundings; the vigorous sea breezes full of life-giving ozone wafts to his ears no songs of bird; he hears only the roaring of the tumultuous surf, and sees nothing before him but a broad expanse of ever restless water. I am referring only to those anglers who follow the bass in the most approved methods, still-fishing from boats being different in every way. It is true that the latter practice is very popular, perhaps more so than is the other, but the fish average much smaller in size, and consequently do not furnish anything like as grand sport.

It is very true that a two or three-pound bass on light tackle gives good play, and when the fish are biting freely they furnish an exhilarating recreation that often becomes quite exciting; but think of what a battle a twenty-pounder puts up! His strength is something wonderful, and his stubbornness and endurance are almost beyond compare; his long and rapid runs are excelled by those of no other fish, and had he the saltatory powers possessed by the salmon, he would unquestionably be crowned the king of American game fish,

My fortune has never been so beneficent as to permit me to take one of these that exceeded thirty pounds in weight, and I have often envied those anglers who can boast of their forty and fifty-pound bass; those must have given a battle royal, indeed; but what would the struggle be with a hundred-pound fish, such as is spoken of in Mr. Scott's book on angling?

An Exciting Contest.

As I recall the incidents of many a hard fought contest, the recollection of an encounter I once had with an eighteen-pound fish comes back to memory most vividly, and it seems to me now it was among the proudest achievements ever vouchsafed me with rod and reel. I was fishing for tautog at Eastern Point, Gloucester, Mass., that bold and rocky cliff upon which the surf dashes, oftentimes with a roar like thunder. My tackle was not well adapted to the capture of so large a fish, and I have often wondered at my success in saving him. My rod was a pretty stiff bait rod, such as I often used in tautog fishing, which at that time was very satisfactory at that place; it was of good lancewood throughout; fortunately for me, this was many years ago before the split bamboo came into general use, but I would not dare to pit it against an eighteen-pound bass nowadays. Luckily I had my salmon reel and a hundred yards of line, or I could never have withstood the fierce runs my fish made before he was conquered. My bait was a small crab, such as is usually used in tautog fishing, and I had given it a long cast out beyond the dashing surf. As I was withdrawing it, I felt a strong tug at my line quite different from the bite of a tautog, which, no matter how large the fish may be, is at first rather perfunctory. By tautog I mean that species taken off Staten Island, Long Island, and in the Sound, commonly called the blackfish, and when the first dash was made, as I struck the hook well home, I saw at once that I was fast to one of my old favorites, and a good one at that. For a good half hour I literally had my hands full with that fish, for the rod was not heavy enough to permit me to check him very severely in his wild runs, and I was so unfortunate as to have only a small shelf on the rock to stand on, upon which the wild surf, that increased in volume with the strong breeze that was blowing, dashed with such force as to throw the spray completely over me in drenching showers. The runs that fish was able to make were wild ones, indeed, and they caused my old salmon reel to sing vociferously. Down deep in the water he ranged far and wide, and had he leaped above the surface, as would a salmon, the excitement of the struggle would have been greatly increased; for I hold that it is the leaping fish which furnishes the most exciting sport, and many of my brother anglers will no doubt agree with me that if the salmon, grilse, ouaniche, or other landlocked species of salmonidæ, always fought doggedly below the surface of the water, a large share of the sport that is derived from their pursuit would be lost.

Leaping Fish give the best Sport.

This view of the matter I expressed to a gentleman in New York a few weeks ago, who is probably one of the most expert and experienced striped bass anglers in America, and he agreed with me, practically declaring that the greatest sport was to be had with the barracuda, a salt-water species that attains a weight of twenty or thirty pounds or more, and which, notwithstanding that size, leaps so frequently after it has taken the hook that it seems to be out of the water fully as much as it is beneath the surface. I never had any experience with that fish whatever; in fact, I do not remember ever having seen it. My bass was a very strong, vigorous fish, and I soon became convinced that, providing the hook held, my only chance for success in landing him would come solely after a protracted struggle, and protracted it was, indeed; the minutes seemed to lengthen into hours before he relaxed his efforts and slowly came to the surface, where, after a few faltering struggles, he remained upon his side, offering but a feeble resistance to my efforts to reel in my line. At that moment the question came to my mind how I was to land him, for I was alone, and my landing net, even if I could use it and handle him, too, would not be large enough to encircle him; there was nobody in sight or hearing, but I wanted to save that fish if I possibly could; and so clambering along the rock in the midst of the drenching surf, I led my captive gently and cautiously, keeping him away from the rock weed which grew abundantly from those ledges, until I reached a depression or basin whose edge was but a little above the waves, and into this, taking advantage of a comber upon whose crest the captive lay, I dragged the bass; but even then he nearly regained his freedom, for as he landed in the shallow basin the hook sprang from his mouth, and to save him I was forced to throw myself upon him bodily, and seizing him by the gills, I held him securely until he was conquered. Ah, what a beauty he was, and what a monster he seemed beside the pair of three-pound tautog that I had taken a short time before!

Baits and Methods of Using Them.

Now, to cast the bait with rod and reel requires no small degree of patience; it is not in every hour of the day that big bass are to be found, and the angler is sometimes forced to cast his lure throughout a whole tide before it is accepted, and not only this, most of the good localities from which such casting can be made are pretty generally preempted by such clubs as the Cuttyhunk, etc., with whom bass angling has become what might be termed a fine art. The general angler, therefore, is obliged to pursue his sport from a boat, and, fortunately for him, there are very many localities where success may be had.

On more than one occasion I have enjoyed in a very high degree the exhilarating sport that I obtained in trolling for bass with squid, artificial minnows, and even a spinning spoon. It is almost always a free biting fish, and takes the bait with considerable vigor as it moves through the water behind a yacht or sailboat. While it is not as fierce a fighter as the bluefish, when it is hooked on the troll it gives very lively play, and if the fish are reasonably abundant, two or three rods in the boat—and I greatly prefer the use of the rod to the hand-line—will be kept pretty busily employed.

I have also had no little sport in still-fishing from a boat that was anchored in a tideway or over a reef or near a rocky shore, the bait used being a piece of lobster or shedder crab, a small sand eel, and when smaller fish were running, shrimp or minnow bait proved very successful. But although these methods creeded the largest number of fish, they averaged rather small in size, and were not much more gamy than the squeteague, even if they did display as much vigor as that fish usually shows. And not only that, my preference has always been for the use of the rod and reel in casting; still-bait-fishing being, as a general thing, rather pottering and tedious sport. It is true, there are hundreds who enjoy it, and many of them, perhaps, would not care to do so even if they had the opportunity to cast from surf-beaten shores; they would not enjoy a sport which entails a very considerable amount of hard work.

More than once have I been on the rocks casting, hour after hour, without obtaining a single fish, and whole days even have sometimes been blank; but when a good fish was struck and successfully played and landed, I felt very much more than repaid for the labor I had expended.

In Fresh Water.

The striped bass, unlike the bluefish, squeteague, and a number of other marine species, leave the salt water for brackish estuaries of rivers, even ascending the latter sometimes for a considerable distance to lakes or ponds where they spawn and pass the winter in a state of semi-hibernation; there are many localities on the coast where the bass have entered the fresh water and taken up permanent homes in them; but after they have become thus domiciled, they lose much of their beautiful metallic lustre, and the gaminess which they display in their ocean homes.

I have a friend who has taken with rod and line a considerable number of these fish in fresh water; using smelts or minnows for bait, and he declares that they are sluggish in the highest degree, being not nearly as strong and lively as an ordinary codfish, as he expressed it.

While ordinarily they leave the fresh water in the spring and return to the ocean, they are obliged, in some instances, by the action of the elements, to remain during the entire summer and ensuing fall and winter away from their natural habitats.

At Little Harbor, which is ten or twelve miles distant from the quaint little town of Lockeport, Nova Scotia—which town I would say for the benefit of visiting anglers, is reached by steamer from Boston to Yarmouth, rail from Yarmouth to Barrington, and thence by stage through Shelbourne and a very picturesque country to Lockeport—is a lake two or three miles in length, and about a mile or more in breadth; its water is brackish, owing to its very near proximity to the sea. Between this lake and the harbor there is annually cast up in the spring by the high tides a barrier of sand, which very often effectually dams the water of the lake. During the fierce storms of autumn, the tide beats with resistless force upon this barrier, sweeping it away, so that the bass have free ingress to the quiet waters within, and they take advantage of this opportunity, entering the peaceful haven in very great numbers and remaining there through the winter. In the early spring the tides again throw up another barrier which remains throughout the summer unless the water in the lake by reason of heavy freshets rises high enough to force an opening through the sandbar. Through this opening a river of considerable size carries the water into the bay, and by means of this channel the bass escape; few, if any, remaining in the lake during the summer.

Landlocked Bass.

But if the water in the lake is not high enough in the spring to break through the sandy dam, the fish remain

landlocked throughout the summer. When in this condition they do not take bait very freely, for there seems to be an abundance of food, such as smelts, young bass, and minnows, in the lake, and they rarely come to the fly, although a sportsman occasionally takes one with that lure.

Last summer they were landlocked during the entire season, and some of the people in the neighborhood captured a considerable number of very large fish in the shoal water below the lake where the bass were endeavoring to escape to the sea, the large fish ranging in weight all the way from eighteen to thirty pounds.

The water in the lake rose very high during the freshets of last May, forcing a deep, broad opening in the sandy barrier through which the bass freely passed into the salt water; so completely was it denuded of fish that during a recent visit to it after careful and persistent efforts with flies, trolling spoons, and phantom minnows, I failed to discover a single bass.

Mr. Scott, in his book on angling, in speaking of this habit of the bass, states that a number of years ago the ponds formed by the back water of the Seconnet River were so full of striped bass that the fish were discovered by their dorsal fins in the ice, where they had been frozen by too close packing. The ice was cut, and hundreds of cartloads were pitched out with forks and taken to market.

EDWARD A. SAMUELS.

Fish and Fishing.

Salmon, Ouananiche and Trout.

MANY mixed baskets of fish have been reported by anglers from time to time, and both in Europe and in America I have fished waters that yielded half a dozen or more varieties, such as are sought by anglers. In Britain, of course, sportsmen go a-fishing for species that American anglers—spoiled by the abundance of the grandest of game fishes—would not look at, and if by accident they should find their flies or bait taken by coarse fish, they would simply throw them back into the water in disgust.

Perch, ruffe, pike, chub, gudgeon and eels have all come to my creel out of one small stream within half a dozen miles of Izaak Walton's birthplace, and I can call to mind long morning walks and many patient hours spent in the often vain endeavor to entice two-pound chub, such as in northern Canada will often persist, in the most aggravating manner, in rising to one's trout flies when they are not wanted.

Mixed bags of game fish are frequent in this country. In the maskinongé waters of Canada, it is by no means uncommon to take bass, maskinongé and whitefish in the same lake or river, and sometimes there are also trout to be had there, for a time at least. Trolling in Lake St. John will often produce a mixed bag of pike and ouananiche, and in some parts of the lake, and especially in the rivers flowing into it, I have taken ouananiche, trout, pike and doré or pike-perch, in the same day's fishing. Salmon and trout make a mixed bag by no means to be despised in the later part of the salmon season, when the fresh-run sea trout are in the salmon pool, though it is extremely annoying to have one's salmon flies destroyed by the hard biting and ferocious trout, and a salmon pool spoilt for the remainder of the evening when one is angling for the larger fish. Even when the water is clear, it is not always very easy, unless one is exceedingly watchful, to snatch his salmon fly off the pool before it can be seized by a four or five-pound trout, for in fishing for salmon, it is customary to let the fly sink a little beneath the surface of the water, and when one is all intent upon watching the newly cast fly, a big trout may easily dart up and seize it in quicker time than the average angler requires, under such circumstances, to withdraw his lure. In its proper place this sea-trout fishing is by no means to be despised, and I know several salmon fishermen who make it a point to spend a few days in the estuary of their river, enjoying it.

Some of the salmon fishermen whose rivers are on the north shore of the St. Lawrence have been able to make a mixed bag of the three gamest of the game fishes of fresh water—salmon, ouananiche and trout. I know that the ouananiche run in some of these streams, as well as in several of the Newfoundland rivers. I have just heard of the capture of some in the Eternity, a tributary of the Saguenay, flowing into Eternity Bay.

Salmon fishermen who can get good ouananiche and trout fishing this year are, as a rule, taking it, for not many of them are doing much in the way of salmon fishing. Friends of mine who fished the Trinity have returned home and reported killing only a little over thirty fish, though the score of the river is usually over a hundred. The fish were fairly plentiful in this stream, but the condition of the water was wrong almost all the season. In some of the smaller rivers, the water was exceptionally low and the fish very few and difficult to rise. From the Miramichi and other New Brunswick rivers come the same story of very poor fishing. On the Marguerite, the fishermen cast steadily for nearly three weeks without doing scarcely anything. Hardly ever before have the pools of this river shown up so badly as this year. The higher tributaries of the Saguenay have not done much better. I am by no means sure, however, that notwithstanding the lateness of the season, there may not be better salmon fishing yet than any that has been this season. It was not till about the 8th of July that the first salmon of the season showed up in the mouths of the rivers at Ha! Ha! Bay. In the Eternity River, nearly a week later, the fish had only ascended two miles from the mouth of the stream. The first fish had only reached the Bridge Pool, four miles higher up the river, on the 16th inst. I have a letter before me, written upon that date, which brings the tidings that the water is in excellent shape, and that rains have raised the river considerably. It is because I am under the impression that the condition of the water in other rivers has similarly improved, and that there will be a later run of fish in them in consequence, that I anticipate better fishing before the season ends.

Other Fishing Good.

The reports from the trout fishermen are as good as those from the salmon anglers are bad. Ex-Senator Edmunds has gone home from a very successful visit to the preserves of the Metabetchouan Fish and Game Club between Quebec and Lake St. John. Mr. Edmunds was accompanied by General Henry, U. S. Consul at Quebec, who killed the biggest trout, one of nearly two pounds in weight, which was taken on the fly nearly opposite to the club house at Kiskisink. The largest number of fish were taken in the Metabetchouan River.

Exceptionally good trout fishing is also reported both from Lake Kenogami and also from some of the smaller lakes south of it as well as in the Boivin River. A party of American anglers made a heavy catch of trout here in the first week of July, notwithstanding that the weather was very hot.

From the Grand Discharge good reports of ouananiche fishing continue to arrive. Recent rains came just in time to prevent the water growing hot and low. Anglers have not yet found it necessary to descend the Discharge for good fishing beyond the pools at the foot of the Grand Chute, formerly known as Griffiths'.

When Trout Will Not Feed.

Observation convinced me long ago, and subsequent experience has justified the conviction, that there are times when trout, no matter how plentiful they may be, will not take a lure at all, being entirely off the feed. A case in point occurred to me only a few weeks ago. At the mouth of a large lake where I was fishing is a disused dam. In the outlet immediately below it is a clear pool containing hundreds of brook trout of various sizes, from three-quarters of a pound down to fingerlings. The pool is too far from civilization to be much fished. Not half a dozen people visit it in the course of a year. I fished it three evenings in succession. On both the first and the third evenings I had wonderful sport. No matter what fly was offered, the fish took it freely, and after returning to the water nearly two dozen small trout on each occasion, I took back to camp, for supper and breakfast, over a dozen good fish. The water was so clear on both occasions that the fish could always be seen rising to the fly. Nor were they at all shy, but would rise almost at my very feet. On the second evening there were apparently as many fish in the pool as on both the preceding and succeeding evenings. The weather was apparently as favorable for fishing as on either of the other two nights. The fish were wonderfully active, but apparently in no way frightened. They were simply playful, swimming gaily about the pool, rising to the surface and then descending, without apparently sucking in any surface food but just stirring a ripple upon the water. Never a fly would they take, however. I changed the cast nearly a dozen times, but all to no avail. Generally they took no notice of the flies at all. Sometimes, however, they would rise to examine them, but not one of them took the lure at all. I tried bait, but it was of avail. One little fellow, which was returned to the water, took it, and that was all. It was impossible to account for such a failure. The fish were there, but apparently they were not hungry and would not feed. I took no more precautions in approaching the pool upon the two nights when I was so successful, than I did upon the blank evening. Had the fish appeared frightened, I should have come to the conclusion at once that the pool had been recently disturbed by some trout-eating animal or bird; but on the contrary the fish appeared perfectly at their ease. It was a puzzle and must remain so, I suppose, but it is by no means the first one of its kind that has occurred to me. Very often the fish would rise all around the flies without touching them.

Canadian Government and the Dogfish.

At last the Dominion Government has been spurred into action in the matter of the dogfish scourge, by the bitter reports of the doings of these pests. The Hon. Raymond Prefontaine, Minister of Fisheries, has announced in Parliament in reply to a question made a few days ago, that the government will subsidize an industry for the purpose of rendering down the fish for their oil, and to make fertilizers of the refuse. Further details of the government measure are not yet forthcoming, but it is hoped that the subsidy will be sufficiently large to insure the success of the industry, without which it cannot be maintained. It is claimed that joint action will be necessary on the part of the American Government if any great result is to be achieved in the matter.

Heavy on the Line.

Colonel Scott, of Roberval, was one of a party engaged in discussing fishing of various kinds the other day. Speaking of the resisting power of different fishes, the Colonel described the desperate time he once had bringing in his line with something of great resistance at the other end. He could not imagine until the fish came in sight what he had hooked. Then it transpired that he had caught an enormous eel of some six feet in length, which, in endeavoring to wriggle itself off his hook, had only succeeded in twining itself about until it had caught its tail upon one of the Colonel's other hooks. Hooked by both head and tail, the big eel thus formed a great loop in the water, and accounted for the resistance it was able to offer to the angler's efforts.

Soles and Heels.

The son of the former Governor-General tells of an experience which occurred to him. Entering a London restaurant, with a well-known wit, he inquired what fish were upon the menu that day. "Soles and heels," was the reply. "But we cannot eat shoe leather, you know!" replied the wag.

E. T. D. CHAMBERS.

St. Lawrence River Angling.

TORONTO, July 18.—*Editor Forest and Stream:* This season a fee of \$5 a rod is required from all Americans fishing on this side of the boundary line who are stopping at American hotels, and who merely cross for the day's fishing, returning at night; and also from those who visit Canadian waters upon their yachts, having obtained their supplies at American ports. Where they obtain their supplies at Canadian ports, the fee is not exacted. We had thought of putting up the fee to \$10 a rod, but it will remain at \$5 for the present year.

Permits for the St. Lawrence and tributary waters may be obtained from the following persons: D. Cattinach, Wolfe Island; W. H. Godwin, Kingston; John Driscoll, D'Arcy; G. M. Beecher, Brockville; W. Craig, Glenburnie; O. V. Goulette, Gananoque; F. Williams, Rockport; W. H. Shaver, Prescott; J. R. Gibson, Mallorytown; J. C. Judd, Morton; John Roddick, Lyndhurst; I. Blondin, Cornwall; or from the department direct.

We are spending thousands of dollars in the protection of our St. Lawrence fisheries, and where Americans enjoy this fishing, and are contributing nothing to the support of our institutions, we have thought it proper that they should pay this small fee.

We are prohibiting the sale and exportation of bass, maskinongé, and speckled trout, but the Americans returning with their catch, I am informed, dispose of these, or give them to the guides, who sell them. This, of course, we have no power to prevent, though I have from time to time taken up the matter with the American authorities with a view to the adoption of a similar law on their side.

With regard to the St. Lawrence, it is said that American yachts will come into our waters with as many as ten or fifteen rowboats in tow, will fish all day and pay no regard whatever to our regulations as to the number that may be caught or the size thereof, and that if a boat happens to contain two or three parties who are not fishing, the person fishing will continue until he takes the legal complement, as if each person were fishing; and in this way will take as many as forty, fifty, and even sixty bass in a day. Our regulations provide that eight bass only can be taken by any one person in a day.

I remember reading an article in *FOREST AND STREAM* a year or two ago, over the name of Mr. Wolcott, in which he said that the guides had found the business very profitable, as they received the majority of the bass taken, which they sold, "one of them having made several hundreds of dollars from this source this summer." Only recently I have been informed that bass from Canadian waters have been openly peddled in the streets of Clayton and Alexandria Bay.

We have been obliged this year to require Americans who are stopping at our hotels, and who desire to take home with them a sample of their catch, to take out an angling permit. The fee, however, for this permit is nominal, \$1 only being charged. The legal catch of two days may be taken home, but must be accompanied by the angler, and a coupon will be furnished, which must be placed upon the box. We had found that parties fishing here were in the habit of sending home their catch every few days, and these were sold, and in this way they realized their expenses. Tons of fish were thus disposed of.

A. T. BASTEDO,
Deputy Commissioner.

In Colorado Waters.

DENVER, Colo., July 22.—Anglers all over the State are highly elated at the decision of Judge Theron Stevens of the Seventh Judicial District Court, who makes the sweeping declaration that all meandering streams of the State are the property of the people, who have absolute right to fish them so long as they confine themselves to the bed of the stream.

The decision is the outgrowth of a suit brought by Alonzo Hartman, of Gunnison, against Geo. Trezize, who persisted in taking fish from a stretch of the Gunnison some six miles long which the aforesaid Mr. Hartman had fenced in and claimed to own. The merits of his claim were not gone into, Judge Stevens deciding that no trespass had been committed, and that none can be committed so long as the angler confined himself "within the banks of the stream." His decision is based upon a statutory law reading: "The water of every natural stream not heretofore appropriated within the State is hereby declared to be the property of the people, and the same is dedicated to the use of the people of the State, subject to appropriation as heretofore provided."

Fish Commissioner J. M. Woodard thinks the decision will stand the test of the higher courts, and says it will result in throwing open hundreds of miles of fine fishing territory heretofore zealously and jealously guarded from the public, in many cases without a shadow of legal right. He cited as a case in point one owner of a fishing camp on the Gunnison who bought three-fourths mile of land on that grandest of trout streams, but fenced in four miles, and allows none but such as become his guests at \$3 a day to invade the grounds.

The Rio Grande Railroad is running its cheap weekly summer excursions to all points on the Gunnison, and every fishing camp in that favored section is well patronized. Since the willow fly disappeared two weeks ago, the fat old lunkers have become more than epicurean in their tastes, and refuse every thing but the little stone fly, which abounds in myriads, and its prototype, the ginger grill, on No. 10 and No. 12 hooks, or even No. 14. They are also beginning to take notice of the blue grill midge. It is great fun, but doubly delicate work to play and kill five and eight-pounders on such frail tackle. One Denver gentleman who is too modest to look at his name in print, killed three seven-pounders, one six-pounder, and two five-pounders with this first named fly. Pretty fair day's work, eh? But, strange to say, no one has so far captured a ten-pounder from a running stream.

For near-by fishing, Billy Welsh's camp, four miles north of Lyons, on the St. Vrain, fifty-five miles from Denver, makes the best showing. G. Gordon Pickett came down last Monday morning with nineteen which ran from ten to twelve inches. Their weight wavered between three-fourths and one pound.

Good reports come to me from Strontia Springs, Mill Gulch, South Platte, Baileys, Estabrook, and Buffalo, all on Platte Cañon, and two or three hours' ride from this city. Catches of from twenty to thirty are of frequent occurrence, and the saucy rainbows are now striking with great avidity.

In contradistinction to catches of one, two and three score, is the catch of Judge D. C. Beaman, who came down from Twin Lakes last Monday morning with four Mackinaws as the result of two days' work. He had 'em in a sugar sack. In a burst of confidence he told a friend—a local judge—of his fine sport, and the latter put Fish Commissioner Woodard next to the fact that the sack contained forty-three pounds of trout, or eighteen pounds over the limit. Warden Woodard, who has caused a number of prominent (?) citizens to be heavily fined for taking over the limit and under sized trout this season, entered into the spirit of the prank and managed to keep the sun-bronzed and youthful old sportsman on Uneasy street for half an hour. Not until he had explained that his catch was the result of two days' work and the efforts of two seasoned old anglers, did the jokers desist.

Judge Beaman, Tyson S. Dines, and the latter's fourteen-year-old son, Courtland, spent a couple of weeks at Aransas Pass, Texas, among the tarpons. Mr. Dines scored three kills—6 feet 2 inches, 5 feet 10 inches, and 5 feet 6 inches. Judge Beaman's best was 5 feet 3 inches, one somewhat smaller, and a 75-pound jewfish. Young Courtland Dines killed 115 sea trout, and all came back with a bronze that would fill an Indian's heart with envy.

J. D. C.

The Red Trout.

MANSONVILLE Que., July 22.—*Editor Forest and Stream*: I notice that in my article on "Salmon of the Moisie" that you make them average "over 341 pounds each," while my type-written copy plainly reads "over 24 pounds each."

Referring to the red trout, *S. oguassa marstonii*, mentioned by Mr. Chambers in your issue of the 16th inst., we believe that we were the first to call attention to these fish. See Hallock's Sportsmen's Gazetteer, where we mention catching them in Coon's Pond, a small mountain lake some 18 miles north from this village. We have recently made some fine catches of the same fish in Sugar Loaf Mountain Pond, seven miles from here. They average about one-third of a pound each, though two-pound specimens have been taken. We have also taken them from a few deep lakes of cold water north of Montreal, but have taken none over ¾ pound in weight. We formerly called them the "forked-tailed trout," as their tail is quite as forked as that of the common black sucker, and they spawn after the ice takes in all of the lakes where we have found them.

A farmer quite near here has two albino crows which are pure white, with perhaps a slight tinge of a yellowish cast, and are very tame.

Some boys who recently visited the top of Sugar Loaf Mountain, which is very steep and precipitous in most places, found on its very top where a couple of sheep had been eaten, as their wool and bones were scattered around under some small spruces. What animal would be likely to carry them up there, over a mile from a pasture where sheep are kept? There are a few bears in the vicinity and an occasional panther.

STANSTEAD.

Susquehanna River Angling Notes.

SAYRE, Pa., July 22.—Excellent bass fishing is now being enjoyed by the devotees of this branch of angling. At Wyalusing, where the waters of the Susquehanna flow deep and wide, the bass have been biting freely, and many fine baskets of black bass have been taken. There is a breadth of water and a beauty of environment at Wyalusing which serve to please and satisfy the most exacting angler. The excellent bass fishing afforded by the Susquehanna is not confined, however, to Wyalusing. Beginning at Rummelfield and continuing past Wyalusing to Standing Stone, the fishing is unexcelled. Between Athens and Towanda some nice catches of black bass have been reported during the past fortnight. Reports also indicate that between Sayre and Owego, and for some miles beyond the latter village, the Susquehanna is furnishing the bass fisherman good sport.

The question has recently been brought up, if the carp now inhabiting the Susquehanna at points toward the source of the river will not increase and eventually ruin the bass fishing. At Unadilla, N. Y., the other day, a citizen of the village took a 30-pound carp from the Susquehanna, and at various points in that section of country the river fishermen have taken a large number of carp, and it is the consensus of opinion that the "mud grovelers" are increasing rapidly, and promise to infest the length of the noble river famed from primitive days for its bass fishing. While it is contended by many well-informed people that this danger is more apparent than real, the fact is nevertheless true that the carp pest has practically destroyed many waters where the natural conditions were fully as inimical to the development of the fish as they are said to be in the Susquehanna. Moreover, to rid these waters of the pest is a far different problem than that connected with eliminating it from a body of water which may be emptied at any time the owner or public may elect.

Between Sayre and Owego some excellent pike, both in respect to size and flavor, are being caught. Locally these pike are known as yellow bass, but they are every inch a pike, and they give the angler, as a rule, a smart turn of sport.

M. CHILL.

Uniform Laws for New York and Ontario.

THE New York Legislature adopted a resolution providing for a joint committee from the Assembly and Senate, who with the Commissioner of Forest, Fish and Game, are authorized to negotiate with the State of Vermont and the Province of Ontario, in relation to the adoption by the governments having jurisdiction over the waters of Lake Champlain of a uniform plan of fish protection in the lake; and with the Province of Ontario for a uniform plan of fish protection in the waters of Lake Ontario and the rivers forming a boundary between New York and Ontario.

The committee will consist of Senators Spencer G. Pruyn, of Upper Jay, Essex county; Thos. H. Cullen, of Brooklyn; Assemblymen H. Wallace Knapp, of Mooers, Clinton county, and Willis A. Reeve, of Patchogue, Suffolk county, together with the Forest, Fish and Game Commissioner. It is very likely that the Commissioner will designate Mr. J. Warren Pond, the Chief Protector, to act in his place on the committee. The committee is to make its report by January 1, 1905.

Weakfish in the Hudson.

OSSINING, N. Y., July 23.—*Editor Forest and Stream*: Since my communication to you about the scarcity of salt-water fish in the Hudson, in which I attributed the present dearth to changed conditions of the water owing to the presence of gas tar and chemical waste, we have had the finest run of weakfish here that has been seen for many a year. Dozens of messes have been caught within the last two weeks of ten and over which would average 2½ pounds. I was out on the 23d to try my luck, but an east wind prevailed which had evidently driven them off into deep water. Twenty-six boats were on the reef and oyster beds, but only two of them got any weakfish, seven to one boat and three to another. These fish are likely to stay here all summer unless we have a long rainy spell. While rowing in I came through a patch of gas house oil from our local manufactory which would cover a dozen acres, and in the whole expanse not a fish flipped through the nasty blanket which covered their play ground.

C. G. BLANDFORD.

Sunapee Fish are Puzzlers.

SUNAPEE LAKE, N. H., June 21.—*Editor Forest and Stream*: We have spent three seasons on Sunapee Lake, N. H. The lake is swarming with large fish which can be seen at spawning time. We are not expert fishermen in fresh water, and this lake especially puzzles the average. Could you suggest some way to try? We thought to try gold fish. If you care to give this your attention, you will please a constant reader, and also possibly open up fishing in one of the finest lakes in the East. How about baiting a place, and what with? I would like an answer on this water specially, as we imagine it differs from any others, having no inlet, and the Sunapee trout is reputed to be the only specimen of its kind. W. C. R.

"Pike," "Jack Salmon."

BUFFALO, N. Y., July 18.—*Editor Forest and Stream*: I have just finished reading Charles Cristadoro's account of "Playing a Musky to the Gallery." He says the taxidermist who mounted the fish called it a jack salmon. In some sections of the country the wall-eyed pike is called jack salmon, but I never heard that name applied in Wisconsin. But how could anyone confuse a wall-eyed pike with a member of the pike family? They are so entirely different in structure. The two dorsal fins on the wall-eyed pike would alone mark the difference.

Jackfish is a name sometimes applied to the common pike (*Esox lucius*). Speaking of local names of fishes, it is very noticeable along the Niagara what a strong hold they have on the local fishermen. I have had many arguments with them over the names they give to the wall-eyed pike. They will not be convinced that blue pike, yellow pike, and gray pike are different names for the same species—wall-eyed pike. The latter term is almost never used along the river here.

DIXMONT.

All communications for FOREST AND STREAM must be directed to Forest and Stream Pub. Co., New York, to receive attention. We have no other office.

Larchmont Y. C. Race Week.

Larchmont, Long Island Sound—Monday, July 18.

THE racing on Monday was not very satisfactory. The skippers and crews of the thirty-four boats that started had a long, tiresome day.

The start was made just after noon, and at that time there was a very fair sailing breeze from the N.W. It soon lost its strength, however, and the boats encountered many calm spots.

The preparatory was given at noon, and five minutes later the two boats in Class I were sent away. Weetamoe crossed in the lead. Neola was close behind. Mr. Henry F. Lippitt handled his own boat, Weetamoe, while Mr. Wilmer Hanan was in charge of Neola. The course for the "sixties" was from the starting line to a mark in Hempstead, thence to the easterly mark and back to the starting line, a distance of 15 miles. This triangle was to have been covered twice, but owing to the fickleness of the wind, the boats were stopped at the end of the first round. Neola worked into the lead, and at the second mark had a lead of over half a minute. The first and second legs were reaches, and the third was a beat. On the windward leg the two skippers' skill was given a sore test, as the wind was very light, and the progress necessarily slow. When near the finish Weetamoe was brought up in the wind as if to tack, and Neola was brought about at once. Weetamoe filled away again, and through this move was able to cross Neola's bow, and won the race by 1m. 13s.

Boats in Class M were the next largest craft to start, and they got away at 12:15. There were three starters, and Anotok, sailed by Mr. Hazen Morse, showed up to better advantage than she has at any other time this season. These covered an 11-mile triangle twice. Spasm and Mimosa III, had a luffing match on the first leg, and Anotok, having no interference, opened up a good lead. At the end of the first round she was leading by 3m., and Spasm was 1m. 22s. ahead of Mimosa III. On the second round Anotok increased her lead, and won by nearly half an hour. Spasm finished over 10m. ahead of Mimosa III.

In Class N, Alert had only one competitor, Chewink, which boat she beat easily. At the end of the first round Alert led by 6m. 24s. Chewink cut down this lead on the second round, but Alert won by over 4m. These boats sailed twice over the 11-mile triangle.

At 12:25 the seven starters in the raceabout class got away. They went over an 11-mile course. At the end of the first round the Kid was leading; Hobo was second, Tartan third and Rascal fourth. On the second round the positions were changed. Rascal worked into first place and won by 3m. 31s. The Kid was second and Hobo was third.

The Larchmont one-design boats covered the 5½-mile triangle twice, and Hourai won from Dorothy with nearly 3m. to spare. Vaquero II. was third.

The racing between Una and Rogue was fairly close, although Una had a shade the better of the contest throughout. She won by 1m. 33s.

In Class Q, Snapper secured the lead, which she increased throughout the race, and won by a large margin.

Of the three 18ft. knockabouts Miss Modesty had the best of it, and finding the conditions to her liking, beat Mirage, the second boat, with ease.

Wa Wa had things pretty much her own way in the Indian Harbor one-design class, and at the finish was leading by over 5m. Anawanda was a poor third.

Skip won in Class R. Ace beat Caper in the New Rochelle one-design class. Arizona had an easy time beating Chichiocker in the Manhasset Bay one-design class. The summary:

Sloops—Class I—Course 15 Miles—Start, 12:05.		
	Finish.	Elapsed.
Weetamoe, H. F. Lippitt.....	3 12 54	3 07 54
Neola, G. M. Pynchon.....	3 14 07	3 09 07
Sloops—Class M—Course 22 Miles—Start 12:15.		
Spasm, E. D. King.....	5 49 03	5 34 03
Anotok, W. G. Brokaw.....	5 50 30	5 05 30
Mimosa III, T. L. Park.....	5 59 10	5 44 10
Sloops—Class N—Course 22 Miles—Start 12:20.		
Alert, J. W. Alker.....	6 00 11	5 40 11
Chewink II, E. R. Dick.....	6 04 18	5 44 18
Raceabouts—Course 11 Miles—Start 12:25.		
Rascal II, S. C. Hopkins.....	3 35 41	3 10 41
Hobo, T. L. Park.....	3 39 34	3 14 34
Busy Bee, R. T. Wainwright.....	3 44 12	3 19 12
Tartan, A. H. Pirie.....	3 41 54	3 16 54
The Kid, O. Harriman.....	3 39 12	3 14 12

Tomboy, H. L. Maxwell.....	3 41 05	3 16 05
Idler, O'D. Iselin.....	3 40 01	3 21 01

Larchmont One-Design Class—Course 11 Miles—Start, 12:30.		
Adelaide, J. J. Dwyer.....	3 55 35	3 25 35
Hourai, J. H. Esser.....	3 46 33	3 16 33
Dorothy, L. G. Spence.....	3 49 06	3 19 06
Vaquero II, J. H. Marble.....	3 53 04	3 23 04

Sloops—Class P—Course 11 Miles—Start, 12:30.		
Rogue, A. B. Alley.....	3 44 11	3 14 11
Una, W. B. Duncan, Jr.....	3 42 38	3 12 38

Sloops—Class Q—Course 11 Miles—Start 12:30.		
Firefly, G. P. Granberry.....	4 04 53	3 34 53
Snapper, F. H. Page.....	3 55 12	3 25 12

Bridgeport 18ft. Knockabouts—Course 11 Miles—Start, 12:35.		
Miss Modesty, C. B. Seelcy.....	4 08 30	3 33 30
Question, N. W. Bishop.....	4 21 08	3 46 08
Mirage, J. P. Bartram.....	4 14 58	3 39 58

Indian Harbor One-Design Class—Course 11 Miles—Start, 12:35.		
Anawanda, E. C. Ray.....	4 43 18	4 13 18
Kenoshi, C. D. Mallory.....	4 22 21	3 47 21
Wa Wa, J. E. Montells.....	4 16 50	3 41 50

Sloops—Class R—Course 11 Miles—Start, 12:35.		
Skip, C. M. Pinkney.....	4 50 54	4 15 54
Gazabo, H. L. Vulte.....	4 56 27	4 21 27
New Rochelle One-Design Class—Course 11 Miles—Start, 12:40.		
Ace, Anna Bavier.....	4 46 13	4 06 13
Caper, P. L. Howard.....	4 53 11	4 13 11
Manhasset Bay One-Design Class—Course 11 Miles—Start, 12:40.		
Chichiocker, J. P. Mohr.....	5 24 09	4 44 09
Arizona, G. A. Corry.....	5 08 11	4 28 11

Tuesday, July 19.

The launch and gig races and the water sports were held on Tuesday, the third day of "race week." All the events on the programme, which was an elaborate one, were well contested. Ladies were admitted to the club house and the grounds, and the whole affair was brilliant and successful. In the evening the grounds were illuminated.

The results of the launch and gig races and the water sports follow:

Naphtha Launches Over 21ft.			
Start.	Finish.	Elapsed.	Corrected.
Alcacieenne.....	2 30 27	3 05 00	0 34 33
Vergemere.....	2 30 23	2 59 26	0 29 03
Sidonya.....	2 30 21	3 03 55	0 33 34
Alco Vapor Launches Under 21ft.			
Idalla.....	2 30 48	3 02 38	0 31 50
Naphtha Launches Under 21ft.			
Crusader II.....	2 45 53	3 23 13	0 37 20
Atlantic.....	2 45 14	3 18 48	0 33 34
Normona.....	2 45 25	3 23 17	0 37 52
Gas Engine Launches Under 21ft.			
Elsa II.....	3 15 18	3 50 59	0 35 41
Cachelot.....	3 15 22	3 51 01	0 35 39
Cara II.....	3 15 33	4 00 53	0 45 20

Four-oared gigs for the Hen and Chicken colors: Won by Katrina.

Pair-oared gigs for Dauntless colors: Won by Isolde; Crusader II. second, Weetamoe third, Alcacieenne fourth, Corinthia fifth, The Kid sixth, Hauoli seventh, Muriel eighth, Idalia ninth, Zara tenth.

Dinghies for Execution colors: Won by Cara II.; Hauoli second. Fifteen starters.

Swimming, 75yds., scratch: Won by C. M. Daniels; L. B. Goodwin second. Time, 52 1-5s.

Tub race: Won by Harold Warren; Butler Whiting second. Time 1m. 54s.

Swimming race, 300yds., scratch: Won by E. H. Adams. Time, 5m. 2 1-5s. F. A. Wenck second; time 5m. 13s.

Swimming race, 75yds., for boys, scratch: Won by C. M. Daniels; J. Crane second. Time, 52 3-5s.

Tilting contest: Won by H. T. Vulte.

Fancy diving: Won by F. A. Wenck; W. W. Swann second.

Obstacle canoe race: Won by W. W. Swann; H. T. Vulte second.

Water polo: Won by black team; Van Cleef, Beecroft, Grif-fing, Beechnoir, Bogart, Pallen. Score 1 goal to 0.

Wednesday, July 20.

Wednesday's race proved to be the best of the week. A fresh N.W. breeze held true throughout the day. With the wind from this quarter the water was smooth, and fast time was made by the boats over the several courses. The winners were Isolde, Weetamoe, Aspirant, Anokatok, Memory, Alert, Adelaide, Tartan, Una, Dorothy, Miss Modesty, Wa Wa, Gazabo, Scoot, Capar, Arizona, and Skidoo.

The larger boats went over a 10 1/2-mile triangle. The first leg was E.N.E., 3 miles, the second S. 3/4 miles, and the third leg N.W. 3/4 miles. The first leg was a close reach; the second was a run with spinnakers to starboard, and the last leg was a beat.

Boats in the special class and Class A covered this course three times, a distance of 3 3/4 miles. Boats in classes L, M, and N went over the course twice, a distance of 2 1/2 miles. All the other starters, with the exception of the Pelham Bay larks, covered a 1 1/2-mile course.

In the special class the starters were the cutter Isolde and the schooner Katrina. Isolde allowed Katrina 1m. 27s. Isolde was thoroughly at home in the strong breeze, and showed Katrina the way over the course, and won by nearly half an hour.

It was found necessary to withdraw Neola from the contest, as some of her rigging showed signs of weakness, and a fine race was spoiled in Class A.

Aspirant and Effort raced under a special allowance agreed upon by the owners of the respective boats. Aspirant allowed Effort 4m. 30s.. The former managed to save her time, and won by 26s. corrected time.

Chewink II. sailed in Class M, making four starters. Spasm broke her gaff, which put her out of the running, and Mimosa III. withdrew. Anokatok and Chewink II. were the only ones left, and the former had no trouble winning.

In Class M, for yawls, Memory, sailed by her former owner, Mr. R. N. Bavier, got all there was out of her and won handily. Tern was second, and this boat gave Sakana, the third starter, a bad beating.

Alert and Nike were the only contenders in Class N. Nike sailed a good race, and pushed Alert hard for first place. Alert won by 1m. 16s.

Adelaide had no competitor in the C. F. Herreshoff one-design class, and she took a sailover.

The ten starters in the raceabout class afforded fine sport. Tartan managed to win after a close race. Tomboy sprung her mast, and although she finished, she could not be driven. Maryola made the best showing so far this season, and got second place. Hobo was third.

Snapper sailed in Class P against Una and Rogue. She carried away her bowsprit in one of the strong puffs, and withdrew. Una again defeated Rogue easily.

The racing between Hourly and Adelaide for second place in the Larchmont one-design class was interesting. Hourly finally finished second. Dorothy won easily in this class.

Miss Modesty won again in the 18ft. knockabout class. Mirage was second.

In the Indian Harbor one-design class Owatonna was the only one of the four starters that did not finish. Wa Wa was placed first and Kenoshi was second.

There were three starters in Class Q. Gazabo got first prize, as she was the only one of the trio to finish.

Scoot took a sailover in Class R.

Capar turned tables on Ace and won out in the New Rochelle one-design class.

Arizona won in the Manhasset Bay one-design class, and Skidoo won in the lark class. The summary:

Class I—Sloops—Start, 12:05—Course 3 1/4 Miles.			
	Elapsed.	Corrected.	
Neola, G. W. Pyncheon.....	Did not finish.

Yellow Jacket, G. B. Robinson.....	Did not finish.		

Thursday, July 21.

Forty boats started in Thursday's contest, but out of that number only eleven were able to finish, due to the lightness of the wind. The time limit was up at 7:53, and at that time most of the boats were drifting around without steerageway.

The start was made as usual at noon, and at that hour there was a light S.W. breeze. Wind from this quarter generally holds during the summer afternoon, but it failed this time. However, before the wind gave out entirely, most of the craft had been once over their respective triangles. About 3 o'clock a little northerly breeze struck in, and the boats were sent around a second time. This proved a mistake, for the breeze did not last, and the entire fleet was soon becalmed.

Rear-Commodore Fred M. Hoyt offered a cup for auxiliaries. Vergemere and Atlantic started, but were forced to abandon the race, and resorted to steam power in order to get back to their anchorages.

Even in the classes where the boats finished, the results were not conclusive, for the racing was eminently unsatisfactory.

Weetamoe beat Neola by about 50m.

Vaquero was the only one of the three starters in the Larchmont one-design class to finish.

Tartan won in the raceabout; Rascal II. finished second and Maryola was third.

Una was beaten for the first time this season, by Rogue in Class P. The summaries:

Auxiliaries—Course 25 1/2 Miles—Start 12:55.			
	Finish.	Elapsed.	
Atlantic, W. Marshall.....	Did not finish.		
Vergemere, A. C. Bostwick.....	Did not finish.

Chickioker, J. P. Morgan.....	Did not finish.		
Wister, Dunstan Farnum.....	Did not finish.		

Friday, July 22.

The thirty-nine boats that started in Friday's race had plenty of wind to give them the liveliest kind of racing. The breeze was fresh from the E., and there was quite a jump of a sea on. During the afternoon a heavy rain squall worked itself off the Long Island shore and gave those on the boats a wetting. However, anything was preferable to the fluky conditions of Thursday.

Weetamoe and Neola were started at 11:35. They crossed the line abreast of one another, with Weetamoe in the weather berth. It was a beat to the first mark, and Neola managed to get out from under her opponent's lee. Weetamoe was first around the weather mark, and led around the second leg, which was a run, and the third leg, which was a reach. At the end of the first round Weetamoe led by 41s. On the second round Neola cut down Weetamoe's lead, but was unable to catch up with her. Weetamoe won by 19s. These boats sailed twice over a 15-mile triangle.

The next largest boats in the race were Aspirant and Effort. These craft sailed twice over an 11-mile triangle. The owners of the two boats agreed that Aspirant should allow Effort 5m. over the course. At the end of the first round Aspirant led by 4m. 8s. On the second round she increased this lead and won by 52s.

In Class M, Mimosa III. seemed to find again the speed she showed in her maiden race, for she won easily. Spasm was second and Anokatok was third. Chewink led over the starting line, but was soon passed by her rivals. At the end of the first round Spasm was pushing Mimosa III. hard for first place. The latter boat opened up a substantial lead on the second round.

The usual order of things underwent a change in Class N, and Bagherra, which boat made her first appearance in the Sound races this season, won. Nike was second and Alert last. Alert and Nike got in a luffing match, and when they finally straightened out on their course again, Bagherra had such a long lead she could not be overtaken.

The raceabouts started in a bunch, with Rascal II. in the lead, followed by Cricket, The Kid and Hobo, as named. Tartan worked into first place and won, The Kid being second and Hobo third.

Una managed to defeat Rogue again by over a minute in Class P.

Snapper and Firefly were specially matched, and the former won by over 3m.

Dorothy took another first in the Larchmont one-design class. Hourly was second.

In the Indian Harbor one-design class, Wa Wa won again. Kenoshi was second. Miss Modesty again beat Question and Mirage in the 18ft. knockabout class. The summary:

Sloops—Class I—Course 30 Miles—Start, 11:35.			
	Finish.	Elapsed.

Southern Gulf Coast Y. A. Circuit.

Mobile Y. C., Point Clear, Mobile Bay, Ala.—Saturday July 16.

The third of the six regattas of the racing circuit of the Southern Gulf Yachting Association to take place was that of the Mobile Y. C. over that club's triangular 5-mile course, which was sailed twice, or 10 miles in all. There was, as usual along this coast in summer time, a glorious 8 to 10 knot S.W. breeze. There was a large gathering of pleasure boats and excursion steamers in attendance, but the entries of yachts in the various classes was rather disappointing. Calypso, Invader and Katherine, all sloops, had sailovers in their respective classes. The small number of entries is accounted for from the fact that Mobile has not as yet been struck by the revival in the sport so noticeable farther to the westward on the coast and from the distance from the other clubs being so great. The next racing point in the series is at Biloxi, Miss., Saturday, July 23. The summary:

Cabin Sloops—Over 30ft. Rating.	Elapsed.	Corrected.
Calypso	1 53 01
Cabin Sloops—Under 30ft. Rating.	Elapsed.	Corrected.
Invader	1 55 39

Bensonhurst Y. C.

Bensonhurst, L. I.—Saturday, July 23.

The first of three handicap races for Bensonhurst Y. C. boats occurred on the afternoon of Saturday, July 23, over courses in Gravesend Bay. Ogeemah, scratch boat, easily carried off the honors in the sloop class, while Martha M. won the laurels among the catboats. Thirteen craft started and finished the race, sailing in two divisions according to rig, for cups presented by Commodore Arthur C. Bellows.

Handicaps were determined by the committee, past performances and other features effecting speed being taken into consideration. In the sloop class Ogeemah allowed Esperance and Dorothea 5m. each for the 8-mile course. Quinque got 7m.; India, Trio and Limit, 10m. each. Colleen was scratch among the catboats. She allowed Rosalie 7m.; Beth, 10m.; Orient, 2m., and Martha M., 30s.

The boats went twice over the regular association course, leaving all marks to starboard. In the light N. breeze blowing it was a run to the mark off Sea Gate, a reach with booms to port to Fort Hamilton, another reach to the Marine and Field Club mark and a close reach to the start off Ulmer Park. Ogeemah sailed very fast and finished long before the others. Martha M. was the second craft to end the race, the light air being much to her liking. The next handicap event for Bensonhurst boats is scheduled for August 6. The summaries follow:

Sloops—Mixed Class—Start, 3:15.	Finish.	Elapsed.	Corrected.
Ogeemah, Alfred Mackay.....	4 52 06	1 37 06	1 37 06
Cayuga, H. E. Cunningham.....	5 17 05	2 02 05	1 52 05
Indian, H. F. Menton.....	5 19 13	2 04 13	1 54 13
Esperance, T. A. Hamilton.....	5 17 02	2 02 20	1 57 02
Trio, Clarence H. Clayton.....	5 29 43	2 14 43	2 04 43
Dorothea, C. J. Dingens.....	5 30 00	2 15 00	2 10 00
Limit, Geo. C. Alyea.....	5 38 46	2 23 46	2 13 46
Quinque, McTighe and Knowles.....	5 41 40	2 26 40	2 19 40
Catboats—Mixed Class—Start, 3:20.	Finish.	Elapsed.	Corrected.
Martha M., Richard Moore.....	5 05 18	1 45 18	1 44 48
Colleen, W. F. Remmey.....	5 11 43	1 51 43	1 51 43
Orient, Richard Rummell.....	5 24 27	2 04 27	2 02 27
Rosalie, W. F. Bolles.....	5 37 43	2 11 43	2 03 43
Beth, H. F. Eggert.....	5 43 03	2 23 03	2 13 03

Rosalie started 6m. after gun. Her actual elapsed time was taken.

Atlantic Y. C.

Sea Gate, L. I.—Saturday, July 23.

EDGAR F. LUCKENBACH's Herreshoff 30-footer, Bobtail, won the second race for the Havens challenge cup, which occurred at the Atlantic Y. C. on the afternoon of Saturday, July 23. Bobtail was also the victor in the initial contest for the trophy, which was held on June 11. Under the conditions governing the cup, another victory before September 30 will give Bobtail permanent possession of the trophy, which becomes the property of the owner winning three races in any one season. W. H. Childs has challenged for the cup with his sloop Maydic (ex-Umbra). The date of the race will be decided later.

Eight craft started in the contest. There was a light breeze from the N. when the boats were sent away in one class on time allowance, according to measurement under the new rule. Vivian II. was scratch boat. She allowed Redwing 8s.; Bobtail, 3m. 38s.; Era, 3m. 45s.; Lizana, 14m.; Trouble, 15m. 48s.; Mary, 16m. 34s., and Wrath, 20m. 50s. The boats went twice over a 5-mile quadrilateral. It was a reach to Craven Shoal buoy, from the start off Sea Gate, with booms to port. Windward work brought the racers to the Fort Hamilton stake boat. A close reach with booms to starboard led to the Ulmer Park buoy. The journey from there home was a spinnaker run.

Bobtail assumed a lead at the beginning and was never headed. She defeated Vivian II., her nearest competitor, by 6m. and 52s. corrected time, and 3m. and 14s. elapsed time. During a greater part of the race the breeze was fickle and shifting. This caused a number of the starters to make showings inconsistent with past performances. The challenge cup is open for competition to Atlantic Y. C. boats in Classes M and under, and was offered this year by Rear-Commodore Edward B. Havens. The summaries:

Sloops—Mixed Class—Start, 3:00.	Finish.	Elapsed.	Corrected.
Bobtail, E. F. Luckenbach.....	4 56 34	1 56 34	1 52 56

Redwing, J. B. O'Donahue.....	5 11 20	2 11 20	2 11 20

Manhasset Bay Y. C.

Port Washington, Long Island Sound.—Saturday, July 23.

ONLY six boats started in the power boat races given by the Manhasset Bay Y. C. on Saturday, July 23. The strong breeze and lumpy water prevented some of the boats entered from starting. Miss Swift did not have a competitor, but she made the best time, covering a 12½-mile course in 57m. 21s. The summary:

Class A—Start, 3:35—Course, 12½ Miles.	Finish.	Elapsed.	Corrected.
Miss Swift, Robert Jacob.....	4 32 21	0 57 21
Class B—Start, 3:35—Course, 12½ Miles.	Finish.	Elapsed.	Corrected.

Seawanhaka Cup Defenders.

THE Seawanhaka cup races on Lake St. Louis will be held on August 4, 5, 6, and then again on the 7th, and perhaps the 8th, unless three races decide which side takes the cup, which is not likely, when two such clubs as the Royal St. Lawrence and White Bear Yacht Clubs come together.

The competing boats in the Royal St. Lawrence trial races are not so numerous as those which have taken part in the White Bear trials. Two new boats have been built—Noorna, owned by Mr. Huntley Drummond, and Æolus II., by Mr. George Slaughter. Thorella II., Commodore Finley's 1903 cup defender, is also competing, and though she has probably sailed more than any other boat on the lake, as well as cruising

ÆOLUS II.

Owned by Geo. Slaughter. Built for defense of Seawanhaka Cup.

through the Thousand Islands last year, yet, with Mr. Charles Routh at the tiller, she still makes the judges chuckle when the elapsed time is taken in races sailed by the three boats, and the best of it is that her weather is every weather, which makes the ideal racer. Nature is so hard to depend on.

Both Noorna (which was launched first) and Æolus II. have similar dimensions to Thorella II., whose length on the waterline is 22ft. 7in., and over all length 36ft. 9in., with a beam of 8ft. 6in., which practically corresponds to that of Noorna, while Æolus II. has only 8ft. 4in. beam.

Noorna, though having almost the same midship section as Thorella II., has perhaps a trifle easier turn to her bilge, and the deck lines look much fuller forward. She has considerably more sheer at her bow, and this,

NOORNA.

Owned by Huntley Drummond. Seawanhaka Cup Defender.

while it does not give her the racey appearance of Thorella II., will doubtless make her a drier boat to sail on. Her waterlines also look much fuller forward than the older boat, and she should show very easy diagonals, giving her speed in reaching. She is fitted with double rudders and bilge boards. The latter, instead of being hung on a sling pin, are let down vertically, thereby doing away with the long open slot, which is necessitated by the dagger boards.

Æolus II., while narrower than her sister, has a harder turn to the bilge and still fuller deck lines, and will probably show as much power as, and be an easier boat to drive than, Noorna. In moderate weather she should show great speed, and if powerful enough to carry her canvas in a blow to windward, will be a hard boat to beat. Like Noorna, she has double rudders, but her bilge boards are of the regular dagger type. The rig of both the new boats is exactly similar to Thorella II., and the sails are working out nicely.

A new feature of both boats is the fact that light

winches are used to work the peak and throat halliards, which does away with gear on deck.

Of course it is difficult to tell as yet the result of the trials, but there is every probability of the new boats proving themselves better than Thorella II., and are certainly very handsome looking boats, being beautifully stained and highly polished, and with perfect fitting sails of a very delicate creamy tint, it can be imagined that they present a pretty sight, and add lustre to the laurels already won in the past by their designer, Mr. Fred Shearwood.

Noorna has been chosen to defend the Seawanhaka cup. Out of three trial races sailed on Saturday, July 23, Noorna won two and Thorella won one.

Morgan Cup Race.

Island Heights, N. J.—Saturday, July 16.

THE second annual race for the J. Willard Morgan cup was sailed under the auspices of the Island Heights Y. C., on Barnegat Bay, on Saturday, July 16. The race is open to catboats of Bay Head, Mantoloking, Seaside Park and Island Heights Y. C.s. Boats were to be not less than 20ft. nor more than 26ft. racing length. Corinthian crews and number of boats limited to five from each club. The following particulars regarding the several contestants are interesting:

	Allowance.
Empress, W. M. Stevenson, Seaside Park.....	0 08 50
Nemo, D. H. Adams, Seaside Park.....	Scratch
Vagabond, F. W. Thacher, Seaside Park.....	0 00 34
Hummer, Bay Head.....	0 01 18
Romp, Bay Head.....	0 01 54
Pastime, Bay Head.....	0 01 48
Mina, J. A. Vansant, Island Heights.....	0 05 12
Boquet, W. Patterson, Island Heights.....	0 03 40
Mary E., Leon Goble, Island Heights.....	0 06 40
Miss Bob White, F. A. Downe, Island Heights.....	0 03 47
Edith, T. F. Brooks, Island Heights.....	0 04 15

The boats covered a 13-mile triangular course. At the time of the start the tide was running ebb, and the breeze was fresh from the S. Later the wind hauled to the W. and the boats encountered a nasty squall accompanied by drenching rain. Mina was first over the starting line, 14s. after the gun, but her rudder got jammed on the first leg and she dropped from first place. Miss Bob White carried away her throat halliard block in the squall and withdrew. Empress, holder of the Sewell cup, withdrew on the second leg of the course. Boquet shook out her reefs before the squall struck and in consequence had to luff continually during the heavy puffs, losing much time. Hummer won the race handily. Romp was second and Mary E. third. The summary:

	Start.	Finish.	Elapsed.	Corrected.
Hummer	1 36 47	3 45 41	2 08 54	2 07 36
Romp	1 35 23	3 47 48	2 12 25	2 10 31
Mary E.	1 37 04	3 54 53	2 17 49	2 11 06
Pastime	1 35 55	3 49 27	2 13 32	2 11 44
Boquet	1 39 02	3 57 59	2 18 57	2 15 17
Mina	1 35 14	4 01 21	2 26 06	2 20 54
Vagabond	1 36 30	3 59 56	2 23 26	2 22 52
Edith	1 35 46	4 05 17	2 29 31	2 25 16
Miss Bob White.....	1 35 21	Disabled.
Empress	1 35 34	Withdrew.
Nemo	1 35 53	Did not finish.

Beverly Y. C.

Wing's Neck, Buzzard's Bay—Saturday, July 16.

THE Beverly Y. C. sailed its third Corinthian race of the season from the club house on Wing's Neck, July 16, in a strong S.W. wind. The list of entries, considering the severity of the weather, was good. Eighteen started. Mr. Charles Whittemore acted as judge.

The 30-footers were sent to Bow Bells and back; the 18-footers and fourth class cats, to Bird Island and back, and the one-design 15-footers were given an inside course over to the buoy off Morhan's Rock and back, twice around.

Mr. Crane's new Hybrid again broke down, meeting with the same disaster she did a week ago. Although she had a new and heavier centerboard, it doubled under her very shortly after the start, making it absolutely impossible for the boat to go on. In this class, Illusion, Mr. Baker's new Herreshoff boat, also withdrew. The old champion Terrapin, in the strong wind, succeeded in beating the much older Quakeress. The race between the two was close. The time of all the boats in detail is given below:

30-Footers	Elapsed.
Young Miss, D. L. Whittemore.....	1 41 03
Pontiac, F. A. Beebe.....	1 43 16
Anita, R. F. Crane.....	1 45 54

Teazer, Mrs. R. W. Emmons.....	1 17 08
Jub Jub, Howard Stockton.....	1 17 52

Westhampton Country Club.

Westhampton, L. I.—Saturday, July 16.

EIGHTEEN boats started in the race given by the Westhampton Country Club on Saturday, July 16. At the start the wind was fresh from the S.W., but lost its strength later on in the day. Laurele, a Class B boat, upset at the start. In Class AA, Memory, was first; Spalpeen, W. S. Crevy, second. In Class A, Edna, G. P. Sandborn, was first; Sybil, Robert Gair, Jr., second, and Melody, James Crowell, third. In Class B, Lass, C. DeHarte, was first; Fleetwing, E. B. Reynolds, second, and Charon, John Lynn, third. First and second prizes of silver cups and challenge cups in Classes A and B were awarded. The summary:

Class AA—Start, 2:30.	Finish.	Elapsed.	Corrected.
Melody	4 14 50	1 44 49	1 44 49
Spalpeen	4 52 50	1 52 50	1 49 44

*Charon	4 43 59	2 07 59	2 07 59
*Lass	4 35 42	1 59 42	1 59 42

*Started at 2:36.

Erie Y. C.

THE boats had a very fair wind for their race on Saturday, July 16, and made splendid time. In the 30ft. class, Una won; time, 1:34:20; Nameless came in second. In the 25ft. class Mingo won in 1:32:30; Turtle's time was 1:35:35. In the 20ft. class Flora won in 1:37:10; Zephyr, her competitor, withdrew.

The time made to-day is about the best that will probably be made this summer.

CARLA BLANCO.

Eastern Yacht Club Cruise.

BAR HARBOR, July 23.—In a heavy rainstorm, with plenty of wind from the eastward and a proportionate amount of fog, the fleet of the Eastern Y. C. entered Bar Harbor this afternoon, after completing all of the squadron runs in the most successful cruise the club has had for many years. All through the cruise the racing was good, and the yachts stuck together well. Yachts that were obliged, for any reason, to stay out of a racing run, went along as soon as possible to the next port, and joined in the fun again. About twenty-five yachts in the harbor to-night is the result of this great interest. The regatta committee has worked hard to make this cruise, as well as other events held by the club this season, a success, and their labors have been rewarded. It may not seem that twenty-five yachts is a large number, but it must be remembered that this is an off year in yachting, especially in the racing of large sailing yachts, and the Eastern Y. C. is much to be congratulated on the showing it has made all around.

Those who joined in the cruise have been more than repaid for their enthusiasm, for they have had an opportunity of cruising along the finest coast in the country, in among beautiful islands, and in reaches where the wind is generally fair. Many of those who participated in the squadron runs have never cruised along this ground before, and they have been much impressed with the waters through which they have sailed. Fog held the fleet up one day at Peak's Island, but this very fog was responsible for probably the most remarkable squadron run that has ever been made. With the exception of calms, which were not very provoking, the aforesaid fog, and the rainstorm on the last day's run, the weather was good. Even in the fog, calm and rain, the fleet played in luck, for it seemed that something always turned up to help them along.

Good fortune attended the cruise from the very start. From a dead calm all the morning scheduled for the first squadron run, from Marblehead to Gloucester, the breeze increased until it was blowing at the rate of about nine miles an hour shortly before two. The starting line was formed between Lighthouse Point, on Marblehead Neck and Fort Sewall, on the town side. This gave an excellent view of the yachts to people who had flocked to both places. Conditions were perfect, with clear weather and a light southerly breeze blowing. There was just enough life to the water to make picturesque racing.

The preparatory whistle was blown at three, and a warning signal was given five minutes later. Then the different divisions started at intervals of five minutes. Sloops of classes J, K, and L were sent away first, so that they would have an opportunity of finishing as near as possible to the largest yachts. Then the divisions increased in size, the large schooners of classes A, B, and C starting last. Good starts were in order all around. The sloops, all of which came under the rating of class L, went over the line well bunched, breaking out balloons as they crossed, and making the most beautiful picture imaginable. Meemer, always around on time, got the start in this class. In the second division came the schooners of classes D and E, and the sloops of classes H and I. These schooners did not get away quite as quickly as the first division, and two of them crossed after the handicap time had expired. Athene of class H, and the Wasp of class I, were the sloop starters in this division. Wasp went up into the H class, and took time allowance from Athene. Athene was the first to get away, with a very good start, while Wasp got away some seconds later. As the first leg was a reach, however, it can hardly be said that Wasp did not have a good position.

The start of the day was in the big schooner division, which comprised classes A, B and C, all racing as one class. No finer schooner start has been seen in many years than the one made by these great sail carriers. Corona was well timed for the start, crossing the line only a few seconds after the whistle. The others were maneuvering close to the Fort Sewall shore, and in the limited space their enormous sail spread showed up in exaggerating comparison. As they wore ship, heeling to the press of canvas as they turned slowly, they looked positively beautiful. It is little wonder that old yachtsmen wish for the days of the big schooner racing, after witnessing such a sight. Emerald, Constellation, and Constance crossed the line after Corona, in the order named, within a very few seconds of each other, while Chanticleer was close behind, luffing out to get the windward berth. All broke out balloon jib topsails as they crossed the line, and they traveled on the reach to Halfway Rock under a 9-mile breeze, as though they were things animate.

From Halfway Rock a straight course was laid to Gloucester harbor. The big schooners soon caught up with the smaller classes, and the next smallest division, in turn, caught up with those smaller. A falling in the breeze, however, soon after they had squared away for Gloucester, gave the little fellows a chance of keeping up. In fact, the conditions were so fluky that the streaks in the wind were responsible for leading positions in some cases. Under such conditions size told immensely, and the big Constellation was leading the fleet as it passed in by Norman's Woe. Athene led Wasp by a good margin, but not enough to save her handicap. Agatha led the schooners of classes D and E from the start, having been handled well in the fluky breeze. The sloops of class L were led by Heron, but Dorel had time allowance enough to get first on the bookkeeping end of the game.

A pleasant evening was spent in Gloucester harbor. A vaudeville entertainment was given on board Mr. Charles Hayden's steam yacht Aria, which was attended by about 100 members and guests. A slight-of-hand performance was the feature of the evening, but the performer, although skillful, did not give any examples of how a tailender could be made to appear first on the summary sheet. Some of the yachtsmen visited the city, where, according to Saturday night custom, the streets were illuminated with many colored lights and a band kept moving from place to place, followed by those interested in the music and also by small boys who had distinct views of other noises which were not always in tune. This feature, instituted by the business men of

Gloucester, no doubt puzzled many of the visiting yachtsmen.

An early start was planned for the next run from Gloucester to the Isles of Shoals, but as there was a lack of breeze, it was not until eleven when the preparatory whistle was blown. Fluky conditions governed the part of this run as far as Cape Ann, almost continuously, and from there to White Island whistling buoy, where the finish line was drawn, the squadron had a very light southerly breeze. It was on this run that Emerald had the honor of being the first yacht in, the run being made in very slow time. Athene again lost to Wasp on time allowance, and Puritan lost to Hope Leslie by the same reason. Mira was a newcomer in the smaller division of sloops, racing in one class with the class L yachts. She led the class to the finish line, but lost to the 22-footer Medric on time allowance. Very little life was evident on the islands, and most of the yachtsmen retired very early, the fleet being in complete silence, save for the ringing of bells by the watches at ten o'clock.

The following morning broke clear in the little harbor of Gosport, and although there was evidence of some haze away to the eastward, there was probably none who thought that evening would see the finish of one of the most remarkable squadron runs that has ever been made. The run was from off Appledore Island to Peak's Island, the finish being off Portland Head. Everybody was out early, and the preparatory whistle was blown at nine. All the classes got away well, and were going along at a lively clip, with the wind southeast, when the fog commenced to roll in, lightly at first, but increasing in thickness. When they were about half way from the Isles of Shoals to Boone Island, the fog came in in thick rolls. From this time to the finish no one, not even those competing in the race, knew what the yachts were doing. For about thirty-eight miles they raced in the fog without seeing anything. The committee boat, anchored 600 feet from Portland Head, could not distinguish the light-house from the time she anchored. Corona was the first vessel in the fleet to make her appearance, and she could not be made out until she was within fifty feet away and headed straight for the committee boat. Some of the finishes were very close in every class. Athene on this run was able to give Wasp her time allowance and have over an hour to spare besides. Agatha sailed a great race in classes D and E, schooners, leading all the way. Mira and Heron sailed very close in the sloop class. Mira was over a minute ahead on elapsed time, but lost to Heron on corrected time. The best part of the race was that every one of the eighteen starters was accounted for and all but two crossed the finish line.

It was so thick that the yachts had to anchor as best they could. Some went up into Portland inner harbor, some anchored in Diamond Island roads, others off Peak's Island, and a few off House Island. The fog was so thick in the morning that it was decided to postpone the next run for a day. The committee boat went about among the fleet and towed the scattered yachts all over to the anchorage off Peak's Island. Many of the yachtsmen visited the Gem Theater, a summer playhouse on Peak's Island, where a light comedy was enjoyed more or less. There was also an entertainment at the Peak's Island House which attracted some. The crews enjoyed themselves, with the natives and summer visitors, by watching the arrivals and departures of the Portland boats.

As one day had been lost on the schedule by forced stay at Peak's Island, the programme for the next run was changed, the terminus being made off Whitehead, at the entrance to Mussel Ridge channel and Seal Harbor. It was understood that the yachts should proceed to Gilky's Harbor, Islesboro, as soon as possible, so that a good part of the proposed day might be spent at the latter place. This gave a racing run of fifty-one miles, the longest of any during the cruise. There was very little that was interesting at the start. The wind was so light that the yachts had to be towed out, and when they started they were between a south-southwest wind and a wind off the shore blowing north-northwest. The result was that they were in a greasy spot, and the start was chiefly noticeable for the great number of handicaps. Most of the yachts got into the northwest breeze after a time, and went along well, but when they were off Junk of Pork Island the wind left them again, and they were in the doldrums until two, when most of the fleet was about four miles to the eastward of Halfway Rock. Then gradually all hands got the breeze north-northwest with some strength, and a smooth sea, and they made fast time to the finish, Corona leading the fleet in. Hope Leslie won in classes D and E, schooners, and Athene finished far enough ahead of Wasp to give the time allowance, but she had only 20 seconds to spare. Mira again led the small sloops, and Dorel again took first on corrected time.

The fleet anchored in Gilky's Harbor the next day, all being in before noon. There was thus an opportunity of spending considerable time at Islesboro. Those who went ashore also had an opportunity of absorbing considerable Islesboro dust into their lungs and clothes. It may not always follow, but Islesboro on this particular occasion was far more beautiful when viewed from the harbor than it was on shore.

On Friday, July 22, the squadron raced from Dark Harbor to Bartlett's Narrows. This was the most beautiful run of the whole cruise through Eggemoggin Reach and up Blue Hill Bay. The beauties of this cruising ground, with its wealth of wild nature, cannot be exaggerated. The start was made at eleven, and the yachts covered the twenty-seven miles in fair time. They had a reach for the best part of the way, losing the wind for a little time off Cape Bennett. Corona and Emerald had a hot tussle as far as this point, but when the breeze came in again, Corona passed Emerald, which had got the start and had been leading, and led the fleet all the rest of the way in to the finish. Puritan led in classes D and E, schooners, but lost on time allowance to Hope Leslie. Mira led again in the small sloops, and this time she saved her allowance. The fleet anchored in Great Cove, a bay in Bartlett's Island. It is a beautiful little harbor, surrounded by the great Blue Hills, with rock-bound, forest-covered islands all around it. It is completely landlocked, and one could not imagine a better place to run to in bad weather, if one only knew it was

there and how to get in. The masts of the tallest schooners were completely hidden when only a short distance away. In spite of its beauties, it was a very lonely place on this occasion, for there was not another vessel at anchor, except the yachts, and there was no place on shore at which one could find amusement. Perhaps it was the proper place on that night, however, for every one was tired and the quiet of the place and the cool air afforded excellent opportunities for sleeping.

That night there was a big ring around the moon, and there was more or less spindrift to the westward. The moon barometer did not fail in its prediction, for generous quantities of rain fell during the night, and rain was still falling when day broke. The wind was easterly, and it was decidedly cold. The preparatory whistle was blown at ten, at which time there was a stiff breeze blowing about east by south. The sloops of class L found this so strong that none of them cared to carry topsails except Vandal, a small edition of the old sloop Puritan, which carried hers without any difficulty. The starts were particularly good in all classes, the yachts crossing within seconds of each other, and in one instance two crossed together, Dorel and Cossack, in class L, sloops. These two had a hot contest all over the course of 25½ miles to the bell buoy off Egg Rock, the smaller yacht sailing a great race. She stuck to Cossack like glue, and won easily on time allowance. Puritan, the last starter in classes D and E, schooners, took the lead off Placentia Island and was across the finish line first, but lost to Agatha on time allowance. In this class there was a hot start between Agatha and Hope Leslie, in which Agatha gained the advantage. The best starts of the cruise were seen in the big schooners. Constance was looking for the weather berth before the start, and Emerald and Corona went up to contest it with her. Neither could luff the Constance out, and Corona gave them a dose of backwind before wearing for the line. Corona was too soon, however, and had to return, taking the full two minutes. In the meantime Chanticleer went across the starting line first, with Emerald on her weather quarter. Constance, which had held up to windward, now came down and blanketed Emerald, which was placed in a pocket by this move, as she took back wind from Chanticleer. They reached to the end of Black Island, where the wind came in east-northeast, with great quantities of rain. Chanticleer had been leading to this point, but on the beat to Baker Island Corona went up and passed her, leading to the finish. After finishing off Egg Rock whistling buoy, the yachts passed into the harbor and anchored. It was a miserable afternoon and evening, and Sunday, the day off before the special Bar Harbor invitation race, was gloomy with rain and fog. The following is the official summary of all the squadron runs:

Annual cruise, 1904, Saturday, July 16.—Marblehead to Gloucester; wind, S.W. by S.; preparatory, 3 P. M.; distance, 9¾ miles; tide, 2 hours ebb.

Third Division—Sloops and Yawls—Classes J, K and L—Start, 10m. after Preparatory.					
	Start.	Finish.	Elapsed.	Corrected.	
Cossack	3 10 59	4 53 33	1 42 34	1 42 34

British Letter.

Ingomar's Performances Abroad.

AFTER the hard breezes which had prevailed during the Dover-Heligoland race, the regatta at Cuxhaven on the Elbe and the first three days at Kiel, it was a welcome change to find a pleasant summer breeze and bright sunshine for the return match from Eckernförde to Kiel on June 29. His Majesty King Edward VII. had given a magnificent gold cup, value 2,000 guineas, to be sailed for by the schooners, and a fleet of eight fine vessels competed for this trophy. Three of them—Meteor, Iduna (ex-Yampa), and Ingomar—were of American design and construction, and the remaining five—Hamburg, Adela, Evelyn, Clara, and Susanne—are British-built vessels. It was the best turn out of schooners that has been seen for many a day, and it is unfortunate that paltry and fluky winds should have robbed the match of much of its interest. The new Fife schooner Susanne proved the winner, and she would probably have won in any case, but she had the assistance of a big lift at mid-day, when the leading boats were becalmed, and flaws and catpaws prevailed until 5:30 P. M., when quite a nice breeze sprang up, and brought them to a finish. Susanne won the King's cup with 18m. to spare, and Iduna saved her time from Ingomar for second prize, the latter getting third, and Adela fourth. The course was just over fifty miles.

All the cutters and yawls were classed together, Orion—ex-Meteor II.—being scratch boat. Nine started in this class, which had their gun one hour after the schooners, but so fluky was the weather that Brynhild picked up a slant and actually arrived at Kiel 20m. ahead of Meteor, the first boat in of the schooners. Brynhild was an easy winner in her class.

On July 1 the racing fleet sailed a series of races from Kiel to Travemünde, the bigger vessels going round the Island of Fehmarn, a distance of 78 miles, and the small fry passing inside the island, thus cutting off several miles. Neither Meteor nor Iduna hoisted racing colors, so Ingomar's sole opponent was Hamburg, and in the light summer breezes and calms which were the order of the day, she beat the old Rainbow by an hour and a quarter. It was a dreary race, for they started at 8 A. M. and Ingomar did not cross the winning line until after 9 P. M. It was a pity that all the big vessels were not classed together in a handicap. There were only eleven altogether, and they were cut up into six classes, with the result that three boats had a sail over; Navahoe had

only the old Comet (ex-Thistle) for an opponent, while Orion, Clara, and Susanne were without competitors. It was a great day for American boats. Ingomar and Navahoe won in their respective classes, and the Crowninshield boat, Swan, was first of all the smaller classes to arrive at Travemünde, and was actually third boat home. It must be remembered, however, that she started at 6 A. M., or two hours before the big class, and that she came through Fehmarn Sound, which cuts off about 20 miles.

The last of the German regattas was sailed in Lübeck Bay on July 3. Meteor and Iduna were not in the list, so Ingomar had Hamburg only for opponent. Clara and Susanne made up the smaller schooner class, while Orion, Navahoe, Comet, Valdora, and Kommodore were split into three classes. It was a fluky day, the only breeze there was coming toward the end of the racing. Ingomar led Hamburg right round the course, and won easily. Orion, Navahoe, and Valdora each took a first prize, and Susanne came in ahead of Clara.

The form displayed by Ingomar throughout the whole of the regatta has been most exemplary. She was by far the stiffest of all the schooners, in spite of her enormous sail spread, and her sailing is fresh breezes was beyond reproach. In light weather she appeared to be a very speedy vessel, also, but she did not always have the best of luck, as every light wind day was more or less fluky. Still, enough was seen of her sailing to make it clear that she is a very dangerous vessel in all weathers, and probably the only schooner that can hold her on time allowance is the Fife-designed Susanne, and that would only be in very fine weather. Ingomar has sailed one race in British waters, the occasion being the Deal regatta of the Royal Temple Y. C., on July 14. The match was a handicap, and her opponents included such fine boats as White Heather, Therese, Valdora, Tutty, Rosamond, and Creole. The weather was so paltry, however, that the course had to be shortened to 16 miles. Mr. Plant's vessel ghosted along so well in the fickle airs that she was an easy winner, but too much store must not be set by this victory, because the Deal course is notoriously fluky in light airs, and the leading boat at such times often gets the best of the luck.

The Clyde Fortnight has been productive of some fair sport, though the absence of big vessels deprived the event of that degree of magnificence which the presence of a fleet of stately vessels always produces. On the opening day the 52ft. race was the principal item on the programme, but the following day, July 1, Bona and the new 65-footer, Zinita, joined issue, and they were subsequently reinforced by the new Nicholson fast cruiser, Merrymaid, and the old 40-rater, Carina. Bona was quite out of form on the first day, and Zinita finished less than 6m. astern of her, although the match was sailed in a fresh wind and plenty of sea. Bona turned the tables on Zinita the following day, and both boats beat Merrymaid and Carina. As a result of the first week's racing, Bona and Zinita each won two first prizes, and Merrymaid scored first honors once. The 52-footers had two more races than the bigger boats, or six in all, with the result that Moyana, Maymon, and Lucida won two first prizes each, and Camellia one. The racing between them was very keen and exciting, and was far more interesting than would have been the case had any one boat shown conclusive superiority over the rest. There was quite a large muster in the handicap for yachts not exceeding 60 rating, and the racing between the Clyde 20-ton one-design class, the 36-footers Falcon and Barabel, and the new 30ft. restricted Clyde class was of a high standard. Of course the little length class boats were very much in evidence, and had it not been for the absence of nearly all the big handicap boats the racing would have been worthy of even the Clyde.

The regatta of the Royal Temple Y. C. at Ramsgate and Deal has just been brought to a conclusion, and has once more given proof of the increasing popularity of the fixture. The club has this year doubled its accommodation for members at Ramsgate by taking over the house on the west cliff next to the house which they have used as a club for the past seven years, and making the two houses into one. This move was made necessary on account of the ever-increasing membership of the club and the enhanced importance of its annual regatta, which brings many visitors into the club from the competing yachts at regatta time.

E. H. KELLY.

A Letter from Mr. Hawes.

Editor Forest and Stream:

I have just returned from Marblehead on board my sloop yacht Ray II., which was the first boat of the genuine cruisers to cross the finish line in the Lipton cup ocean race from Sandy Hook to Marblehead Harbor, and find awaiting me a letter from Sir Thomas Lipton, which will be of general interest, as it fully sustains the position which I have always taken with respect to cruising yachts versus racing machines. The letter is as follows:

"CITY ROAD, London, E. C., July 12, 1904.—My Dear Mr. Hawes:—I duly received your favor of the 28th ult., with inclosure, which I have perused with much interest and pleasure, and I was very glad indeed to notice since receiving your letter that Ray II. made so good a show in the race. I am very grateful, indeed, to you for your kindly references both in your letter and the matter sent to the Sun, and I beg you will accept my warmest thanks. I trust at some not far distant time I may have the pleasure of meeting you and of thanking you in person for your courtesy. I can indorse all you say about encouraging the building of a healthier type of boat, and I am glad to know that your speedy little craft is one of that class. With renewed thanks and best wishes,

"Yours faithfully,

"(Signed) THOMAS J. LIPTON."

In order to correct some misapprehension which has arisen in certain quarters, I would like to add a few words of explanation with regard to the protest which has been filed against awarding any prize to either Little Rhody or Newasi. Both of these yachts were built for racing, not cruising, and an inspection of them would clearly demonstrate that they were not eligible. In fact, the entry of Little Rhody was rejected by the committee on the ground that she was a racing machine. I was

therefore astonished when I found her at anchor off the Brooklyn Y. C. on Friday, July 1, evidently prepared to start in the race the following morning. I at once protested against both Little Rhody and Newasi, and stated that I would withdraw my boat, Ray II., as the published conditions of the race declared only "bona fide cruisers" could compete. I was assured, however, that these two entries had been accepted only "provisionally," and that if it should be determined that they were racing machines they would be barred out of the contest. Relying upon this assurance, I started in the race, and my boat Ray II. was the first of the cruisers to finish. In all justice and fairness she is entitled therefore to the first prize, or Lipton cup, the second prize going to the yawl Fanshawe, and the third to the sloop Mignon.

It further appeared after the race was over that both the protested yachts had violated the sailing directions by having on board professionals who assisted in sailing and navigating the craft, in addition to the one regular sailor allowed on each. As soon as the racing committee, composed of three gentlemen of ability and integrity, in whom I have the utmost confidence, are ready to take up the matter, I and the captains of the other protesting yachts will present ample proofs by affidavits, photographs, and oral testimony, showing that neither of the protested yachts is entitled to any of the prizes, but that the same should be awarded in the order above set forth.

I may also say that these protests have been made not for the purpose of securing a trophy, but solely in the interest of the noble sport of yachting, to prevent an award to boats not entitled to same, and to encourage Corinthian sailors of "bona fide cruisers" by securing to them the fruits of their hard earned victory.

GILBERT RAY HAWES.

Little Rhody Awarded Lipton Cup.

A MEETING of the Regatta Committee of the Brooklyn Y. C. was held Thursday, July 21, and after carefully considering the protest made by Mr. Gilbert Ray Hawes, it was unanimously decided to award the Lipton cup to the Little Rhody, C. F. Tillinghast, owner, for the reason that she had fully complied with the conditions and sailing directions in the ocean race from New York to Marblehead, Mass., which started July 2, 1904.

The cup will be formally presented at the club house early in August, and all those who participated in the race, with their friends, will be invited to attend.

In regard to Mr. Hawes' protest against the Newasi, the committee have asked for a statement from the owner, and until complete evidence is obtained, will not be able yet to award the second and third prizes. Regatta Committee—D. G. Whitlock, chairman; J. A. Donnelly, and V. H. Kimmelman, Charles A. Kelly, Secretary.

The following letter has been sent to the owner of Little Rhody by D. W. Whitlock, chairman of the race committee:

BROOKLYN N. Y., July 22, 1904.

Captain Charles F. Tillinghast, Vice-Commodore Bristol Y. C., Bristol, R. I.

DEAR SIR—I am very pleased to inform you that the regatta committee of the Brooklyn Y. C. declines to entertain the protest entered by Mr. G. R. Hawes against Little Rhody, and, therefore, the Sir Thomas Lipton cup has been awarded to you for finishing first in the ocean race of the Brooklyn Y. C. from New York to Marblehead. I take this opportunity at the same time to congratulate you on the splendid showing made by Little Rhody in this race, and you and all the members of your crew are deserving of the greatest credit for the way you pushed forward your boat at all times.

There will be a formal presentation of this cup, together with the other prizes, at the club house of the Brooklyn Y. C. some time during the month of August, and we hope you and your crew will find it convenient to be present. You will receive formal notice of this later.

It is our intention to exhibit this cup before presentation in some prominent show window in both New York city and Brooklyn before the same passes from our control.

Yours sincerely,

D. G. WHITLOCK,

Chairman Regatta Committee of the Brooklyn Y. C.

YACHTING NEWS NOTES.

For advertising relating to this department see pages ii and iii.

CHRISTABEL ARRIVES.—The English steam yacht Christabel, now under charter to Mr. Adrian C. Iselin, Jr., reached New York on Saturday, July 23, from Cowes via St. Michael's.

YAWL POSSUM SOLD.—Mr. Albert L. Pope, of New York city, has purchased the auxiliary yawl Possum from Mr. Ad. Erdman, New York, through the agency of Stanley M. Seaman. Possum is 44ft. over all and 31ft. waterline. She was built in 1899 by L. D. Huntington, Jr., New Rochelle, N. Y.

N. Y. Y. C. YEAR BOOK.—We are indebted to Mr. George A. Cormack, secretary of the New York Y. C., for a copy of the Year Book for 1904. The book is handsomely bound in red waterproof leather, and is far more complete than ever before.

KNICKERBOCKER Y. C. CRUISE.—The programme of the Knickerbocker Y. C. cruise is as follows:

Saturday, August 6—Captains and guests will meet on board flagship at 9 P. M.

Sunday, August 7—Informal run to Black Rock.

Monday, August 8—First squadron run, Black Rock to Thimble Islands. Fireworks in the evening.

Tuesday, August 9—Remain at Thimble Islands. Dress ship, gig races, swimming matches, and general events. Hop in the evening.

Wednesday, August 10—Second squadron run, Thimble Islands to Shelter Island.

Thursday, August 11—Remain at anchor and dress ship. Inspection of the fleet by the commodore and his staff.

Friday, August 12—Third squadron run, Shelter Island to Thimble Islands.

Saturday, August 13—Captains and guests will meet on board flagship at 9 A. M. Fleet will disband.

RECENT SALES.—Messrs. Macconnell & Cook have made the following sales: Gasolene launch Canoga, owned by Mr. M. A. Heath, to Mr. John H. Petermann, of Charleston, S. C.; gasolene launch Loretta, owned by A. C. D. Wilson, of Trenton, N. J., to Mr. Stevenson Taylor, of this city; sloop yacht Nomad, owned by Mr. Charles L. Morrison, of this city, to Willis L. Sawyer, of New York. Chartered the schooner yacht Uncas, owned by Mr. James E. Weir, Jr., to Mr. Walter R. Herrick.

Seawanhaka Corinthian Y. C.

Oyster Bay, Long Island Sound.—Saturday, July 23. SEVEN boats of the Seawanhaka 15ft. one-design class and three of the raceabout class raced on Saturday, July 23. The breeze was fresh from the E.N.E., and the boats covered inside triangular courses. The 15-footers were all sailed by women, and Bairn won by 1m. 53s. Wee Wean was second, and Imp was third. The prize in this class was a silver cup offered by Rear Commodore Frank S. Hastings. Mystery won in the raceabout class, and Nathalie was second. The summary:

15ft. Class—Start, 3:10—Course, 13 Miles.	Finish.	Elapsed.
Bairn, Miss Van Matheson.....	5 03 22	1 53 22
Wee Wean, Mrs. D. W. Burnham.....	5 05 15	1 55 22
Imp, Miss Agnes Laudon.....	5 05 29	1 55 29
Fly, Miss Christine Roosevelt.....	5 05 46	1 55 46
Sabrina, Mrs. George Bullock.....	5 08 00	1 58 00
Nit, Mrs. Charles A. Sherman.....	5 10 44	2 00 44
Chipmunk, Miss May Young.....	5 11 20	2 01 20
Raceabout Class—Start, 3:20—Course, 13 Miles.		
Mystery, Johnston De Forest.....	4 59 31	1 39 31
Nathalie, F. G. Stewart.....	5 01 05	1 41 05
Jolly Roger, T. B. Blecher.....	5 02 55	1 42 55

Bergen Beach Y. C.

Bergen Beach, L. I.—Saturday, July 23. THERE were nine starters in the race for cups offered by Commodore Fuller on July 23. The winners were Jennie Lee, Baby Roger, Ariel and Margaret. The boats sailed twice over a course from the club house at Bergen Beach to a stake boat off Canarsie; then through the main channel to the red spar buoy and return to the starting point. This made the first leg a beat to windward, the second a close reach, the third a run and the fourth a broad reach. The judges were F. E. Eagle, W. L. Allen and R. Fritsche. The summary follows:

Launches—Start, 3:30.		
Jennie Lee, R. O. Sidney.....	4 32 36	1 02 36
Gracie, C. H. Green.....	Did not finish.	
Sloops—Class B—Start, 3:35.		
Baby Roger, George Boehm.....	5 12 01	1 35 05
Marion, W. C. E. Pens.....	5 11 48	1 36 48
Open Cats—Class D—Start, 3:45.		
Rival, W. A. Bonnell.....	5 19 35	1 35 04
Ariel, W. P. Hewlett.....	5 14 50	1 29 50
Open Cats—Class E—Start, 3:50.		
Doctor, George H. Hopper.....	5 28 11	1 38 11
Coquette, Mr. Pearsall.....	5 37 00	1 43 30
Margaret, E. D. Fisher.....	5 31 37	1 35 07

Chicago Y. C. Cruising Race.

THE longest cruising race, for the largest prizes ever given in the west, will be sailed on Aug. 3 by the Chicago Y. C. from Chicago to Mackinac. Besides silver cups to the winners in each of the schooner, sloop and yawl classes and a prize for the best kept log-book, offered by the Chicago Y. C., the Mackinac Y. C. has hung up a purse of \$1,000 in gold to be divided among the winners. The course is 331 miles in length, 1 mile longer than the New York Y. C.'s course from Sandy Hook to Marblehead. The start will be at 5 P. M., Aug. 3. Vessel captains are requested to note the names of any yachts they may encounter en route, and report name and location to the Chicago Y. C. by telegraph, charges collect. Yachts will fly their signal flags by day. The interest in the race is so general that the course of many passenger steamers will be changed to give their patrons a view of the race. The following yachts have entered: Schooners—Mistral, Dwight Lawrence; Hawthorne, John McConnell, Geo. O. Clinch, and Charles E. Fox; Alice, Ogden McClurg and H. H. Wait. Sloops—Vanenna, Wm. F. Cameron; Vencador, Fred A. Price; Siren, Alex Stewart, Murdock MacLeod and F. J. Canty. Yawls—Nahma, Fleet Capt Campbell and Dr. Elliott Carpenter; Arcadia, Rear Commodore Wm. L. Baum and Alex Robertson; Tannis, Jno. B. Berryman; Naiad, Fayette F. Soule, Chas. E. Soule, Jr., and Fred W. Hill; Windward, Paul Springer. Yawls Navarre, of the Milwaukee Y. C., Coloma, of the Macatawa Y. C., and the sloop Neva, of the Columbia Y. C., are also entered.

Canoeing.

To Amend A. C. A. Constitution.

To the Members of the American Canoe Association. GENTLEMEN—I hereby give notice that at the executive meeting, to be held at Sugar Island in August, I shall move to amend Article VI., Section 1, line 5, of the Constitution, page 8 of the 1904 Year Book, to read: "The officers of the Association, with the Executive Committees of the several divisions, shall constitute the Executive Committee of the Association."

This section always read as I wish to amend it until the amendments were passed at the meeting last August, and I believe if the Executive Committee is cut down to ten men, with the Commodore and Secretary-Treasurer, it will lessen the interest of just that number of men who were cut out of the committee, and whose presence at the executive meetings in October helps to enthrall them, and through them their fellow members at home.

JOHN S. WRIGHT,
Secretary-Treasurer.

American Canoe Association.

To A. C. A. Members:

In order to accommodate members wishing to come to camp early, arrangements have been made to have caterer begin serving meals Saturday, July 30.

Any member intending to be in camp before August 5 wishing tents, cots, etc., should notify at once H. W. Breitenstein, chairman of Camp Site Committee, 511 Market street, Pittsburg, Pa. Orders after July 28 should be addressed care of A. C. A. Camp, Sugar Island, Clayton, N. Y.

C. F. WOLTERS,
Commodore.

Rifle Range and Gallery.

The National Rifle Association.

Editor Forest and Stream:

The British Rifle Association consents to act as custodian of the Palma trophy until it shall be shot for again, but does not receive it on behalf of any team that competed in the match of 1903, when the Americans won it by confessedly unfair means. The incident may be considered closed between the British and American associations, but for the credit of American riflemen it should not be regarded as closed, as between the honorable members of our National Association and the officers responsible for the scandal.

I notice that the editor of Outing denounces the course of the British Association as "thoroughly discreditable" and "despicable," and gives a pretended resumé of the Palma trophy controversy, which is grotesquely at variance with fact. He says:

"Truth is that the American team was actually nearer the spirit of the contest than the Englishmen, for the rifle used by them was the one that had been newly adopted by the United States Government, but not yet issued."

Nothing could be further from the truth, unless it be this other assertion of Mr. Whitney's, that "the American Government, notorious in its disregard of its riflemen, could not be aroused to enough interest in the match to hurry its Washington circumlocution office into 'viewing' the rifle taken by our team."

Let us keep the record straight. The British Association never protested the result of the match of 1903. When it was published in this country that the American team used a rifle very different from the service arm, the British Association politely asked the American Association for an explanation. Gen. Spencer, president of the American Association, explained that the American barrels, although of private make, "conformed strictly in rifling to Government specifications." The explanation was accepted and the incident was declared closed. Subsequently the British Association received proof that Gen. Spencer's statement was untrue, and members remarked that it was impossible to have further relations with the American Association. No communication was made officially, the resulting controversy being carried on by the newspapers, and the officers of the American Association.

Gen. Spencer reiterated his statement through the columns of the Evening Post and otherwise, and the Post obtained from the maker of the American barrels, H. M. Pope, a signed statement proving that the rifling differed radically from the United States service arm, and did not conform in any particular to Government specifications. The service rifle has four grooves and 10in. twist. The Pope barrel has eight grooves and 8in. twist, and only half the depth of the military grooves. In other important particulars the Pope system is vastly superior to the military rifling, as riflemen know.

Moreover, there was published in the FOREST AND STREAM a communication from Col. Frank H. Phipps, Ord. Dept., U. S. A., Commanding, in which it was specifically stated that no rifle of an 8in. twist and eight grooves had ever been issued, or ever approved by the Government, down to so late a date as June 21, 1904.

The nub of this whole business is that an absolutely untrue statement was made by the president of the American Association, and "ratified" by the executive committee in the very resolutions of June 11, withdrawing the Palma trophy from competition this year and returning it to the British Association. If the statement were true, no conceivable reason could exist for returning the trophy. Instead of being an honorable way out, the action of the executive committee only rubs in the disgrace brought upon our National Rifle Association by tricksters and quibblers.

The reason why members of the Association, who understand thoroughly the situation, submit to being misrepresented by these "ratifiers" of falsehood and tacit confessions of trickery is that the National Rifle Association is sustained largely by New Jersey, and Gen. Spencer and his confederates are New Jersey militia officers with a pull.

The controversy is ended officially, but let us not be deluded into the notion that the return of the Palma trophy to England, accompanied by a reassertion of statements proved to be untrue, re-establishes our National Rifle Association in the respect of honorable sportsmen. Nothing short of reorganization can do that.

NEW YORK, July 18.

ALLEN KELLY.

Indoor .22 Caliber Rifle League of the U. S.

FOR years the small-bore rifle shooters of this country have been planning to hold a national championship rifle shoot, and at last it seems that a way has been found to hold such a shoot.

The Iroquois Rifle Club, of Pittsburg, about a year ago appointed a committee of ten to find ways and means of holding a championship tournament at their club. This committee applied for a charter with which they could incorporate rifle clubs of the .22 caliber into a league, and this charter has been granted.

The name of this league is the Indoor Twenty-two Caliber Rifle League of the United States, and its object is to advance the art of rifle shooting and to hold annual championship contests.

The Iroquois Rifle Club, being the originator of this league, will hold the first shoot. For this purpose they are prepared to hold the largest indoor rifle contest ever held in this country, their prizes will be very liberal, so that if a man in California wins he can pay all his expenses and still have money left. On the championship event alone, \$1,000 in cash prizes will be divided.

President Roosevelt will be asked to fire the first shot in the tournament, and from his active interest in the rifle, it is probable that he will come. The shoot will be held in the first part of October.

The cost of becoming a member of the league is very small, and it is composed of both active members, which are clubs, and associate members, who are individuals.

The place where the shoot will be held is the largest rifle club house in the United States, having five 75ft. ranges and all the modern improvements for handling a large crowd of contestants.

The officers of the league are: President, Henry Sperling; Vice-President, R. R. Bennett; Secretary and Treasurer, J. H. Dimling; Corresponding Secretary, Karl W. Zoeller. Board of Directors: E. C. Reed, A. J. Huebner, Chas. G. Grubb, C. C. Hofmeister, Walter Reibling, George Foerster.

Application for membership blanks to be made to Karl W. Zoeller, in care of the Iroquois Rifle Club, 1710 Jane street, Pittsburg, Pa.

Concerning the foregoing, the membership qualifications are as follows:

Active members: Initiation \$5; \$2 per year dues. Associate members: Initiation \$1; 50 cents per year dues.

(a) Active membership shall consist of regularly organized rifle clubs, who shall, at a meeting held during the annual tournament, elect officers and choose place of next tournament, either in person or by proxy; each active member entitled to three votes.

(b) Associate members shall consist of individuals who shall enjoy all privileges of the league, with the exception of voting.

(c) Clubs or individuals, upon written application and payment of dues and initiation fee, shall become members of the league, if favorably approved by the president and secretary; application to be made on blanks furnished by the league.

Cincinnati Rifle Association.

The following scores were made in regular competition by members of the Cincinnati Rifle Association, at Four-Mile House, Reading road, July 17. Conditions: 200yds., offhand at the 25-ring target. Payne was champion for the day with the good score of 227. Hasenzahl was high on the honor with 66 points. The annual election of officers was held to-day, and the following members were elected to fill the several offices: President, H. C. Roberts; Vice-President, J. Hofman; Secretary, A. Drube; Treasurer, H. H. Uckotter; Captain, Mat. Gindele; Lieutenant, E. D. Payne.

The annual prize shoot of this Association will take place on Sept. 25; open to all. Mr. Topf, one of our genial old members, was accorded a hearty welcome into our midst to-day by all present. He has had quite a protracted spell of illness, and his presence had quite a cheering effect upon the boys.

Payne	227	225	221	219	218	Lux	203	201	194	194	193

Interstate Shooting Tournament.

THE programme of the interstate shooting tournament of the National Rifle Association of America and the New Jersey State Rifle Association, to be held at Sea Girt, N. J., Sept. 1-10, provides events for rifle, pistol and revolver. The order of events is as follows:

First Day, Thursday, Sept. 1.—10 A. M., opening of meeting; 3 P. M., inspectors' match; 1 to 6 P. M., the Seabury and Spencer matches will be open; short and mid-range individual matches all day.

Second Day, Friday, Sept. 2.—9 A. M., 200yd. stage Columbia trophy match; 1 P. M., 500yd. stage Columbia trophy match; 1 to 6 P. M., the Seabury and Spencer matches will be open. Short and mid-range individual matches all day.

Third Day, Saturday, Sept. 3.—9 A. M., carbine team match; 10 A. M., veteran organization; 1 P. M. Wimbledon cup match; 2 P. M., all-comers' revolver squadded competition, No. 27. Short and mid-range individual matches all day.

Fourth Day, Sunday, Sept. 4.—11 A. M., divine service.

Fifth Day, Monday, Sept. 5, Labor Day.—9 A. M., cadet team match; also revolver team match; 1 P. M., interclub match; 1 to 6 P. M., the Seabury and Spencer matches will be open. Short and mid-range individual matches all day.

Sixth Day, Tuesday, Sept. 6.—9 A. M., 200yd. stage regimental match; 2 P. M., 600yd. stage regimental match; 1 to 6 P. M., the Seabury and Spencer matches will be open.

Seventh Day, Wednesday, Sept. 7.—9 A. M., company team match; 12:30 P. M., Leech cup match. Short and mid-range individual matches all day.

Eighth Day, Thursday, Sept. 8.—9 A. M., first stage, 200 and 600yds. Dryden trophy match; 2 P. M., second stage, 1,000yds., Dryden trophy match. Short ranges open during the afternoon.

Ninth Day, Friday, Sept. 9.—9 A. M., regimental skirmish match; 3 P. M., company, tyro, match. All individual matches open after skirmish match.

Tenth Day, Saturday, Sept. 10.—The long ranges will not be open previous to the shooting of the president's match; 9 A. M., first stage of president's match, 200, 300, 500 and 600 yards. The second stage will follow without intermission. 5 P. M., "cease firing."

Continuous matches will be open on the 200 and 300yd. ranges after the president's match is completed on those ranges. The same rule will apply to the 500 and 600yd. ranges.

The above order may be changed by the executive officer. In case of a change being made due notice of same will be posted on the bulletin board.

Rules and regulations governing the competitions, and blank forms for entries, may be secured by addressing Lieut. Albert S. Jones, Post-Adjutant, Sea Girt, N. J.

Trapshooting.

If you want your shoot to be announced here send a notice like the following:

Fixtures.

- July 27.—Norwich, Conn., Shooting Club target tournament. I. P. Taft, Sec'y.
- July 27.—Sandusky, O., Gun Club tournament.
- July 27-28.—Avon, N. Y., Gun Club tournament. Jay Greene, Sec'y.
- July 27-28.—Grand Forks, N. D.—The Interstate Association's tournament, under the auspices of the Grand Forks Gun Club. W. M. Ferguson, Sec'y.
- July 28.—Richmond, Mo.—Missouri League of Trapshooters.
- July 28-30.—Newport, R. I.—Aquidneck Gun Club two-day tournament. J. S. Coggeshall, Sec'y.
- July 30.—Chicago, Ill., Gun Club tournament.
- Aug. 2-5.—Love Point, Md.—Malone's summer tournament; targets and live birds and added money. Capt. James R. Malone, Mgr., 2671 Pennsylvania avenue, Baltimore.
- Aug. 4-5.—Fairmont, Minn., Gun Club tournament.
- Aug. 9-10.—Litchfield, Ill.—Consolidated Trapshooters' Congress.
- Aug. 9-10.—Birmingham, Ala.—Alabama tournament.
- Aug. 9-12.—West Baden, Ind.—Indian tournament; \$1,000 added money.
- Aug. 10-11.—Allentown, Pa.—Two-day target tournament at Duck Farm Hotel. C. E. Kramlich, Mgr.
- Aug. 10-11.—Rolling Fork, Miss., Gun Club tournament.
- *Aug. 10-11.—Bradenville, Pa., Rod and Gun Club.
- Aug. 10-12.—Little Rock, Ark.—Arkansas State Sportsmen's Association tournament. Paul R. Litzke, Sec'y.
- Aug. 11-12.—Olean, N. Y., Gun Club two-day tournament. B. D. Nobles, Sec'y.
- Aug. 10-12.—Brantford, Ont.—Dominion of Canada Trapshooting and Game Protective Association's fourth annual tournament. A. B. Cutcliffe, Sec'y.
- Aug. 15-20.—Buffalo, N. Y.—New York State shoot.
- Aug. 15-17.—Detroit, Mich.—Michigan Trapshooters' League. Jacob Klein, Sec'y.
- Aug. 23-24.—Chattanooga, Tenn.—Target tournament of the Mountaineer Gun Club; \$200 added. S. B. Lowe, Sec'y.
- Aug. 23-24.—Raleigh, N. C.—North Carolina Trapshooters' Association tournament.
- Aug. 23-24.—Renovo, Pa.—Recreation Gun Club two-day target tournament. Geo. B. Dechant, Sec'y.
- Aug. 24-25.—Hot Springs, S. D.—The Interstate Association's tournament, under the auspices of the Hot Springs Gun Club. H. A. Gayhart, Sec'y.
- *Aug. 25-26.—Tarentum, Pa., Rod and Gun Club.
- Aug. 24-26.—Grand Rapids, Mich.—Consolidated Sportsmen's Association tournament. A. B. Richmond, Sec'y.
- Aug. 30-31.—Traverse City, Mich., Rod and Gun Club tournament. W. A. Murrel, Sec'y.
- Sept. 5.—Lowell, Mass., Rod and Gun Club Labor Day tournament. E. J. Burns, Sec'y.
- Sept. 5.—Auburn, N. Y.—Labor Day tournament. Knox and Knapp, Mgrs.
- Sept. 5.—Ossining, N. Y., Gun Club fourth annual Labor Day tournament. C. G. Blandford, Capt.
- Sept. 5.—Dover, N. H., Sportsmen's Association annual Labor Day tournament. D. W. Hallam, Sec'y.
- Sept. 5.—Springfield, Mass.—Fall tournament on Labor Day; \$25 added. C. L. Kites, Sec'y.
- Sept. 5-7.—Richmond, Va.—Tournament of Virginia Trapshooters' Association. W. A. Hammond, Sec'y.
- *Sept. 6-7.—Irwin, Pa., Rod and Gun Club tournament.
- Sept. 6-7.—Litchfield, Ill.—Consolidated Trapshooters' Congress tournament. L. A. Cummings, Sec'y, Bunker Hill, Ill.
- Sept. 9-11.—Chicago, Ill., Trapshooters' tournament. E. B. Shogren, Sec'y.
- *Sept. 14-15.—Ruffsdale, Pa., Rod and Gun Club.
- Sept. 14-15.—St. Louis, Mo.—Afro-American Handicap. T. H. Cohron, Sec'y, Pleasant Hill, Mo.
- Sept. 22.—Moberly, Mo.—Missouri League of Trapshooters.
- *Sept. 27-28.—Monessen, Pa., Gun Club.
- Sept. 28-29.—Concordia, Kans.—The Interstate Association's tournament, under the auspices of the Concordia Gun Club. L. S. Myers, Sec'y, Elmer E. Shaner, Mgr.
- *Oct. 4-5.—Allegheny, Pa.—North Side Gun Club.
- Oct. 18-19.—Litchfield, Ill.—Consolidated Trapshooters' Congress.
- Oct. 18-20.—New London, Ia., Gun Club tournament. Dr. E. C. Cook, Sec'y.
- Nov. 1-3.—St. Louis Mo.—World's Fair shoot; live birds and targets. Alec D. Mermod, Mgr., 620 Locust street.
- *Western Pennsylvania Trapshooters' League tournaments. C. G. Grubb, Sec'y, Pittsburg.

DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have published. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York. FOREST AND STREAM goes to press on TUESDAY OF EACH WEEK.

The date of the North Carolina Trapshooters' Association tournament has been changed from Aug. 9-10 to Aug. 23-24.

The County Gentleman (England) presents the following interesting information, at a juncture when the prices of meat are onward and upward: "In hot weather we are advised to eat little meat. But do we eat much at any time compared with the true meat-eating races, such as the peons of the plains of La Plata or the cowboys of the North American prairies? Mr. Fountain says of the latter: 'There is no air like the prairie air, no tonic to compare to it. It is a common thing for a man to eat a dozen pounds of meat in a day (some eat twenty pounds) and feel the better for it. I have experienced that life on the prairies increases a man's strength twenty or thirty per cent. You soon feel as if there were no limit to your physical powers. You feel that to lift an ox would entail but a trifling exertion of muscular power, and the saying 'O king, live forever!' loses its eastern exaggeration in your estimation.'"

L. A. SCORFIELD, Sec'y C. G. C.

Great Western Handicap.

(Concluded from page 83.)

Denver, Colo., July 16.—The third day wound up the target programme, which led up to the big event. The scores made gave the committee foundation for allotting the handicaps.

On the shooting form, John Garrett was the favorite, while A. J. Lawton, also of Colorado Springs; Wm. Clayton, of Kansas City, and Chas. Younkman, of Denver, were close up.

One Fritz Gilbert did a little stunt on Thursday. Being placed on the 22yd. mark, he got pretty much foxy and smashed up 83 mud pies for a world's record. He missed but 21 out of 600 from the 22yd. mark. Hirschy came second and Budd third among the experts.

Among the amateurs, there was, as before-mentioned, Garrett, Clayton, Lawton and Younkman at the top.

The scores for Thursday:

Targets	15	15	20	15	20	15	15	25	15	20	Broke.
Hirschy	14	13	20	15	19	14	15	18	13	15	186

The leaders in the average for the three days were:

Experts.	First Day.	Second Day.	Third day.	Total.
Fred Gilbert	194	191	194	579
H C Hirschy	186	182	186	554
C W Budd	185	178	180	550
Amateurs.	181	196	184	561
J W Garrett	184	191	186	561
A F Lawton	189	188	181	558
C Younkman	190	186	180	556

Friday saw the close of the week's pleasurable outing, with perfect weather and a great crowd of spectators though only forty shooters took part.

The day was of the made-to-order kind; just a little breeze occasionally that was a welcome relief from the hot sun's rays.

The scores herewith, while showing a total of 200, include three matches. First 50, the Coyd Park cup; second 50, the Lefever gun, and the last 100 the handicap.

The first events found Plank shooting strong, and he won the Lefever gun after a tie with McGee, in which the Kansas City man relinquished his right.

The handicap was started at 2:30, with the professionals shooting for averages only, and with the understanding that the highest amateur was to win.

The surprise of the contest was the poor shooting of Garrett, yet 21yds. was a long distance for him. He stated before the shoot started that he was not up to form.

The first round of 20 wound up with only Budd and Anderson straight. Plank lost 2, George Maxwell, 3, Plank did not get going until his last 40, which he went straight, and thus a total of 94. Maxwell, with only one hand, duplicated the above, and with a 20 on the second round, finished with 94, a remarkable score. With Anderson it was different. He lost but 2 out of first 60, then 4 out of last 40, and thus a tie.

Old man Budd was in a class by himself with 93. Lawton was the only 92, and Gilbert with 91. Hirschy, Clayton and Younkman got into the 90 hole.

The shoot-off was one of the hottest ever known, and was very similar to the G. A. H.; yet the shooting was better. All three tied on 19 out of first 20. In the second round Anderson and Plank went straight, while the one-armed man lost out, possibly tiring with the strain. Starting on the third string, both seemed cool and deliberate, yet Plank was first to lose, then it was thought a sure thing for the Kansas man. Soon Anderson missed, and then Plank wound up and ran out straight, while Anderson failed on the eighteenth.

Thus did young Plank, who is but twenty-six years old, a clerk in Denver, win the handsome trophy, and the honor and cash that go with it.

The scores for the handicap: Hirschy 90, Plank 94, Heirgood 83, Bieser 87, King 83, Budd 93, Riehl 85, Garrett 84, Lawton 92, Rohrer 89, Sievers 89, Mann 79, G. Maxwell 94, Jones 85, Mackie 92, Gilbert 91, O'Brien 87, Cunningham 78, Gottlieb 86, Skelley 71, Huddleson 70, Clayton 90, McGee 89, Younkman 90, Waddington 78, Anderson 94, Randall 89, Razee 78, Stone 81, Tipton 75, Miller 87, Hill 85, Murray 81, Campbell 87, Gooden 85, Tallman 78, Maxwell 83, Harvey 83, Radford 86, McKenzie 78.

Scores for the day with the handicaps.

Charlottesville Tournament.

CHARLOTTESVILLE, Va., July 22.—The Charlottesville and University of Virginia Gun Club held its fifth annual tournament on July 20 and 21. The shoot was managed in a most acceptable manner by the veteran trap shot, Mr. Geo. L. Bruffey. He was assisted materially by the squad from Lynchburg and especially by Dr. W. W. Dennis.

Shooters were in attendance from many Virginia towns, Charlotte, N. C., and Washington, D. C. The Waynesboro club had the largest representation present, followed by the Lynchburg club. Mr. W. A. Hammond, of Richmond, Va., secretary of the Virginia Trapshooters' Association, was among the visiting shooters, and did some missionary work for the State shoot, which is to be held in his city in September—opening on Labor Day, September 5, continuing through the 6th and 7th. Mr. Hammond informed the boys that elaborate preparations were being made for their entertainment, and it was expected that the programme, which will be issued soon, will give general satisfaction. Mr. Hammond not only talks well, but shoots well. On the first day he won the handicap event for a Winchester gun from the 20yds mark, scoring 23 out of a possible 25. On the second day he won high amateur average, scoring 147 out of a possible 160 targets.

The following manufacturers' agents were present, and their presence had much to do with the success of the shoot: Col. J. T. Anthony, S. T. Baskerville, J. M. Hawkins and E. H. Storr. The programme consisted of eight 20-target events for merchandise prizes, and a handicap event each day for a Winchester gun. Col. Anthony won high average for the professionals on the first day, while Mr. W. R. Winfree, of Lynchburg, won high amateur average and also the money for the longest run—29 targets. Mr. S. T. Baskerville won the high professional average for both days, scoring 287 out of a possible 320. Mr. E. H. Storr was only one bird behind Mr. Baskerville and secured the second average, while Col. Anthony won third place. Mr. J. M. Hawkins was out of form and sick, but shot the programme through, landing in fourth place among the professionals.

On the second day, Dr. Dennis won the prize for the longest run—32 straight. On this day Geo. L. Bruffey, of the home club, won the handicap event for the gun, scoring 24 out of 25 from the 20yds. mark. His shooting was excellent.

The young ladies of the Methodist Episcopal Church furnished a substantial lunch, which was much enjoyed.

The shoot was a very pleasant affair and passed off without a hitch or a jar (though the boys were jarred by the hard shooting), thanks to Mr. Bruffey's diplomacy, and all departed for their home feeling that it was good to have been there.

The following are the scores:

First Day, July 20.

Shot at.	Broke.	Shot at.	Broke.
Anthony	160	Link	160
W. R. Winfree	160	W. F. Hall	160
Baskerville	160	Winn	160

Anthony	160	Payne	160
Taylor	160	Irvine	160
George	160	Harrison	160
Sillings	160	Wayman	160

Boston Gun Club.

Boston, Mass., July 20.—The last serial prize shoot of the Boston Gun Club for 1904 was held at Wellington to-day, and though a small attendance, it turned out to be an enthusiastic one. Just ten events were shot off, and the interest never waned till the last shot was fired and guns and shells were packed up for other fields to conquer, which, we understand, is on the programme for some of the members.

The scores tell the story that really is hard to break; but if old Bill Jones had been alive, he would have changed his usual remark and admitted that the shooting was extremely difficult and the scores were large, considering the conditions. One shooter, however, was in his element and shot for 82 per cent, and easily led in all the matches and making a good impression with the scatter gun for his first experience over a magazine trap. Worthing was second, running a race with Frank; and, annexing a few targets on the last two events, turned out to be the necessary article. Frank, however, intends to get back at the earliest opportunity, and won't be satisfied till the time comes.

In the serial match finished to-day, the oldest member of the club proved to be just too good for the younger generation, filling out his scores with a 91, two targets to the good of Bell with 89. No one, however, deserves it as much, for it was the result of careful and steady shooting and proves that the old reliables can still show the new models just a little about shooting. Second position was taken care of by Bell, the winner of first in the previous series, with Frank trailing just far enough back to see daylight between them. Next in line came Worthing, with one target better than Kirkwood, who in turn lead the Cambridgeport Burns by three targets. Muldown and Lee fought it out for the next two positions, Muldown ending with a good lead and fully satisfied. Other scores:

Events:	1	2	3	4	5	6	7	8	9	10	Av.
Targets:	10	15	10	15	10	15	10	15	10	25	
Frank, 19.....	9	12	7	12	6	13	4	15	5	15	.726
Straw, 16.....	7	5	4	3	5	8	6	10	4	16	.504
Worthing, 16.....	8	12	7	11	10	9	9	11	8	17	.256
Blinn, 16.....	8	10	8	12	7	8	6	12	3	13	.645
Lee, 16.....	4	7	3	8	6	8	4520
Muldown, 16.....	6	9	4	11	5	4495
Bryant, 16.....	6	7	6	10	9	3529
F. Caveichi, 16.....	9	12	9	13	8	12	8	11820
Williams, 16.....	5	9	7	9	5	8	7	11610
Bell, 20.....700
E. Caveichi, 16.....560

Merchandise match, 25 unknown, distance handicap: Caveichi (16) 20, Frank (19) 19, Worthing (16) 19, Bell (20) 15, Blinn (16) 15, Lee (16) 14, Straw (16) 13, Williams (16) 13, Bryant (16) 12, Muldown (16) 9.

Team match, 25 targets per man, three men per team:

Worthing	9	11—20	Frank	4	15—19
Caveichi	8	11—19	Straw	6	10—18
Williams	7	11—18—57	Blinn	6	12—18—53

Final scores in series ended:

Kirkwood, 19.....	23	21	20	18—82	Bryant, 16.....	16	14	13	12—55

Cleveland Gun Club.

CLEVELAND, O., July 22.—Editor Forest and Stream: Kindly give space in your next issue to the following: The Cleveland Gun Club, Cleveland O., will hold its twenty-fourth annual tournament Monday (Labor Day), September 5, 1904, at the club's shooting park, stop 16a, Mayfield road. The programme will consist of ten events, eight of 15 targets each, for cash prizes, entrance \$1 in each event, and two events of 10 targets each for merchandise

prizes, entrance 75 cents in each event. Division of purses shall be by percentage system, 30, 25, 20, 15 and 10 per cent. Interstate Association rules shall govern all events. Price of targets shall be 2 cents each, included in entrance fee. Manufacturers' agents are invited to shoot for price of targets only. Merchandise prizes will be awarded to the thirty high and the five low guns. Shooting will commence at 9 o'clock A. M., but the entry list will be held open until noon. Last year there was an average entry of over sixty in each event, and a larger entry is expected in this tournament. Special events will be held in connection with this tournament and the details of said events will be announced in programme. The Cleveland Gun Club is making arrangements to take care of a large crowd, and it is expected that this proposed tournament will be the most successful in the history of that organization. Programmes will be ready for distribution about August 15. Any information desired in relation to this proposed tournament can be obtained from the Cleveland Gun Club Co., 15 Craw ave., Cleveland, O.

F. G. HOGAN, Prest.

Awosting Gun Club.

NEW PALTZ, N. Y.—The Awosting Gun Club held a successful tournament on July 15, thirty-six shooters being in attendance. Mr. H. H. Valentine, of Albany, was high man in the third event, winning a handsome \$10 gun case. Harry is not only a good shot but he is very popular. Capt. Blandford, of the Ossining team, was a close second, winning the shooting jacket. Mr. Blandford also won first average. Ike Tallman, who generally gets his share and a little more quite often, won second average, and Mr. Valentine third average. Capt. Traver, of the Poughkeepsie team, who has been shooting in fine form lately, fell off in his average. The low scores in the eighth event were caused by the rubber on the trap getting out of order while first squad was shooting, consequently all the eighth event was shot in same condition except the last squad, which was not in for the money.

The Marlboro team has not been beaten but once or twice before since their organization in 1896. A number of veteran shooters were loud in their praise of our shooting grounds, saying it

CINCINNATI GUN CLUB TOURNAMENT—JULY 16, 1904.

Indians seated on ground in front. Trade representatives in second row.

could not be beaten anywhere. Moore, of the local team, did some good work, considering his short experience.

George Ginn and Mr. Briggs, trade representatives, were present.

There is a great deal of enthusiasm springing up in this vicinity over trapshooting. The third event was an interesting one both to the shooters and to the large crowd present, and especially so to the ladies, who were present in large numbers. Some were watching their husbands, while others had their eyes on their best fellows, and their exclamations of "Oh, my!" when a target was missed, could be heard quite frequently. The team shoot between the Marlboro, N. Y., Gun Club and the Awosting Gun Club was also decided in the third event. The scores:

Events:	1	2	3	4	5	6	7	8	9	10	11	Shot at.	Broke.

Marlboro—Baxter 19, Kaley 13, Rhodes 22, W. Brown 18, McConnell 13, Hunter 14, Lockwood 14, L. Brown 18; total 131.
Awosting—Johnston 16, Moore 19, Traver 19, Bissing 16, Strong 13, Cassady 15, Snyder 20, Slater 20; total 138.

Cincinnati Gun Club.

THE Cincinnati Gun Club house and grounds are slowly being restored to the normal condition, and many of the members who went out there on July 25 preferred sitting on the veranda talking over the events of the tournament just closed and watching the work to shooting. They had enough for a few days. The weather was delightful.

In the shoot to-day high gun in actual breaks was Peters, with 92. Peters is certainly doing excellent work, and will give Barker, Medico, Gambell and the other cracks of the club a run for their money if he continues at his present gait.

Parker prize gun shoot, 100 targets, handicap of added targets: Peters (20) 100, Herman (30) 100, Joe H. (40) 100, Smith (40) 100, Andrews (60) 100, Williams (18) 99, Maynard (18) 98, Jay Bee (25) 95, Davies (23) 91.
BONASA.

IN NEW JERSEY.

Montclair Gun Club.

Montclair, N. J.—Only six or seven members put in an appearance at the grounds of the Montclair Gun Club at the regular weekly shoot on Saturday, July 23; but in spite of the slim attendance, which is due to the fact that most of the members are away, a very pleasant afternoon was spent. Scores follow:

Events:	1	2	3	4	5	6	7	8
Targets:	50	25	25	25	25	25	22	50
Kendall	37	23	29	21	19	21	13	47
Cockfair	38	20	20	17	21
Glaister	14	14	18
Hartshorne	14	9	16	12
Holloway	13	15	20
Wheeler	11	13	43

Event No. 7 was at doubles.

S. WHEELER, Treas.

Bound Brook Gun Club.

BOUND BROOK, N. J., July 21.—At our regular club shoot on July 16 at 2-P. M., Mr. Stelle won the main event, the Pardoe cup. The permanent holder of this cup must win it three times in succession, which is naturally a hard thing to do. Mr. Dunning almost won it. He had two handles, but could not get the third. Dr. Pardoe donated a medal, which was won by Martin, on 8 out of 10. Dr. Bache did good work in sweeps, making the only straight score.

Cincinnati Gun Club Tournament.

THE Cincinnati Gun Club third annual handicap tournament at targets was held on July 19 to 22, inclusive. The club was favored with excellent weather through the week, and the affair was a success except in point of numbers, which fell below the expectation of the management.

The club erected a large fly tent, 90ft. long, between the regular trap pits, for the accommodation of spectators and shooters. Three other tents were pitched on the grounds, one of which belonged to the Peters Cartridge Co., and one to the Austin Cartridge Co. The trade was represented by Messrs. O. E. Peters, W. E. Keplinger, F. C. Tuttle, Geo. G. King, J. S. French, Harry L. King, Frank See, E. R. Cray, D. D. Gross, L. I. Wade, J. E. Reid, C. M. Peters, Milt Lindsley, R. L. Trimble, W. R. Crosby, A. M. Ruter, T. A. Cassety, C. Spencer, Harold Money, Jas. M. McBreen, J. L. Head, Wm. Heer, R. O. Heikes, T. Marshall, T. D. Priddy, Geo. T. Little, A. C. Barrell, Capt. A. W. du Bray, C. O. Le Compte, L. J. Squier and Chas. Dreihls.

The tournament committee consisted of J. B. Mosby, chairman; A. B. Heyl and Herman Jergens; and these gentlemen are entitled to great credit for the admirable way in which every detail of a big shoot was arranged. That a larger crowd was not present was not due to any lack of effort on their part, and they certainly were ready and able to have handled many more shooters than took part in the sport.

The field force, marshaled by Supt. Gambell, did their work well. At set No. 1, Leonard Shepard, referee and scorer; Stamm puller; Boeh hustler. No. 2, Devire referee; Nasse scorer; Dury puller; Russell hustler. No. 3, Barnes referee; Fay scorer; Drusty puller; Lutie Gambell hustler. No. 4, Ed Trimble referee; Doc scorer; Peter puller; Schwegmann hustler. No. 5 Due referee; Du Bray scorer; Pelling puller; Stanley hustler.

The shooting was done over five sets of expert traps, Sergeant system, arranged in a curve, and throwing clipper targets. No. 1 set faced north; No. 2 northeast; No. 3 east; No. 4 southeast and No. 5 south.

Work in the office was efficiently attended to by the following force: A. B. Heyl and J. B. Mosby in charge; Mr. McConaughy chief clerk, Mr. Coleman assistant clerk, Mr. Houston compiler of scores. Scores were compiled and copies ready for the press representatives soon after the close of each day's programme, and every courtesy was extended to them by Messrs. Heyl and Mosby, who were never too busy to give any desired information. Money was ready for the winners within thirty minutes after the close of the shooting each day.

Monday, July 18, the grounds were open for practice, and many of the members and visitors availed themselves of the opportunity, thirty-eight shooting in the various events.

The weather was extremely hot, with very little air stirring. Some good scores were made, Ad. Roll breaking 93 out of 100.

First Day, July 19.

The opening day of the tournament was another scorcher, although there was a trifle more wind than on Monday. Early in the afternoon a severe squall of wind and rain delayed the shooting for about twenty minutes, and cooled the air a trifle, so that the remainder of the day was a little more endurable. One hundred and ten shooters took part, a very large per cent. shooting the entire programme.

The targets were exceptionally hard ones, and the scores made were not up to the average. The programme called for five events at 15, four at 20 and one at 25 targets, the last being for a guaranteed purse of \$400.

Ed O'Brien, of Florence, Kans., was high gun, with 161 out of 180. Money and Scott tied for second on 160 each. In the purse event, W. Henderson of Lexington, was first, with 25 straight. The scores:

Event No. 6, 25 targets, entrance \$4.50; purse \$400 guaranteed, and all surplus added; forty-two high guns, \$40 to first, \$33 to second, \$25 to third, \$20 to fourth, \$15 to fifth, \$12 to sixth, \$10 to seventh, \$9 to each of the next nine, \$7 to each of next eleven, \$3 to each of the next nine, and \$5 to each of the next five. Surplus: The first \$4.50 to \$45 will be used to create from one to ten moneys, for low guns, \$4.50 each; all other surplus to be divided pro rata between the thirty-two high guns; distance handicap: Henderson (16) 25, Peters (16) 24, Money (20) 24, Merrick (16) 24, Scott (17) 24, Peck (17) 24, Miller (16) 24, Gambell (16) 23, Partington (17) 23, J. July 21, Third Day.

Thursday was somewhat cooler, but was not very favorable for shooting. There were heavy, low-lying clouds in the horizon, and a strong wind from the right, which made hard targets. Many of the scores, however, were better than on previous days. The attendance was smaller than on Tuesday, seventy-five shooters taking part in the different events. The first shot was fired at 10:30, and about 2:30 the regular programme was finished. The balance of the day was devoted to special sweepstake events by those of the shooters who could not get enough of the sport.

The programme called for five events at 15 targets and five at 20 targets. These last constituted the match for \$1,000 guaranteed purse. L. Wade, of Texas, and Geo. Volk, of Toledo, were second with 160 each. Taylor third, with 159.

L. J. Squier and Dr. E. E. Sample tied for first in the big purse event on 93, and divided the first two moneys. Geo. Volk, of Toledo, was second with 92.

Events 6, 7, 8, 9 and 10, Grand International Handicap, 100 targets, entrance \$14. Purse, \$1,000 guaranteed, and all surplus added. Forty-two high guns, \$100 to first, \$80 to second, \$60 to third, \$50 to fourth, \$40 to fifth, \$30 to sixth, \$20 to each of the next ten, \$18 to each of the next six, \$17 to each of the next ten, \$15 to each of the next six. Surplus: The first \$14 to \$140 will be used to create from one to ten moneys for low guns, \$14 each. All other surplus will be divided pro rata between the thirty-two high guns. The scores: Squier (20) 93, Sample (16) 93, Volk (17) 92, Money (21) 91, Taylor (17) 91, Ward (17) 91, Wade (17) 91, Barker (17) 90, Heer (20) 90, Snow (18) 90, Henderson (18) 92, Mason (16) 90, O'Brien (17) 89, Anderson (17) 88, Hatcher (16) 88, Reid (16) 88, Worden (16) 88, Harig (17) 89, Blunt (16) 87, Gottlieb (16) 87, Rike (18) 87, See (17) 87, Clay (18) 86, Young (20) 86, Sundry (16) 85, Daudt (16) 85, Heikes (20) 85, Crosby (22) 85, Pinney (16) 85, Craig (17) 85, Mink (17) 85, Keller (16) 84, Head (18) 84, Brady (18) 84, Mcaders (16) 84, Scott (17) 84, Merrick (6) 84, Alkire (18) 83, Lang (16) 83, Speary (17) 83, McCune (16) 83, Barto (17) 83, Peck (17) 83, Traver (16) 83, Lindermuth (17) 83, Dick (16) 82, Roll (17) 82, Trapp (16) 82, Herman (16) 82, Grau (18) 82, Marshall (19) 81, Carrier (16) 80, Medico (16) 80, Dimick (16) 80, Spencer (21) 80, Gross (16) 80, Le Compte (20) 80, Trimble (20) 79, Peters (17) 79, Bibbee (16) 78, Linn (16) 78, McHugh (16) 78, Gambell (17) 77, Pohlar (16) 77, McDaniels (16) 77, Potter (16) 76, Shattuck (16) 76, Pfeiffer (16) 76, Ahlers (17) 74, J. July 22, Fourth Day.

Friday, the closing day of the tournament, was cool, with a light north wind in the morning. Toward noon the breeze increased, and for a time made the targets soar badly, and few good scores were made on No. 2 set. Later in the day it became almost calm and much warmer.

The attendance was very small, most of the shooters having left the city the night before, and only thirty-four took part in the events. The committee changed the programme to ten 20-target events, \$2 entrance, money divided 40, 30, 20 and 10 per cent. All shooting to-day was done over sets 2 and 3, and although late in starting, the ten events were finished about 3 o'clock. There were few spectators present.

After the programme was finished several special events were shot, and the traps were kept busy until dark.

The office force had their part of the work finished early, and the cashier paid off all winners who presented their orders. No one had to wait.

The boys all agreed that they had enjoyed themselves, and commended the management of the tournament, which left nothing to be desired. The scores made to-day were the best of the week. Quincy Ward, of Austerlitz, was high, with 186 out of 200. Anderson second, with 184. Crosby third, with 181. Tom Marshall fourth, with 179. The scores:

Events:	1	2	3	4	5	6	7	8	9	10	Shot	
Targets:	20	20	20	20	20	20	20	20	20	20	at.	Broke.

REARING WILDFOWL.

SOONER or later the subject of the domestication and artificial rearing of game birds and wildfowl is quite sure to take an important part in the thoughts of American sportsmen. It is time now that the matter should receive consideration, and that sportsmen all over the country should do their part toward pushing forward an idea which ultimately is certain to be generally taken up and when taken up to greatly benefit those who use the shotgun.

As has already been said, wild ducks are artificially reared in various parts of England, and on a considerable scale. For example, Sir Richard Graham on his estate at Netherby in Cumberland has reared 10,000 wild ducks in a season. Only 200 or 300 wild ducks are kept to lay, which they do chiefly in the woods, nesting in a natural manner. The remainder of the eggs are imported from the counties of Hertfordshire and Norfolk, from which come 7,000 or 8,000 eggs, carefully packed with hay in baskets in lots of about 100.

When they reach their destination, they are given over to keepers and helpers, separated and set under hens, 12 eggs to a hen. Incubators have been used, but since it is necessary to give the ducklings to a mother to brood, there is no special gain in the use of incubators, except that these are sometimes useful for weak young birds when first hatched.

While the hens are setting, a large grass field is selected, carefully fenced with wire to keep out vermin, and the coops for the 300 hens are put out in the field. As each brood hatches, the ducklings in baskets with the mother hen are carried to the field, and each family is established in its home. The birds are fed four times a day, and are given water in shallow pans for drinking, but not for bathing. But when about three weeks old, shallow pools only eight or ten feet across are prepared, and in these the ducklings swim, wash, and play. Much of the time of the youngsters is spent hunting for insects through the grass, and as they grow older they are more and more disposed to neglect their foster mothers. Early in life they are fed largely on wetted corn meal, and later eat the whole corn. When about six weeks old the young ducks are moved from the field to the places where they are to be permanently. Three of these duck homes are on streams that run through the estate. One is almost in the center of a wood.

About a hundred years ago large reservoirs were constructed at Tring, and these have always been frequented by wild ducks of various sorts. It is only about fourteen years ago that artificial rearing of ducks began there.

The eggs used are gathered on the spot, and somewhat after the method recently described in *FOREST AND STREAM* as practiced by Mr. George Irwin at Chautauqua Lake fifty or sixty years ago. An area of water, marshy ground, and water plants is inclosed by a netting. Wild birds are trapped, and, having had their wings clipped, are turned loose in the inclosure. The eggs laid are gathered and set under hens, and when the broods are hatched they are taken to their field as already described. At six weeks old these birds are taken to the waterside, and there are still kept in an inclosure. They fly at from ten weeks to three months old. The success had in rearing the wild birds is extraordinary. About 90 per cent. of the eggs hatch, and the birds do not seem to be troubled by any epidemic or disease of any sort.

The success obtained in the cases mentioned has led more and more owners of estates to go into the artificial rearing of wild ducks, and there probably has not been a time within a century when inland wildfowl shooting in Britain was so good as it is to-day. The shooting, except that already described as to "gazes," is largely from what are called "butts"—another form of blind similar to what grouse are shot from—and the shooting is what we in America would call "pass" shooting—that is to say, at birds flying overhead.

What has been done in England can be done in America, and undoubtedly will be, when anybody is sufficiently interested in the matter to take it up in earnest.

For a number of years a few persons in various parts of the United States have been rearing wild ducks and geese for use as decoys, the species chosen being chiefly the mallard, the dusky duck, and the Canada goose. At present an engineer in St. Joseph, Mo., is engaged in breeding wild mallard ducks, which he sells as decoys. Such examples show the entire feasibility of engaging in

the artificial rearing of wildfowl on a large scale, and nothing more is required than an expansion of what has already been put in practice to enormously increase the wild duck supply in the United States. We believe that the artificial rearing of wildfowl on State and National reserves will some day give the gunners of the United States shooting somewhat like that of old times.

THE MONTEZUMA NET SCANDAL.

THE old Montezuma fishing net bounty scandal has come to the front again as an element of local politics. The scandal grew out of the bounty on forbidden fishing nets. In the late 90's, at a time when there was a much smaller force of protectors than now, many persons who were interested in the protection of inland waters from the fish poacher, advocated a law paying a bounty to any person who might seize and destroy nets that were being illegally used. The advocates of the measure urged the matter so strenuously that the old Davis Commission consented to the passage of the measure, and the authorities believed that a sufficient safeguard was placed around the act to prevent any fraud. They found out their mistake, however, within the next eight months, and the act was repealed.

The law provided that a bounty of from \$2.50 to \$10 should be paid on each net, according to size, by the county treasurer, and gave a part to the informant. No sooner was the law promulgated than its revenue yielding possibilities were recognized, and numerous patriots addressed themselves with unbounded enthusiasm to the enterprise of fish protection. Their ingenious scheme was to manufacture nets out of barrel hoops and mosquito netting, and other like inexpensive raw material, the whole affair costing a few cents, and then planting them out in the waters, "seizing" them, and turning them in for the bounties. We have not at hand the figures, but the amounts thus paid out from county treasuries were stupendous. Yates county paid \$20,000, Cayuga \$75,000, Wayne a little less than Cayuga, Monroe \$25,000, and Niagara and Erie "too much to compute." In each instance a town clerk or a justice of the peace was implicated, as the party seizing nets must bring them before one of the two town officials, who gave a certificate to the county treasurer. When the fraud was discovered some of the humbler agents in the scheme went to jail; but the bigger rascals escaped.

THE ROCKY MOUNTAINS PARK.

The Rocky Mountains Park originally comprised but a small territory, but it has recently been so much enlarged that now it equals in area the States of Connecticut and Rhode Island, and is thus about two-fifths larger than our Yellowstone Park.

It is a startling rebuke to the United States that while we have been talking vaguely about the importance of enlarging the Yellowstone Park, of setting aside game refuges in the forest reserves, and of doing various other things of great importance, the Canadians, without saying anything about it, have more than twenty times enlarged the area of their National Park, and have set on foot in it a zoological garden, or animal paddock, which must be quite as interesting as the one we have in the Yellowstone. Americans, Canadians, and all others interested in preserving untouched the few genuinely wild spots that still remain on this continent, will read with interest Mr. Douglas's account of the Rocky Mountains Park.

LOST ARTS.

A CHAPTER might be written on the lost arts in the field of sports. Some have been lost because the game on which they were practiced has disappeared. No one shoots wild pigeons nowadays because there are no pigeons to shoot; nor runs buffalo because there are no buffalo. Wild turkey shooting and antelope hunting are among the arts that are obsolescent because the game is so scarce or is so closely protected that few can take part in its pursuit. Other arts have been lost because, being no longer approved by public sentiment nor consonant with the desirable protection of species, they are prohibited. Among these are the hounding of deer and deer jacking, or hunting with a light at night. It is within the memory of the older deer hunter that jacking on the Adirondack lakes and hounding in many sections of the country favorable to that pursuit, were commonly prac-

ticed, and were regarded as perfectly legitimate means of game winning. Now they have disappeared so widely that the great majority of the younger sportsmen know nothing of them except by hearsay from their elders. In place of deer jacking we have a new art of flash-lighting the game with a camera; and of this latest development in the pursuit of the wild creatures, it may be said that it requires for its success more skill, exacts more patience, and yields a more lasting reward, than the old art of night hunting with a gun. There is pictured in our supplement this week a very happy achievement of the night hunter of deer with a camera.

RIFLE, AX AND PLOW.

As a complement of the squirrel barking discussion, we have transcribed Audubon's account of the "Kentucky Sports" of his day; and next week will be given his relation of another meeting with Daniel Boone, this time in Missouri. These pictures of early pioneer life are extremely interesting. They bring before us vividly a hardy race of adventurous and bold spirited men, in whose hands the rifle was only incidentally an implement of sport, but primarily and chiefly one of actual everyday usefulness and necessity. It was the rifle and the pioneer's knowledge of how to use it that made possible the exploration and settlement of the continent. The advancing hosts lived on the country. If they had not known how to shoot, and to shoot true to the mark, the subjugation of the wilderness and the forward movement of the line of settlement westward and to the southwest would have progressed but haltingly. With the rifle of the pioneer went the ax and the plow. All three were homely, prosaic tools devoted to a common purpose; and each contributed its share to the marking out of Territories and the up-building of States. We are accustomed to regard rifle shooting for the most part in its relation to warfare; but the rifleman of to-day who emulates the skill of these former generations of sharpshooters, is practicing a sport which will always have a high place in American esteem because of the part it had in the development of the continent in times of peace.

A MINNESOTA DECISION.

THE Minnesota Supreme Court has just handed down a decision which has been awaited with genuine anxiety by the authorities. It had to do with the constitutionality of the statute providing for cumulative penalties for the illegal possession of game. The two defendants had been fined \$20,000 each, and one of them 300 days in jail and the other 200 days. The penalties they claimed to be excessive; and it was contended in their behalf that the possession of 2,485 ducks should be held a single offense, and that the law should be construed to attach to it the single penalty of \$10. The statute, however, specifically makes the fine from \$10 to \$25 for each bird, and the Supreme Court, in sustaining the lower courts, has upheld the constitutionality of the law. Executive Agent Fullerton regards this outcome of the case as one of the most important events in the history of game protection in Minnesota. It is not difficult to imagine what the anti-sale law would amount to if for thousands of ducks in possession the penalty were but a paltry \$10 fine. There is, by the way, no more enthusiastic advocate of the *FOREST AND STREAM* Platform Plank than Agent Fullerton, who has witnessed in his own State the beneficial effect of the law forbidding at all seasons the sale of certain game.

THE movement by certain clubs which have their hunting grounds in Canada to improve their guide service is progressing. The plan is outlined in the circulars printed on page 115. That letter of instruction and information for guides is manifestly written from a full experience in the wilds with guides good and bad; and it deserves the wider circulation here given to it. No one can read it without realizing anew how much the guide has to do with the pleasure of a hunting trip. Much of the instruction given in the nine paragraphs—in particular that relating to the keeping of the camp—is pertinent for the amateur camper, and may well be adopted as rules to govern an outing in the woods.

MR. W. B. MERSHON complains of the disappointing scarcity of salmon this year on the Cascapedia. We would be glad to hear from other rivers as to the salmon supply and the agencies affecting it.

THE SPORTSMAN TOURIST

Trails of the Pathfinders.—XIII.

Zebulon H. Pike.—I.

SIDE by side in fact—though by no means in popular estimation—with the heroic explorers, Lewis and Clark, stands Zebulon M. Pike, the young soldier, who first reached the sources of the Mississippi, later those of the Arkansas, and who was one of the first genuine Americans to see the Spanish City of the Holy Faith. Born in New Jersey in 1779, Pike entered the army in his father's regiment about the year 1794. In July, 1805, a lieutenant, he was detailed, by order of General James Wilkinson, to explore the sources of the Mississippi. From this expedition he returned in 1806, and shortly afterward set out on an expedition up the Kansas River to the country of the Osages, and thence to the Kitkahahk village of the Pawnees, then on the Republican River. From here he went westward to the sources of the Arkansas River, in what is now Colorado. On this expedition he approached Santa Fé, was taken by the Spaniards, and was escorted south through Mexico and what is now Texas to the Spanish-American boundary on the borders of the present State of Louisiana, where he was set free.

It would be perhaps difficult to point out, since Revolutionary times, a more heroic figure than that of Pike, or to name a man who has done more for his country. It is chiefly as an explorer that we must now consider him, and must briefly tell the history of his journeyings for two years through that country which was then Louisiana; yet his subsequent and involuntary wanderings through Mexico and Texas cannot be separated from his earlier travels. Some time after his return from the Southwest, he wrote a book, which was issued four years before the journal of Lewis and Clark. In reviewing his life of exploration, we shall in large measure let him tell his own story.*

On the 9th of August, 1805, with one sergeant, two corporals, and seventeen privates, Pike started from St. Louis up the Missouri River in a keel boat seventy feet long and provisioned for four months. The water was swift, the way hard, and they had much foul weather, which held them back, and made their days and nights uncomfortable. Occasionally they saw camps of Indians fishing, and passed the farm of some Frenchmen, lately transferred without his knowledge or consent from allegiance to old France to citizenship in the new United States.

One of Pike's especial duties was to conciliate the Indians he met, and, so far as possible, to arrange for peace between warring aboriginal tribes. On the 20th he came to a Sac village, where he had a talk with the Indians, who listened to him respectfully, and appeared to agree to what he said. Further along he met villages of the Reynards, or Foxes, showing that at this time the Sacs and Foxes were living separately, though allies.

The way was long, and progress, though often covering thirty or forty miles a day, was slow, owing to the windings of the river. Pike was now approaching that debatable land over which the Sioux and Sauteurs or Ojibwas were continually fighting backward and forward. He tells of meeting, September 1, Mons. Dubuque, who told him that these tribes were then engaged in active hostilities, and, among other things, that a war party "composed of Sacs, Reynards, and Puants (Winnebagoes), of 200 warriors, had embarked on an expedition against the Sauteurs, but they had heard that the chief, having had an unfavorable dream, persuaded the party to return, and that I would meet them on my voyage." This is interesting, as showing that at this time the Sacs and Foxes, who are of Algonquian stock, had allied themselves with the Winnebagoes of Siouan stock, against people of their own race.

Indians were abundant here, and were always on the lookout for enemies. The firing of guns by Pike's party, who had landed to shoot wild pigeons, was the signal for some Indians in the neighborhood to rush to their canoes and hastily embark. Indeed, Pike was told that all the Indians had a dread of Americans, whom they believed to be very quarrelsome, very brave, and very much devoted to going to war; a reputation which had undoubtedly reached the savages through the English and French traders.

A little further along, the Ouisconsin River was reached, and they met the Fols Avoin Indians, the Menominees, a tribe still existing at Green Bay, Wisconsin. Further on he had a meeting with a number of Sioux, and Pike reports the council:

"On the arrival opposite the lodges, the men were paraded on the bank with their guns in their hands. They saluted us with ball with what might be termed three rounds, which I returned with three rounds from each boat with my blunderbusses. This salute, although nothing to soldiers accustomed to fire, would not be so agree-

able to many people, as the Indians had all been drinking, and as some of them even tried their dexterity, to see how near the boat they could strike. They may, indeed, be said to have struck on every side of us. When landed, I had my pistols in my belt and sword in hand. I was met on the bank by the chief, and invited to his lodge. As soon as my guards were formed and sentinels posted, I accompanied him. Some of my men who were going up with me I caused to leave their arms behind as a mark of confidence. At the chief's lodge I found a clean mat and pillow for me to sit on, and the before-mentioned pipe on a pair of small crutches before me. The chief sat on my right, my interpreter and Mr. Frazer on my left. After smoking, the chief spoke to the following purport:

"That notwithstanding he had seen me at the Prairie (du Chien), he was happy to take me by the hand among his own people, and there show his young men the respect due to their new father (President Jefferson). That, when at St. Louis in the spring, his father (General Wilkinson) had told him that if he looked down the river he would see one of his young warriors (Pike) coming up. He now found it true, and he was happy to see me, who knew the Great Spirit was the father of all, both the white and the red people, and if one died the other could not live long. That he had never been at war with their new father, and hoped always to preserve the same understanding that now existed. That he now presented me with a pipe, to show to the upper bands as a token of our good understanding, and that they might see his work and imitate his conduct. That he had gone to St. Louis on a shameful visit, to carry a murderer, but that we had given the man his life, and he thanked us for it. That he had provided something to eat, but he supposed I could not eat it, and if not, to give it to my young men."

"I replied, 'That although I had told him at the Prairie my business up the Mississippi, I would again relate it to him.' I then mentioned the different objects I had in view with regard to the savages who had fallen under our protection by our late purchase from the Spaniards; the different posts to be established; the objects of these posts as related to them, supplying them with necessities, having officers and agents of Government near them to attend to their business; and above all, to endeavor to make peace between the Sioux and Sauteurs. 'That if it was possible on my return I should bring some of the Sauteurs down with me, and take with me some of the Sioux chiefs to St. Louis, there to settle the long and bloody war which had existed between the two nations. That I accepted his pipe with pleasure, as the gift of a great man, the chief of four bands, and a brother; that it should be used as he desired.' I then eat of the dinner he had provided, which was very grateful. It was wild rye [rice] and venison, of which I sent four bowls to my men."

"I afterward went to a dance, the performance of which was attended with many curious maneuvers. Men and women danced indiscriminately. They were all dressed in the gayest manner; each had in the hand a small skin of some description, and would frequently run up, point their skin, and give a puff with their breath, when the person blown at, whether man or woman, would fall, and appear to be almost lifeless, or in great agony, but would recover slowly, rise, and join the dance. This they called their great medicine, or, as I understood the word, dance of religion, the Indians believing that they actually puffed something into each others' bodies which occasioned the falling, etc. It is not every person who is admitted; persons wishing to join them must first make valuable presents to the society to the amount of \$40 or \$50, give a feast, and then be admitted with great ceremony. Mr. Frazer informed me that he was once in the lodge with some young men who did not belong to the club; when one of the dancers came in they immediately threw their blankets over him and forced him out of the lodge; he laughed, but the young Indians called him a fool, and said 'he did not know what the dancer might blow into his body.'

"I returned to my boat, sent for the chief, and presented him with two carrots of tobacco, four knives, half a pound of vermilion, and one quart of salt. Mr. Frazer asked liberty to present them some rum; we made up a keg between us of eight gallons—two gallons of whiskey, the rest water. Mr. Frazer informed the chief that he dare not give them any without my permission. The chief thanked me for all my presents, and said 'they must come free, as he did not ask for them.' I replied that 'to those who did not ask for anything, I gave freely; but to those who asked for much, I gave only a little or none.'

"We embarked about half-past three o'clock, came three miles, and camped on the west side. Mr. Frazer we left behind, but he came up with his two perogues about dusk. It commenced raining very hard. In the night a perogue arrived from the lodges at his camp. During our stay at their camp there were soldiers appointed to keep the crowd from my boats, who executed their duty with vigilance and rigor, driving men, women, and children back whenever they came near my boats. At my departure, their soldiers said, 'As I had shaken hands with their chief, they must shake hands with my soldiers.' In which request I willingly indulged them."

Pike was now journeying through the country passed over forty years before by Carver, and he was evidently familiar with his journeyings. Of La Crosse prairie he says:

"On this prairie Mr. Frazer showed me some holes dug

by the Sioux when in expectation of an attack, into which they first put their women and children, and then crawl themselves. They were generally round and about ten feet in diameter, but some were half-moons and quite a breast-work. This I understood was the chief work, which was the principal redoubt. Their modes of constructing them are, the moment they apprehend or discover an enemy on the prairie, they commence digging with their knives, tomahawks, and a wooden ladle; and in an incredibly short space of time they have a hole sufficiently deep to cover themselves and their families from the balls or arrows of the enemy. They (enemies) have no idea of taking these subterranean redoubts by storm, as they would probably lose a great number of men in the attack; and although they might be successful in the event, it would be considered a very imprudent action."

Heretofore but little food had been killed by the expedition, except pigeons; but they were now getting into a country where there was more or less game. On September 14, Pike, who had gone ashore with three others of his party to hunt, saw abundant sign of elk, but failed to see any of them, though his men saw three from the boat; and from this time forth more or less mention is made of game by short entries, such as, "Saw three bear swimming over the river." "Killed a deer," "Killed three geese and a raccoon," and other similar notes.

On the 23d of September Pike held a council with the Sioux, who, hearing by a rumor of his arrival in the country, returned from a war party on which they had set out. He talked with these Sioux about many subjects, of which the principal one was the granting by the Indians of a site near the Falls of St. Anthony for a military post, as well as the establishment of peace between the Ojibways and Sioux. Three important chiefs named Little Crow, Risen Moose, and the Son of Pinchow, replied, promising him about a hundred thousand acres of land, as well as a safe conduct for himself and such Ojibwa chiefs as he might bring back with him. They were doubtful, however, about the prospects of making a peace with their old-time enemies. The treaty, or grant, was drawn up and signed, and the Sioux returned to their homes.

The following day the flag from Pike's boat was missing. This he naturally regarded as a very serious misfortune. He punished his sentry, and calling up his friend, Risen Moose, told him of the trouble, and urged him to try to recover the flag, for he was not by any means sure that it had not been stolen by an Indian. However, the next day he was called out of bed by Little Crow, some of whose people had found the flag floating in the water below their village, and believing that this must mean that the white men had been attacked, Little Crow had come up to see what the matter was. The appearance of the flag at Little Crow's village had put an end to a quarrel which was in progress between his people and those of a chief called White Goose. Pike says: "The parties were charging their guns, and preparing for action, when lo! the flag appeared like a messenger of peace sent to prevent their bloody purposes. They were all astonished to see it. The staff was broken. Then Petit Corbeau arose and spoke to this effect: 'That a thing so sacred had not been taken from my boat without violence; that it would be proper for them to hush all private animosities until they had revenged the cause of their eldest brother; that he would immediately go up to St. Peter's to know what dogs had done that thing, in order to take steps to get satisfaction of those who had done the mischief.' They all listened to this reasoning; he immediately had the flag put out to dry, and embarked for my camp. I was much concerned to hear of the blood likely to have been shed, and gave him five yards of blue stroud, three yards of calico, one handkerchief, one carrot of tobacco, and one knife, in order to make peace among his people. He promised to send my flag by land to the falls, and make peace with Outard Blanche." The flag was returned two days later by two young Indians, who had brought it overland.

It was now October, and clear weather, the thermometer falling sometimes to zero. Hitherto the principal food killed had been geese, swans, and prairie chickens; but on October 6 Pike saw his first elk—two droves of them. As they kept on up the river, geese, ducks, and grouse, with occasionally a deer, continued to be secured. Frequently Pike found hanging to the branches of the trees sacrifices left there by the Indians. These were sometimes bits of cloth, or articles of clothing, or painted skins. As the weather grew colder, and ice began to be met with, Pike began to think of a place where he should winter. The boats were getting very leaky, and the men, terribly overworked, were losing strength and becoming inefficient. He therefore determined to make a permanent camp, afterward called Pike's Fort, and to leave a part of his men there in block-houses while he proceeded up the river; but before the separation took place, there was much to be done. Happily, the country abounded in game, so that for those who were to be left behind there would be no danger of starvation. Pike went out one morning and killed four bears, while his hunters killed three deer.

Log houses were built, and several small canoes were made for travel on the river. But after his canoes were launched and loaded, one of them sank and wet his ammunition, and in endeavoring to dry the powder in pots he blew up the powder and the tent in which he was

*As an author, Pike shows himself much less expert in literature than he no doubt was on the prairie and among the mountains. He had no skilled historian to write the tale of what he had done, as had Lewis and Clark. He painfully wrote out his own story, and how badly it was done we may learn by a study of the more modern "Expeditions of Zebulon M. Pike," which work was published in 1895, under the able editorship of the late Dr. Elliott Coues. Those who are interested in Pike's explorations must study Dr. Coues' volumes, which for clearness and fullness of historical and geographical data, and for general interest, stand high among the stories of American history.

working. It being necessary to build another canoe, Pike again went off to hunt to a stream where much elk and buffalo sign had been seen. The day following was spent in hunting, but with very little result; and the account which Pike gives of it shows how little the explorer and his party knew about the game that they were pursuing, or the proper methods of securing it. He says: "I was determined, if we came on a trail of elk, to follow them a day or two in order to kill one. This, to a person acquainted with the nature of those animals and the extent of the prairie in this country, would appear—what it really was—a very foolish resolution. We soon struck where a herd of 150 had passed; pursued, and came in sight about eight o'clock, when they appeared, at a distance, like an army of Indians moving along in single file; a large buck, of at least four feet between the horns, leading the van, and one of equal magnitude bringing up the rear. We followed until near night without once being able to get within pointblank shot. I once made Miller fire at them with his musket at about 400 yards' distance; it had no other effect than to make them leave us about five miles behind on the prairie. Passed several deer in the course of the day, which I think we could have killed, but did not fire for fear of alarming the elk. Finding that it was no easy matter to kill one, I shot a doe through the body, as I perceived by her blood where she lay down in the snow; yet, not knowing how to track, we lost her. Shortly after saw three elk by themselves near a copse of woods. Approached near them and broke the shoulder of one, but he ran off with the other two just as I was about to follow. Saw a buck deer lying on the grass; shot him between the eyes, when he fell over. I walked up to him, put my foot on his horns, and examined the shot; immediately after which he snorted, bounced up, and fell five steps from me. This I considered his last effort; but soon after, to our utter astonishment, he jumped up and ran off. He stopped frequently; we pursued him, expecting him to fall every minute; by which we were led from the pursuit of the wounded elk. After being wearied out in this unsuccessful chase, we returned in pursuit of the wounded elk, and when we came up to the party, found him missing from the flock. Shot another in the body, but my ball being small, he likewise escaped. Wounded another deer; when, hungry, cold, and fatigued, after having wounded three deer and two elk, we were obliged to encamp in a point of hemlock woods on the head of Clear River. The large herd of elk lay about one mile from us in the prairie. Our want of success I ascribe to the smallness of our balls, and to our inexperience in following the track after wounding the game, for it is very seldom a deer drops on the spot you shoot it.

"Sunday, November 3.—Rose pretty early and went in pursuit of the elk. Wounded one buck deer on the way. We made an attempt to drive them into the woods, but their leader broke past us, and it appeared as if the drove would have followed him, though they had been obliged to run over us. We fired at them passing, but without effect. Pursued them through the swamp till about ten o'clock, when I determined to attempt to make the river, and for that purpose took a due south course. Passed many droves of elk and buffalo, but being in the middle of an immense prairie, knew it was folly to attempt to shoot them. Wounded several deer, but got none. In fact, I knew I could shoot as many deer as anybody, but neither myself nor company could find one in ten, whereas one experienced hunter would get all. Near night struck a lake about five miles long and two miles wide. Saw immense droves of elk on both banks. About sundown saw a herd crossing the prairie toward us. We sat down. Two bucks, more curious than the others, came pretty close. I struck one behind the fore shoulder; he did not go more than twenty yards before he fell and died. This was the cause of much exultation, because it fulfilled my determination; and, as we had been two days and nights without victuals, it was very acceptable. Found some scrub oak. In about one mile made a fire, and with much labor and pains got our meat to it, the wolves feasting on one half while we were carrying away the other. We were now provisioned, but were still in want of water, the snow being all melted. Finding my drought very excessive in the night, I went in search of water, and was much surprised, after having gone about a mile, to strike the Mississippi. Filled my hat and returned to my companions.

"November 4.—Repaired my moccasins, using a piece of elk's bone as an awl. We both went to the Mississippi and found we were a great distance from the camp. I left Miller to guard the meat, and marched for camp. Having strained my ankles in the swamps, they were extremely sore, and the strings of my moccasins cut them and made them swell considerably. Before I had gone far I discovered a herd of ten elk; approached within fifty yards and shot one through the body. He fell on the spot, but rose again and ran off. I pursued him at least five miles, expecting every minute to see him drop. I then gave him up. When I arrived at Clear River, a deer was standing on the other bank. I killed him on the spot, and while I was taking out the entrails another came up. I shot him also. This was my last ball, and then only could I kill! Left part of my clothes at this place to scare the wolves. Arrived at my camp at dusk, to the great joy of our men, who had been to our little garrison to inquire for me, and receiving no intelligence, had concluded we were killed by the Indians, having heard them fire on the opposite bank. The same night we saw fires on the opposite shore in the prairie; this was likewise seen in the fort, when all the men moved into the works."

It was now the middle of November, and the river was closing up. Pike was obliged to hunt practically all the time, and was impatient of the slavish life led by the hunter, and the necessity of working all the time to support his party. Under such conditions the pursuit of game becomes work, and not play.

After the winter had finally set in, Indians began to be seen; some of them Sioux, Yanktons, and Sissetons, as well as some Menominees.

A considerable part of the month of December was spent at various camps along the Mississippi River, below the mouth of the Crowwing River, and the time was devoted to killing game and making preparations for the northward journey. About the middle of the month Pike started with sleds, sometimes hauled by men across the prairies, and sometimes along the ice on the river, wherever it was heavy enough to bear the load. The way was hard, and sometimes but short trips could be made with the sleds. As there was little or no snow, the men

were obliged to double up, hauling a sled for a short distance, and then leaving it to go back and haul the next one along. One of the sleds broke through the ice, and everything it contained was wetted, including a considerable portion of the powder. Pike found his various duties laborious, for he was at once "hunter, spy, guide, commanding officer, etc."

In January he met a Mr. Grant, an English trader, by whom he was hospitably received and well treated. About the middle of the month, finding that his sleds were too heavy to be hauled through the snow, he manufactured toboggans, which would be more easily hauled, even if they carried smaller loads.

On the first of February he reached Lake La Sang Sue, now known as Leech Lake. This Pike believed to be the main source of the Mississippi. The lake crossed, he stopped at a trading post of the Northwest Fur Company, where his men arrived five days later. Here he hoisted the American flag in place of the English flag which he had found still flying; and after a few days went north to Upper Red Cedar Lake, which we now know as Cass Lake, Minnesota. This was a country passed over in 1798 by David Thompson, a great explorer, whose journeyings not long ago were edited, together with those of Alexander Henry, the younger, by Dr. Elliott Coues.

Pike was now in the country of the Chippewas, whom he knew by their other name, Sauteurs, and on July 16 held a council with them, notifying them that the country was no longer in the possession of the British, advising them to make peace with the Sioux, and asking some of their chiefs to go with him to St. Louis, where they should see General Wilkinson. His talk with the Indians was pleasantly received, and they made no difficulty about giving up their flags and medals, which were to be replaced by flags and medals of the Americans. Two well known young men of the Sauteurs, living hereabout, expressed their willingness to accompany the explorer to St. Louis, and a day or two later Pike struck out in a southerly and southeasterly direction, to return to his fort on the Mississippi. He reached that river about March 1, and found all his people well.

Pike was now prepared to start south as soon as the river broke up, and to report success in all directions; a success due entirely to his own astonishing energy and industry, for he alone had made the expedition what it was. Something of what he felt he expressed when he wrote:

"Ascended the mountain which borders the prairie. On the point of it I found a stone on which the Indians had sharpened their knives, and a war-club half finished. From this spot you may extend the eye over vast prairies with scarcely any interruption but clumps of trees, which at a distance appear like mountains, from two or three of which the smoke rising in the air denoted the habitation of the wandering savage, and too often marked them out as victims to their enemies, from whose cruelty I have had the pleasure in the course of the winter and through a wilderness of immense extent to relieve them, as peace has reigned through my mediation from the prairie Des Chiens to the lower Red River. If a subaltern with but twenty men at so great a distance from the seat of his Government could effect so important a change in the minds of these savages, what might not a great and independent power effect, if, instead of blowing up the flames of discord, they exerted their influence in the sacred cause of peace?"

He was frequently seeing Indians, and he was treated with great respect and hospitality by all of them. He was especially impressed by his neighbors, the Menominees, in whom he recognized many good qualities.

On the morning of April 7, 1806, the party started on the return journey, and made good time down the river, reaching the Falls of St. Anthony, where Minneapolis now stands, on the morning of April 10. Below here, on the following day, at the mouth of St. Peter's River, was found a camp of Sioux, including several bands, and Pike had a talk with them. The council-house was capable of containing 300 men, and there were forty chiefs present, and forty pipes set against the poles. At the council all these Sioux smoked the Chippewa pipes, excepting three, who were still mourning for their relations killed during the winter. Within the next two or three days he met important Sioux chiefs, Little Crow and Red Wing, who were extremely cordial, and emphatic in expressing their wish to carry out the instructions which Pike had given them.

From here down the river the journey was interrupted only by occasional talks with Indians, until Prairie Des Chiens was reached, where there were many white people, and Pike received the first news of the outside world he had had for many months. He saw here a great game of la crosse on the prairie between Sioux on one side and Winnebagoes and Foxes on the other. Councils were held here with various bands of Sioux, and with the Winnebagoes. On April 23 they once more started down the river, but were delayed by a head wind. Two days later Captain Many, of the U. S. Army, was met on his way up the river in search of some Osage prisoners among the Sacs and Foxes. At some of the Indian camps passed, all the people were drunk—sure sign of the proximity of the white men.

This practically completes Pike's voyage, for he reached St. Louis April 30, after an absence of eight months and twenty-two days. After this expedition followed the journey to the head of the Arkansas, and the subsequent passage through New and Old Mexico.

The Rocky Mountains Park.

ROCKY MOUNTAINS PARK OF CANADA, Banff.—*Editor Forest and Stream:* I send you a description of a very few of the many points of interest to be found in the National Park of Canada. To give a detailed description of the entire reservation would, I am sure, try your kind offer of space in the **FOREST AND STREAM**, for such a write-up would fill a very large book.

It was in 1886, during the construction of the Canadian Pacific Railway, that the Canadian National Park, a large reservation in the very heart of the Rocky Mountains, was chosen by the Dominion Government for its beauty, sublimity, and healthfulness, as the great breathing place of the nation.

At that time the area of the park was 260 square miles. The topographical survey of the Rocky Mountains was begun by the Department of the Interior in 1887, and continued until 1892. J. J. McArthur, D.L.S., and W. S. Drewery, D.L.S., were in charge. In the performance of their work these gentlemen, to use a Western expression, climbed more peaks than you could shake a stick at. Since then such well known explorers and mountaineers as Edward Whymper, A.C.; Dr. J. N. Collie, F.R.S., and Rev. Jas. Outram, as well as W. D. Wilcox, F.R.G.S., Professor Fay, A.M.C., and others from across the southern boundary have spent several years in exploring and climbing to the summits of our highest peaks.

Within the last few years the influx of mountaineers, artists, photographers, hunters, and general lovers of nature in its wildest forms, seemed to necessitate the enlargement of the original reservation. In the spring of 1902, therefore, a bill was introduced in the Dominion Parliament by the Hon. Clifford Sifton, Minister of the Interior, providing for its extension on a very large scale. The Dominion now has two parks at the backbone of the Rockies. They are the Rocky Mountains Park with Banff as its center, and the Yoho Park, with Field as its chief point. The two parks adjoin, and so for all practical purposes they constitute one park. The area of the Rocky Mountains Park now is 4,900 square miles, or 3,136,000 acres. Yoho is 832 square miles in extent; so the entire park area is 5,732 square miles, or 3,668,480 acres.

The addition to the Rocky Mountains Park is in the form of a huge right-angled triangle, with the backbone of the Rockies—the boundary line between the Northwest Territories and British Columbia—as its longest side; all the land is thus in the Territories. Yoho Park is in the railway belt on the British Columbia side of the mountains.

By the setting aside of the two park areas the Dominion has assumed control of the grandest accessible scenery in the whole Rocky Mountain area. Yet, though Banff has become a household word in Canada, the United States, and even in Britain, though every visitor to the park is enthralled by what he sees, though it is freely admitted that Switzerland takes a second place when compared with Canada's sea of mountains, there is, after all, very little known of Canada's great park. Every day new beauty spots are being revealed, and celebrated mountain climbers and topographers are constantly visiting and exploring this park. This is particularly the case with scientific men from Europe. There is no particular incentive for scientific men to go to Switzerland, a country that has been thoroughly explored, while in the Canadian park there are any number of mountains that have never been climbed, and valleys, gorges, and lakes that have never been visited. Every visitor carries a camera, and the many new scenes of grandeur that are revealed after each trip do much to spread the fame of Canada's great park.

Yoho Park Extension.

Yoho derives its name from the Indian expression indicative of great astonishment, and well is it named; what grander sight can be imagined than a volume of water 200 yards wide taking this mighty leap of over 1,400 feet. If the stoical Indian utters expressions of surprise and wonder when he enters the Yoho Valley, how much more does the white traveler. Shortly after entering the valley, there comes to the ears a noise like that of a sob, and further in the sobbing grows until there finally breaks to view the great Takakkaw Falls, almost ten times higher than Niagara, dropping over the face of the mountain. This mighty stream flows the year around, giving forth the strange pulsations and sobbing sounds, until every nerve in the body seems to wait to catch a new sensation. Newcomers stand spellbound and seem never to tire of watching this wonderful work of nature. Three distinct sobs are heard of different volume; one starts low and indistinct, the second is very apparent, and the third is so loud that it fairly takes your breath; then every few seconds this is repeated over and over again. The noise and roar usual in waterfalls is lacking here, for before the stream has completed its drop of 1,400 feet, the water has become clouds of spray and opaque in color, falling more like so much rain. Mr. Whymper, the celebrated mountain climber, declared that it is "Unparalleled by anything I have seen in the Alps, Himalayas, or the Andes."

Yoho is characterized by large waterfalls, great glaciers, huge peaks, and it has so much wonderful and beautiful scenery that it is eminently adapted for the purpose of a public park. The mountains in the Yoho are very largely peaks, while in the Rocky Mountains Park the general tendency is toward huge parallel ranges, though of course there are many fine peaks, too.

The Canadian Pacific Railway Company has such faith in the Yoho and its attractions, that last year they spent over \$100,000 there in the erection of hotels. During the past year about twenty-five miles of good driving roads have been built in this portion of the reservation, as well as many miles of bridle paths leading to various points of interest.

One purpose intended to be effected by the enlargement of the park area, is the protection of game. In its former size the park was too small to afford adequate protection; but the area is now so great that it is expected that all kinds of game will be found in it practically for all time to come. Already there are bear, moose, elk, antelope, red deer, mule deer, mountain sheep, mountain goats, wolves, coyotes, and minor fur-bearing animals, while in the many rivers and lakes there are grayling, mountain trout, salmon trout, rainbow trout, and other fish. The park area is now so large that even if there is a little

poaching on the outskirts, it will not appreciably affect the game in the park as a whole.

It has been the experience at the Yellowstone Park that wild animals in a protected area soon learn that they are safe there, and this of itself has a noticeable effect in the preservation of animal life. Protection for the fish is assured, inasmuch as the park contains the sources of many streams.

God's gifts are great and grand beyond all description, but there are other places in the park that appeal to many of the visitors even more than scenery, and one is the animal paddock, an inclosure of 1,000 acres. In 1898 Lord Strathcona donated his herd of sixteen buffalo to the Government, and in the mighty shadows of the huge mountains surrounding Banff this herd has increased to forty; during that time three only have died. Many good stories can be found here that would interest lovers of nature and animal lore. One story is of Strathcona, who for five years after their arrival in Banff was the recognized leader of the herd; at the present time he is thirty-one years of age, and a grander specimen of the buffalo bull could not be found. One day, however, a young Texas bull which had been imported, discovered that he was of age, and with a little encouragement from Strathcona they went about to contest the leadership. Strathcona at first thought Texas was bluffing, until he was rolled over, when, with anger and surprised wrath, Strathcona jumped to his feet and charged Texas, who met him half way with a vim that shook him to his tail. The fight lasted some hours, and so well did the young Texas sustain himself that old Strathcona came off second best with a broken horn. Since that time he seeks pastures new, and during the rutting season his loves are wooed apart, and out of sight of Texas, for there is danger, indeed, if he is ever sighted by the new leader. Another interesting feature of the paddock was the arrival of the first moose born in the inclosure. Its mother was hardly twenty-two months old when the baby arrived, but young as she was, she demonstrated her mother's love by chasing away several tourists who attempted animal sight-seeing on foot, and it was well for them the fence was so close, over which they climbed and escaped. In a cage wire-netted yard are several prairie wolves, commonly known as the coyote, and a large gray wolf. The latter is quite friendly, and will allow anyone to stroke and pet him, receiving the caresses with every token of pleasure.

The whole animal paddock has gone ahead in a wonderful manner; moose, elk, caribou, black and white-tail deer, mountain goat, coyote, fox, wolf, and birds indigenous to the Northwest, all add attraction to the tourist. Many of the animals are quite tame, even looking for a caress or kind word from the visitors. The small deer are very friendly, often following the carriages to the gate of the inclosure. All the animals have made additions to their numbers, so that the graceful fawn, the long-legged moose, the dumpy buffalo calf, and the shy kit fox are no unusual sight. The last census of the park paddock numbered eighty-one all told, and already new grounds are being picked out for fresh paddocks.

Possibly winter is even a better time to see the animals than is the summer, for then the entire lot can be seen clustered around the racks and stacks of sweet mountain hay, for it is necessary to feed these pets with care if success with them is to be had. Some even get grain and vegetables, according to their condition and age. It is a pretty sight to see a long line of animals feeding side by side out of the same rack, where, if they were in their native home, it would be a case of fight and kill, for nature knows no peaceful laws such as those which govern this domain. This wonderful feeling of protection and security against their common enemy has been so bred in these animals that it seems to have gone forth into the surrounding country, for already large bands of deer are often seen within sight of the villages throughout the park. Even the wily mountain sheep, or so-called bighorn, stands in all his beauty looking down on this new found animal world with wonder and surprise. Several times sheep have even gone so far as to leave their mountain pastures—one of these mountains forming one of the boundaries of the paddock, acting as a fence—and enter the paddock to graze with their domesticated friends. There they get the love word that all animal life is sacred here in the bounds of this great park, and this news travels in its own way over mountains and glaciers, rivers and valleys, until now within the 5,000 square miles the mountain goat and sheep will no longer run with fear, while the small deer, elk, and moose travel in pairs or droves, secure from the hunter, and the bears of four colors can be kodaked to the traveler's pleasure. Even a mountain lion one day last summer wandered into the park within a mile of Banff. No doubt it was a mistake, for when a carriage load of tourists passed him on the road, he looked much surprised, and even followed the carriage some distance to get another view of so strange a creature as the carriage and pair appeared to him.

It has been the policy of the Government to let nature alone as much as possible in the park. We do not attempt to build level roads, and we have never cut a bush or tree that we could avoid cutting. The visitor finds this great park just as it was left to us by the great forces of nature that piled up these massive mountains and made openings through them for the streams. That the tourists of the world appreciate Banff is evidenced by the fact that during the last twelve months more than eleven thousand of them have visited it. Thus far has this resting place developed, where nature, man and God draw closely together, and the coming years promise yet greater things than these.

HOWARD DOUGLAS,
Superintendent.

A FARMER at North Bransford, Ct., had been missing many eggs from his hen-house of late, and was at a loss to account for the trouble. Sunday he took a day off and watched the hen-coop. Late in the afternoon he heard the hens making a great row, and rushed into the coop in time to see a big five-foot black snake crawling under the floor. He made a dash for it, captured it, and killed it. He noticed that there was something in the snake's mouth, and stepped on its head, squeezing out a china nest egg which the snake had stolen, mistaking it for a hen's egg.—Springfield Republican.

A Summer in Newfoundland.—VII.

(Continued from page 87.)

THAT night all precautionary measures were disregarded, for we made a roaring fire of birch logs, which lighted the woods in a great blaze. Slowly roasting on a skiver of green wood hung a huge steak, while high up on a scaffold long strips of venison were drying in the smoke for future use; antlers, skull and scalp, all carefully cleaned and salted, were stowed well in under a waterproof canvas. The former, although not well pointed, were large and very massive, indicating the probability of great age in their recent possessor. The fat sputtered, the fire crackled, and William, happy in the consciousness of a rapidly returning reputation as a hunter, related tales of fisherman's life along the coast, of the herring and cod banks, and of the "swiles" off the Labrador ice floes. He is one of those rare natural story tellers which the traveler so often finds hidden away among untutored peoples, and his accounts are vividly and his scenes graphically pictured by the most eloquent gestures. He reminds me of old John Stroud, sage and philosopher of Alexander Bay, the man who many years ago traveled alone from Gambo to Bay of Islands with an important Government message. "Uncle John" is the best story teller in Newfoundland, and I never shall forget the night when I met him on the hills north of Island Pond in the Terra Nova country. He was sitting by the fire sewing up a pair of "shanks," and related story after story to a group of attentive sportsmen and admiring packers. Here is one of his tales, told in a way peculiar to himself, but any attempt on my part to do it full justice—any attempt to depict his simple humor and unique grammatical constructions—would prove a failure. This is no idle story, either; and should a certain gray-haired sportsman in a certain great city far to the southward of Newfoundland, happen to read these pages, perchance he will open his eyes and enjoy a quiet laugh all by himself.

"About five year gone, I t'ink it wuz, dat a sporter come from N—t' Newfoundland. 'E travels across de country on de train, comes t' Alexander Bay, stops, gets outen de train, an' walks over t' de village up t' a little 'ouse, an' asks fur a cross ole guide called John Stroud—an' dat wuz meself. He wuz de — of — Arms Company, but de unhandiest shot wid a gun dat ever I guided on de country. We closed t'ree big stags right 'andy, an' he wuz nigh enough onto four or five more, but I don't t'ink dat gentleman ever shot inside two rod o' de mark; no, I don't t'ink it. Well, a fortnight wuz gone an' I wuz a feelin' mighty oneasy.

"You knows right well, sir, de White Hill Plains, up t' de nor'ard, an' you knows de big barren by de east'n end. Well, in dat barren be a little pond, an' roun' de edge of de little pond be a wet ma'sh, an' in de center of dat wet ma'sh muz somet'ing. What wuz it, sonny?" (addressed to Frank Sayre, who accompanied me). "Why, bye, a company o' deer. On de right wuz de 'tan hoods, on de left wuz a bunch o' tucks, an' in de middle behind a far tree wuz we. Un ole stag an' six does an' two fawns wuz in de company, an' it wuz de last day o' September, as I remember. Well, we closed dem up t' eighty yards, an' den says I to de ole gentleman, 'You be 'andy enough, sir,' but de t'irty-t'irty wuz a shakin' in his 'an's, an' 'is teet' a chatterin'. 'Now, sir,' says I, 'you take de ole stag an' I'll kill dat fat doe fur camp meat, an' we'll bote fire togedder.'

"Well, down goes de stag, shot in de lights, an' up jumps de ole man jest like he been un o' dem Husquimaux. 'E dances roun' an' roun', an' shakes 'an's right ways an' den crossways fur luck, an' 'e pulls ten dollars outen 'is pocket an' 'ands it over to me; an' me, I jest grins an' keeps quiet."

"But did ye miss de doe, John?" queried 'Lige Sweet-apple from across the fire.

"You never mind 'bout de doe. I never aimed at 'er, 'Lige," and a broad, significant smile spread over the old man's features.

Sand Pond is literally filled with small trout, the veritable speckled fontinalis, and so are many of the larger lakes in Newfoundland. In September every cold brook which feeds its waters contains hundreds of them lying in ranks and files like soldiers, heads up stream, on their way to the clear springs of the spawning grounds. At sundown, dozens of the little fellows, not more than eight or nine inches long, play and frolic in the shallow water of the outlet. There must be some deep, dark holes where big fish lurk, for a trout attains his greatest size and perfection not in a swiftly running brook, but hidden in the placid depths of a lake—just such a lake as ours.

So I builded a little raft of spruce logs, bound it togedder securely with long fibrous roots, hacked out a rough paddle with the ax, and pushed off from shore. The inlet or outlet were of course the most likely places, and they were tried first. But small trout bothered me somewhat, two or three often rising together to a single fly. How truly incongruous it seems—bothered by trout! Big fellows were there somewhere, down near the bottom, but wholly indifferent to all my efforts. The old conservative theory that a dull fly should be used on a bright day, failed as completely as did the more modern rule which dictates that a brilliant fly on a sunny day gives less contrast and is the more successful. They had no appetites whatever, either for the gaudy feathers of a Parmachenee-belle or the sombre colors of a black-gnat. Then I tried another method—one usually deadlier than any—and drifted up and down through the outlet with a fat grub baited on a plain bare hook, allowing the latter as free access to the nooks and crannies of the bottom as previously I had thrashed every foot of the surface with my flies. Strikes were plentiful, it is true, but such strikes—mere nibblings at the poor grub by fingerling fish; or in case a lively half-pounder happened along, he seized the bait with a tug worthy of a salmon, and then rising to the surface, proved himself only a little fellow, after all.

No angler ever lived who was not hopeful, philosophic, and thoroughly persevering. I had tried the two best methods known to the piscatorial art with utter failure, but there was still another in reserve, and I paddled back to camp, still expectant, and with a firm resolve to try it again on the morrow.

Two years ago when in Québec, on the far-famed waters of Lake Edward, I learned that many of the heaviest trout are killed on a small spoon. This, of

course, as a general practice is totally repugnant to the ethics of sportsmanship, but the method is often tried merely for the purpose of locating the retreats of the fish. The same may be said of the ouananiche fishing in Lake St. John. During August they will strike at a spoon or spinner even more readily than at a fly, and it is to be regretted that many record catches are made by means of the former death-dealing device. The fish average small at Lake St. John, two and three-pounders as a rule, and their mouths are correspondingly smaller; but how can any fish do himself full justice as a fighter with a gang of hooks widely distending his open jaws? The same may be said of the maskinongé fishing in many parts of the St. Lawrence and throughout the Kawartha Lake system of lower Ontario. Here the use of a good sized spoon is almost universal, and there is no doubt that as compared with a single hook, the former seriously handicaps a fish of medium size, and mars the sport considerably. Maskinongé may not be as aristocratic as salmon or brook trout, but they are grand fish none the less, and if given a fair chance on light tackle, one of them will take good care of himself, and perchance surprise not unpleasantly the fly-fisherman, with all his conservatism and candor.

If the shade of Izaak Walton himself should suddenly appear at one of our summer fishing resorts, what a surprise would await it: For "Piscator" would see things unrecorded in the pages of that "little treatise on fish and fishing with an angle" written so many years ago. Perhaps he would open his eyes in astonishment at the methods employed, and perchance he would enjoy a quiet laugh, all by himself, at the expense of the fisherman of to-day. For truly, and sad it is; the art of angling has kept well abreast of the times. It has grown and expanded in this life of highly organized industrialism of ours, and consequently has lost much of its old-time quaintness and conservatism. In some localities it can hardly be termed an art at all, but has been reduced by skillful modern inventions to the almost mathematical precision of an exact science.

Just glance for a moment at some of the men who start out from Alexandria Bay for pickerel and bass—or better still, at the one who tries his luck with lake trout on the Charleston or Red Horse waters. Make a good inventory of his equipment, let him explain its use, and you will wonder why any fish are left in the water to bite. The sportsman is sitting contentedly in the stern of a St. Lawrence skiff; beneath him a well padded cushion, behind him a chair-back, while a pair of strong guide's arms do the work. The latter knows all shoals, weed beds, and padded coves in the pond, as well as the sunken logs where big "oswegoes" hide, and "the very best trout grounds in that region." This he knows well. But even should subsequent events prove to the contrary, that innocent waiter in the stern, the man from the city, never learns the difference, and hopes expectantly for a strike. Towards evening that strike comes; not a very hard one, to be sure, but enough; for a double gang of needless hooks were never known to tear out, and surely that end of the tackle at least is safe. The rod bends, but never breaks; no danger there, for that rod is made of well tempered steel, and guaranteed to hold anything that swims. But the fish is heavy, he pulls hard, he is a big ro-pound laker, and is the line safe? Oh, yes; that line is the strongest on the market, for it is made of braided copper wire warranted to hold a dead strain of fifty pounds. Watch closely, now, and you will see that the man in the stern calmly holds his rod in one hand waiting for the end, and that he never once touches the crank of the reel. But what is the use? His reel has no crank, it winds up like a clock; an automatic reel, where "the little finger does it all"—no chance left for the poor fisherman! The trout is surely weakening, and now, completely tired out, it is wound in ready for the landing net. The guide stoops down and picks up from under the bow a very peculiar device—all levers and springs. He gently taps the fish with it, and immediately two steel prongs transfix the latter and a moment later it struggles safely in the bottom of the boat. That is the "no escape" gaff. This is an age of invention, 'tis true, but has modern science yet produced improvements more varied and unique than we see in the evolution or degeneration of fishing tackle?

In my outfit was a small star spoon, sharp of hook, brilliant of feather. With this attached to a nine-foot leader and a split buckshot nipping the latter some three feet from the end, I trolled slowly around the shores of the pond. Likely looking coves, sharp, rocky reefs, and deep holes, were all carefully explored, while special attention was bestowed upon the places where brooks emptied their icy streams into the warmer waters below. It was hard paddling on that raft, and wet for the feet as well, but the breeze was light and I could feel the spoon throbbing and tugging, free of weeds as it whirled and twisted through the water. For two hours I trolled without a strike, almost completing a circuit of the pond. Gloom had commenced to settle over the water, and the chance for a good supper looked slim enough. But just at the entrance to the outlet, not ten rods from camp, I struck a fish, and, after a brief struggle, landed him, struggling, in the net. How often it happens that we travel far away diligently searching for happiness or success, and then turn back home without it, only to find it waiting on our very door-steps. Here was the very spot where big fellows were lurking, right by the tent. So I selected a small scarlet-ibis for dropper, intermediate a royal-coachman, and as tail fly a large white-miller. At the third or fourth cast a two-pound fish rose prettily to the tail fly, and a few moments later another of perhaps 2½ pounds in weight struck the miller again below the surface. Both fish were safely landed, and with them a third of the same size was lying on the boughs which covered my raft. They were all very dark in color, much more so than any of the small fry seen jumping in the shallower water. In fact, they were the deepest colored fish that I have ever seen in such clear water, quite in contrast to the delicate flesh pink so frequent in the Long Island variety, or the brilliant silver of the sea trout. Noticing their undoubted preference for a white fly, I hastily changed my cast; and now with an ibis as intermediate and two small white-millers as tail fly and dropper respectively, I tried for another rise. Soon it came, and his broad tail splashed the water as seizing this time the ibis, he surged off in a great arc toward shore, and then tore off. It was too dark to see plainly, but my little

finger told me that I had hooked and lost a heavy fish. Why is it that in fishing the largest and finest in the pond is the one which always escapes? After it is all over, your mildly insinuating friends merely shake their heads and smile sadly as you relate the story in all its pathetic details. But truly, is it not perfectly rational and reasonable—strictly in accordance with the theory of natural selection and the survival of the fittest—that the strongest remain free to perpetuate their race? What pleasure would there be in angling if anglers were not searchers at the same time; always persistently seeking a larger record, a few more inches, another ounce, a new and better story to relate around the evening camp-fire.

That fish certainly weighed five pounds, and who knows but perhaps he might have tipped the scales at eight? But, after all, the lost big fish—the one that gets away—is the very fish which lends the charm to angling. I reeled in my line, for it was dark, unlooped the flies, and behold, the barb of the little ibis was gone.

The nomenclature of Newfoundland inland waters is simple, indeed, and easily understood. Their names imply neither subtle distinctions in their derivations or vivid imaginations for their conceptions. They are names almost harshly practical in their significance, and strangely lacking both in poetic fancy or idealic sentimentality. Where are the Spirit and Echo and Placid Lakes, the Mirror Ponds and Roaring Brooks, written so often on the pages of our State maps? Beautiful in their conception, it is true, but often either quite inappropriate or totally lacking in any historical significance. Every brook roars during freshet time, and each pond in the woods is placid or mirror-like according to the caprices of the winds. A hurricane creates many Devil's Lakes; a high cliff christens hundreds of Echo Ponds; while during the quiet hush of the midnight hour, every lake in the world is a Spirit Lake.

But in Newfoundland the name of each body of water has a true story of its own to tell. Thus we learn with interest the harrowing tale of Dead Man's Pond, or the story of Stag or Wolf, White Bear or Hungry Grove Lakes. Sandy Lakes are common; so are Burnt or Island Ponds, while Bear Brooks are frequent throughout the interior. Red Indian Lake has its history written in letters of blood, and the tragic romance of Squaw Pond is a sad tradition of the ancient Beothiks—those strange, mysterious people who have vanished.

Some eight miles from camp was situated a little sheet of water completely surrounded by thick spruce forest. It was not very much to look at, to be sure, but to Jim it seemed the finest lake in Newfoundland; for it was there, back in the early seventies, that he had trapped a single black fox with a pelt worth a fortune of \$90 at St. Johns. That occasion was one of the crowning events of the old man's life, and no wonder that the spot was still cherished in his memory under the appropriate title of Fox Pond.

Early one morning we sat watching on the shore of Fox Pond. Up at the other end a three-year-old stag was busily engaged trampling the bushes as he proudly rubbed a pair of insignificant antlers among the alders. Over in the shallow water a fine adult otter was catching a breakfast of trout; and it was his glossy black pelt and the prospect of securing it that particularly interested me. He was about three hundred yards away, but his every motion was observed through the glass as we lay hidden behind a clump of bushes. A small moving object three hundred yards away makes a very uncertain mark for anyone who is not an expert with the rifle, and I wisely decided to watch and wait, hoping that the otter might decide to take a little excursion in our direction. Jim asked permission to "tole 'im up 'andier," but I had little faith in "tolling" or "bawling," as it is sometimes called in Newfoundland, for only a few days before the guide had tried it on a stag, with a result that the latter quickly departed in the opposite direction for parts unknown. Whether the otter was fishing or merely enjoying a morning frolic, I could not determine, even by the aid of a glass, for he kept plunging above the surface porpoise-like, often remaining below for two or three minutes. So I finally told my companion to go ahead and venture a "tole" or so for luck; and he replied by uttering a low coughing bark in his throat, something between a grunt and a blat. Never have I witnessed a more successful attempt to decoy an animal. The effect of that single "tole" on the otter was magical, for immediately changing his course, he headed down the pond in our direction, leaving a broad wake of ripples behind.

WM. ARTHUR BABSON.

In Camp at Flathead Lake.

THE Sixth Annual Session of the University of Montana Biological Station has just opened at Flathead Lake. This station, which is under the direction of Prof. Morton J. Elrod, has already made a name for itself by its work here, and will this year continue to provide opportunity for investigation of the biology of the lake and mountain region, and for instruction in botany, zoology, entomology, nature study, and photography. The work proposed to be done is broad, and the instruction is adapted to students of the University and of high schools, to teachers in schools, as well as to beginners in natural history and investigators of experience. The location is a very beautiful one, and the equipment quite complete, for most of the implements needed for the work—including books—can be had on the ground, being supplied by the University. Those who require guns or field glasses or cameras or plates must bring them.

Rare opportunities for investigation and study exist in this beautiful region. The waters of the lake and the near-by rivers abound in life; near at hand are high mountains covered with forests, and reaching up nearly or quite to the snow line. Excursions of great interest may be made, and among those promised for the season of 1904 are a trip to Swan Lake, spending the night at the lake; a trip to Rost Lake at the base of the Kootenay Mountain; an ascent of McDougall peak to an altitude of 7,725 feet, and a trip around Flathead Lake.

The post-office address of the station is Big Fork, Mont., and it may be reached by the Great Northern Railroad at Kalispell, or by the Northern Pacific at Selish. Stages from these points connect with steamers on the lake.

A sojourn, long or short, at this station offers very great attractions, and as the region is so easy of access,

we cannot doubt that it will be visited this year and in succeeding years by many people, not only from Montana, but from more distant points.

Here is an abstract of a capital bit of outdoor gospel preached by the Bulletin of the University of Montana, which is worth laying to heart in Montana as elsewhere. It has a special reference to this Biological Station:

"Change is rest. To take a day off and go a-fishing often gives new lease of life. The tingle of the nerves when the gamy fish tugs at the line causes us to forget care and to be thoroughly alive. One of the attractions of the place is its natural advantages so as to induce outdoor exercise and study. The lake and rivers make rowing a good pastime. The photographer has a field of wondrous richness and varied interest. A fine sand beach makes bathing a delight, and it is indulged in. Unless the lake is stirred by winds, the water is warm. The hills and forests afford quiet retreats for study or strolls. The hills and roads give glimpses of scenery of rare beauty. At the proper season hunting is good. Deer are seen each year a few rods from the laboratory. Grouse and pheasants abound in the hills. In season duck shooting is fine. A day's tramp will take one to the home of the Rocky Mountain goat. In a day one may penetrate a pathless forest or stand on craggy heights, where the view presents the jagged Rockies, the back bone of the continent."

Natural History.

Do Birds Smell?

Editor Forest and Stream:

A few observations in reply to my friend Charles Cristadoro, on the prolific subject of the smelling faculty of ducks. There seems to be no room to doubt that bears, and all other quadrupeds among the *fera natura*, have very keen olfactorys, upon which most of them depend mainly for security from the attacks of their enemies. But as to ducks; and in fact all other feathered bipeds, that is another question.

The instances cited by Mr. Cristadoro, and others, that a certain class of hunters set out their decoys with reference to the direction of the wind, having in view the supposed smelling powers of the ducks, proves no more than does the custom of negroes and other ignorant fishermen, of spitting on the hook, or perfuming it by an application of asafetida, with the idea that fish are thereby attracted. Such testimony but emphasizes the fact that the numerous fallacies concerning the affairs of everyday life that have survived from a very remote period in the history of the human race, still enthrall the human mind of to-day in large measure, and exert a powerful influence in human affairs. Such fallacies are not confined to the mental habit of the very ignorant neither, as witness the general prejudice among all classes, against the number 13, and against Friday among the days of the week, along with a further long list of vain imaginings among the children of men, showing the amazing tenacity of the sentimental impressions implanted in the human mind in the infant period of race history, which still hold their place in defiance alike of reason and experience.

But, to get back to ducks. There appears to be but little direct testimony of a scientific character, upon the question of the smelling faculty, or the lack of it, among the feathered class with beaks or bills. It may, however, be of interest to note what John James Audubon says on the subject. In describing the turkey buzzard, he says: "The olfactory nerve has been ascertained in the mammalia to be the instrument of smell; but, in the class of birds, experiments and observations are wanting to determine its precise function, although analogy would lead us to suppose it to be the same in them. So inaccurate have observers been in this matter, that some of them have mistaken the large branch of the fifth pair, which traverses the nasal cavity, for the olfactory nerve. The experiments instituted upon vultures show that not only are they not led to their prey by the sense of smell, but also that they are not made sensible by it of the presence of food when in their immediate proximity. Yet if the olfactory nerve be really the nerve of smell, and if a large expansion of the nasal membrane be indicative of an extension of the faculty, one would necessarily infer that vultures must possess it in a high degree. On the other hand, however, the organ and the nerve being found to be equally developed in birds such as geese and gallinaceous species, which have never been suspected of being guided by smell when searching for food, it would seem to follow that the precise function of this nerve and the nasal cavities has not yet been determined in birds. That the nasal passages must be subservient to some other purpose than that of respiration merely, is evident from their complexity, but what that purpose is remains to be determined by accurate observations and experiments."

Might not this be a simple case of organs once active in this class of the animal kingdom that have become atrophied by lack of exercise?

Audubon further quotes his friend Townsend in relation to the California vulture, as follows: "The California vulture inhabits the region of the Columbia River to the distance of 500 miles from its mouth, and is most abundant in spring, at which season it feeds on the dead salmon that are thrown upon the shore in great numbers. It is also often met with near the Indian villages, being attracted by the offal of the fish thrown around the habitations. It associates with *Cathartes aura*, but is easily distinguished from that species in flight, both by its greater size and the more abrupt curvature of its wing. The Indians, whose observations may generally be depended upon, say that it ascertains the presence of food solely by the power of vision, thus corroborating your own remarks on the vulture tribe generally. On the upper waters of the Columbia the fish, intended for winter store, are usually deposited in huts made of the branches of trees interlaced. I have frequently seen the ravens attempt to effect a lodgment in these deposits, but have never known the

vulture to be engaged in this way, although these birds were numerous in the immediate vicinity."

If any species of birds do possess the sense of smell, suggestion points more forcefully to the carrion feeders than any other, as having special need of this faculty. But the testimony of scientific observers is directly to the contrary of such assumption.

Of all the birds we are familiar with, none are suspected of exercising smelling powers save only the wild ducks; and some of your commentators even attempt to differentiate between them, restricting the smelling faculty to some one species, which carries a strong suggestion of the same kind of imaginative fallacy as that which sends all the jay birds to the infernal regions every Friday.

Certainly no hunter ever takes account of smelling powers in the wild turkey, that wariest of all birds, nor indeed of any other among the numerous category of game birds, save only this very exceptional ascriptive of such power to certain of the duck species which, as before remarked, savors much of human fallacy.

COAHOMA.

Hummingbirds.

ST. AUGUSTINE, July 20.—*Editor Forest and Stream:* When you appeared in our old city a few weeks ago, you seemed to be interested in the result of some experiments I was trying with a pair of old hummingbirds which refused to be tamed. When the old birds appear in the spring I ignore them, and they leave; but last spring I unwittingly fed them, and finding such accommodating quarters they refused to leave, the result being that when the young birds (which are easily tamed) appear the old tyrants drive them off.

The old birds that I was feeding at the time of your visit I paid no attention to further than to refill the bottle with sugar water (not honey); but a few days after that they were feeding from my hand. But that is about as far as I can get with old birds. When I get them familiar enough, I carry a very small bottle in my pocket, and I only consider them tame when they'll come to me anywhere. To thoroughly tame them an early training is necessary.

A few years after my first appearance in this breathing world I was attacked by the all-absorbing hummingbird craze, and it has never left me since; with the natural result that what is known about them I know, and what I don't know about them others do—or think they do.

There is probably no member of the feathered tribe, from the dodo to the goose, that has been so thoroughly written up as the hummingbird, and probably not one that has been honored by so much nonsense. Ornithologists have left no stone unturned in pursuit of knowledge pertaining to them.

An enthusiast set himself at work to settle the one disputed question as to whether ruby-throat is, or is not, a devoted husband, in which case the verdict was against him; but I believe the point is not considered settled yet, though this man had a nest watched during every hour of daylight from the time of incubation till the young left the nest.

If I had collected all the articles I have met with during a few years past that were intended for the enlightening of the public on the hummingbird question, I could make up a goodly sized volume, many parts of which for absurd incongruities would rival Artemus Ward. The old idea that hummingbirds live exclusively on flower sweets is usually taken as their text, but I have scarcely ever seen an atom that was new.

The insect question has been settled years ago. It is a prime absurdity to suppose that they go to flowers for insects, for they can get them anywhere; but they *must* go to flowers for their principal food. I have been acquainted with many ornithologists—Gould among the number—and I have fed and tamed hummingbirds for more than fifty years, so I think myself capable of speaking with authority as to a hummingbird's bill of fare. I keep a "free lunch" for them all the time, and have to refill the bottle twice a day.

To entice them to the bottle, of course, a flower is needed at first, but they can soon be trained to dispense with that. The little gluttons will eat almost their weight in sugar water in a day, and it's quite an important business to keep a bottle filled for three or four of them. But I don't attend to the insect part of their bill of fare.

I am somewhat puzzled as to why so many people are so anxious to enlighten the world about things of which they are totally ignorant, but I can understand an ambitious young lady who is anxious to see herself in print taking up a fairy-like subject which she supposes involves some mystery. Then I can imagine her getting lost and appealing to her imagination to help her out by supplying a lot of inconceivable nonsense—as has been the case with several articles that I have seen.

DRYMUS.

Pasha's Home Coming.

PITTSBURG, Pa.—We had Pasha, an Arabian stallion, with which I had succeeded in escaping from Sedan after being taken prisoner in the battle of 1870, for a couple of years, when my father set out to spend a few days with his brother in the hill country beyond Oudenaarde, on the right bank of the river Scheldt. Father was very fond of Pasha, and prided himself on his horsemanship, and the two together made a beautiful picture. Every spring father got homesick for his native hills, and would go and spend a few days in the place where he was born and raised, and where his people had lived for generations. One beautiful May morning he started, his destination being a little over thirty miles, crossing the Scheldt at the walled town of Oudenaarde. The following morning, when I went in the orchard, what was my astonishment to see Pasha, without saddle or bridle, coming toward me, and rubbing his nose against my face. An hour later we received a telegram from father asking if we had seen anything of Pasha. I wired back he was home, safe and sound.

That was the last we heard of it until father came home in his brother's buggy, with Pasha's saddle and bridle stowed inside. The old gentleman was somewhat mortified, and at first eluded all inquiries about what had happened, but after a while he could resist mother's teasing no longer, and here is his story:

"The trip was pleasant and uneventful, and I arrived at brother's toward 5 P. M. The weather being warm, I put the horse in the orchard, where there is a shed, and he could lie down if he wanted. In the morning he was gone, and had leaped the live hedge several feet high."

He could not have crossed the bridge at Oudenaarde, for the gates of the town are shut at night. Pasha must have swam the river Scheldt, very deep and rapid there, and made his way home on the back track that night.

Mother told him it served him right; he had no business to take the horse away from home for so long a time, and the old gentleman replied, in his philosophical, quiet way, he could not blame him for liking me better than himself, as I had brought him to a good home. After that he took good care to tie Pasha, or shut him in a stable, when out on his trips in the country. Mother, who was strongly attached to Pasha, and I had many a quiet laugh over the occurrence afterwards, but father did not like to be reminded of it.

JULIUS THE FOX HUNTER.

Whippoorwill and Night-Hawk.

OLEONA, Pa.—*Editor Forest and Stream:* My reasons for believing that the night-hawk and the whippoorwill are one species are as follows: The first seventeen years of my life were spent on the summit of the Alleghenies in northern Pennsylvania, where I saw thousands of night-hawks, but never heard the notes of a whippoorwill.

Later in life, while engaged in lumbering operations along the river bottoms, I saw an equal number of night-hawks, listened to their one-note cry while in flight, and at the same time heard whippoorwill calls all about me.

The movements, habits, and markings of the bird mentioned in my last article were so precisely like Nuttall's description of the night-hawk that I can not believe that the two are of different species.

I have a theory that the whippoorwill, on high ground, is songless. Perhaps this, or something as yet unobserved by the naturalists, is responsible for the belief in two species.

From the one observation before mentioned, I am positive that the whippoorwill haunts the upper air and frequently plunges perpendicularly toward the earth, the

plunge being accompanied by a whizzing of wings precisely like that attributed to the night-hawk.

E. D. L.

[We suggest that our correspondent procure specimens of night-hawk and whippoorwill for comparison. An examination of the two birds in the hand will tell him the story far more convincingly than any description in words.]

Crows and an Owl.

BROOKLYN, N. Y., July 25.—*Editor Forest and Stream:* Perhaps some reader can explain to me the following performance: Last fall while hunting birds in the northern part of the State, I came out from a swamp into the open field and noticed a great number of crows (I counted over five hundred) flying over the field, all cawing at the top of their voice. Apparently they had some object at which all this commotion was directed. Being interested, I watched them till they reached a neighboring grove. Walking over in that direction I managed, with great care, to work my way very near to them. They had evidently rooted out from his morning sleep an owl, and now he sat upon a limb, looking rather sleepy, nevertheless, while this army of crows circled around him cawing and making a peculiar clicking noise. None, however, approached nearer than a yard or two of the old fellow. I watched them till the owl flew away, followed on all sides by the crows. Now, what I would like to know is, what is all this tomfoolery about, and how can they afford to waste the early morning hours so idly busy?

F. H. C.

[It is well known that most birds, but especially jays and crows, when they discover an owl in daylight, attack it, or at least venture as near as they dare, and by their cries and complaints make the owl uncomfortable, and call all the birds in the neighborhood to the spot to join in the tumult. The habit is so well known that formerly persons wishing to kill crows were accustomed to attract them by putting up a stuffed owl as a decoy.

The following lines from Nuttall's "Manual of Ornithology" (1832) refer to the little screech owl, other-

wise known as the mottled or red owl: "When perceived by the smaller birds, they are at once recognized as their insidious enemies; and the rareness of their appearance before the usual roosting time of other birds augments the suspicion they entertain of the feline hunters. From complaints and cries of alarm the Thrush sometimes threatens blows; and though evening has perhaps set in, the smaller birds and cackling Robins reecho their shrill chirpings and complaints throughout an extensive wood until the nocturnal monster has to seek safety in distant flight."

Frog Provender.

PRINCE'S BAY, N. Y.—When I was a boy eight or nine years old, I was detailed by my mother one day to watch the old hen with her brood of little chicks. From twelve they had in a few days dwindled down to four, and as careful as my mother could be, she could not find out what took them. There was a spring loosely stoned up in the meadow a short distance from the house, and from the spring there was formed a little pool at the edge of some alders close by. I had a tame trout in the spring, and I wanted to go and feed it, but mother said, "No, you watch that hen and chickens and don't let me hear aly more about trout to-day." Pretty soon my chance came. The old hen was making her way down toward the spring, and I was loitering along behind. I stood not more than twenty feet away, watching the hen drink, and then the chickens ran up and took a drink from the pool. All at once the old hen showed fight, and I thought that I had found the enemy, and gathered a few stones for the cat; but no, instead of the cat I saw a monstrous bullfrog, and he gulped one of those chickens down before I realized what was going on. I drove the hen and remaining chickens back to the house and told the folks what had happened, but they did not believe it until the frog was captured and cut open.

The foregoing was told to me by my father, who is now nearly eighty years of age. The incident took place at the foot of Mt. Tom, in the limits of the now prosperous city of Holyoke, Mass. So it seems that nearly three score and ten years ago frogs were cause for comment on what they picked out for provender. ***

Kentucky Sports.

From Audubon's "Ornithological Biographies," 1831-39.

It may not be amiss, kind reader, before I attempt to give you some idea of the pleasures experienced by the sportsmen of Kentucky, to introduce the subject with a slight description of the State.

Kentucky was formerly attached to Virginia, but in those days the Indians looked upon that portion of the western wilds as their own, and abandoned the district only when forced to do so, moving with disconsolate hearts further into the recesses of the unexplored forests. Doubtless the richness of the soil, and the beauty of its borders, situated as they are along one of the most beautiful rivers in the world, contributed as much to attract the Old Virginians as the desire, so generally experienced in America, of spreading over the uncultivated tracts, and bringing into cultivation lands that have for unknown ages teemed with the wild luxuriance of untamed nature. The conquest of Kentucky was not performed without many difficulties. The warfare that long existed between the intruders and the redskins was sanguinary and protracted; but the former at length made good their footing, and the latter drew off their shattered bands, dismayed by the mental superiority and indomitable courage of the white men.

This region was probably discovered by a daring hunter, the renowned Daniel Boone. The richness of its soil, its magnificent forests, its numberless navigable streams, its salt springs and licks, its salt-petre caves, its coal strata, and the vast herds of buffaloes and deer that browsed on its hills and amid its charming valleys, afforded ample inducements to the new settler, who pushed forward with a spirit far above that of the most undaunted tribes which for ages had been the sole possessors of the soil.

The Virginians thronged toward the Ohio. An ax, a couple of horses, and a heavy rifle, with store of ammunition, were all that were considered necessary for the equipment of the man, who, with his family, removed to the new State, assured that in that land of exuberant fertility he could not fail to provide amply for all his wants. To have witnessed the industry and perseverance of these emigrants must at once have proved the vigor of their minds. Regardless of the fatigue attending every movement which they made, they pushed through an unexplored region of dark and tangled forests, guiding themselves by the sun alone, and reposing at night on the bare ground. Numberless streams they had to cross on rafts, with their wives and children, their cattle and their luggage, often drifting to considerable distances before they could effect a landing on the opposite shores. Their cattle would often stray amid the rice pasturage of these shores, and occasion a delay of several

days. To these troubles add the constantly impending danger of being murdered while asleep in their encampments by the prowling and ruthless Indians, while they had before them a distance of hundreds of miles to be traversed before they could reach certain places of rendezvous called Stations. To encounter difficulties like these must have required energies of no ordinary kind; and the reward which these veteran settlers enjoy was doubtless well merited.

Some removed from the Atlantic shores to those of the Ohio in more comfort and security. They had their wagons, their negroes, and their families. Their way was cut through the woods by their own axmen the day before their advance, and when night overtook them the hunters attached to the party came to the place pitched upon for encamping, loaded with the dainties of which the forest yielded an abundant supply, the blazing light of a huge fire guiding their steps as they approached, and the sounds of merriment that saluted their ears assuring them that all was well. The flesh of the buffalo, the bear, and the deer, soon hung, in large and delicious steaks, in front of the embers; the cakes, already prepared, were deposited in their proper places, and under the rich dripings of the juicy roasts were quickly baked. The wagons contained the bedding, and while the horses which had drawn them were turned loose to feed on the luxuriant undergrowth of the woods—some perhaps hopped, but the greater number merely with a light bell hung to their neck to guide their owners in the morning to the spot where they might have rambled—the party were enjoying themselves after the fatigues of the day.

In anticipation all is pleasure, and these migrating bands feasted in joyous sociality, unapprehensive of any greater difficulties than those to be encountered in forcing their way through the pathless woods to the land of abundance; and although it took months to accomplish the journey, and a skirmish now and then took place between them and the Indians, who sometimes crept unperceived into their very camp, still did the Virginians cheerfully proceed toward the western horizon, until the various groups all reached the Ohio, when, struck with the beauty of that magnificent stream, they at once commenced the task of clearing land for the purpose of establishing a permanent residence.

Others, perhaps encumbered with too much luggage, preferred descending the stream. They prepared arks pierced with port-holes, and glided on the gentle current, more annoyed, however, than those who marched by land by the attacks of the Indians who watched their motions. Many travelers have described these boats, formerly called arks, but now named flatboats. But have they told you, kind reader, that in those times a boat thirty or forty feet in length by ten or twelve in breadth was considered a stupendous fabric; that this boat contained men, women, and children, huddled together, with horses,

cattle, hogs, and poultry for their companions, while the remaining portion was crammed with vegetables and packages of seeds? The roof or deck of the boat was not unlike a farm-yard, being covered with hay, plows, carts, wagons, and various agricultural implements, together with numerous others, among which the spinning-wheels of the matrons were conspicuous. Even the sides of the floating mass were loaded with the wheels of the different vehicles, which themselves lay on the roof. Have they told you that these boats contained the little all of each family of emigrants, who, fearful of being discovered by the Indians, under night moved in darkness, groping their way from one part to another of these floating habitations, denying themselves the comfort of fire or light, lest the foe that watched them from the shore should rush upon them and destroy them? Have they told you that this boat was used, after the tedious voyage was ended, as the first dwelling of these new settlers? No, kind reader, such things have not been related to you before. The travelers who have visited our country have had other objects in view.

I shall not describe the many massacres which took place among the different parties of white and red men as the former moved down the Ohio, because I have never been very fond of battles, and, indeed, have always wished that the world were more peaceably inclined than it is; and shall merely add that, in one way or other, Kentucky was wrested from the original owners of the soil. Let us, therefore, turn our attention to the sports still enjoyed in that happy portion of the United States.

We have individuals in Kentucky, kind reader, that even there are considered wonderful adepts in the management of the rifle. To drive a nail is a common feat, not more thought of by the Kentuckians than to cut off a wild turkey's head at a distance of a hundred yards. Others will bark off squirrels one after another until satisfied with the number procured. Some, less intent on destroying game, may be seen under night snuffing a candle at the distance of fifty yards, offhand, without extinguishing it. I have been told that some have proved so expert and cool as to make choice of the eye of a foe at a wonderful distance, boasting beforehand of the sureness of their piece, which has afterwards been fully proved when the enemy's head had been examined.

Having resided some years in Kentucky, and having more than once been witness of rifle sport, I shall present you with the results of my observation, leaving you to judge how far rifle shooting is understood in that State.

Several individuals who conceive themselves expert in the management of the gun are often seen to meet for the purpose of displaying their skill, and betting a trifling sum, put up a target, in the center of which a common sized nail is hammered for about one-third of its length. The marksmen make choice of what they consider a proper distance, which may be forty paces. Each man

cleans the interior of his tube, which is called wiping it, places a ball in the palm of his hand, pouring as much powder from his horn upon it as will cover it. This quantity is supposed to be sufficient for any distance within a hundred yards. A shot which comes very close to the nail is considered as that of an indifferent marksman; the bending of the nail is, of course, somewhat better; but nothing less than hitting it right on the head is satisfactory. Well, kind reader, one out of three shots generally hits the nail, and should the shooters amount to half a dozen, two nails are frequently needed before each can have a shot. Those who drive the nail have a further trial among themselves, and the two best shots out of these generally settle the affair, when all the sportsmen adjourn to some house and spend an hour or two in friendly intercourse, appointing, before they part, a day for another trial. This is technically termed driving the nail.

Barking of squirrels is delightful sport, and, in my opinion, requires a greater degree of accuracy than any other. I first witnessed this manner of procuring squirrels while near the town of Frankfort. The performer was the celebrated Daniel Boone. We walked out together and followed the rocky margins of the Kentucky River until we reached a piece of flat land thickly covered with black walnuts, oaks, and hickories. As the general mast was a good one that year, squirrels were seen gamboling on every tree around us. My companion, a stout, hale, and athletic man, dressed in a homespun hunting-shirt, bare legged and moccasined, carried a long and heavy rifle, which, as he was loading it, he said had proved efficient in all his former undertakings, and which he hoped would not fail on this occasion, as he felt proud to show me his skill. The gun was wiped, the powder measured, the ball patched with 600-thread linen, and the charge sent home with a hickory rod. We moved not a step from the place, for the squirrels were so numerous that it was unnecessary to go after them. Boone pointed to one of these animals which had observed us, and was crouching on a branch about fifty paces distant, and bade me mark well the spot where the ball should hit. He raised his piece gradually, until the bead (that being the name given by the Kentuckians to the sight) of the barrel was brought on a line with the spot which he intended to hit. The whip-like report resounded through the woods and along the hills in repeated echoes. Judge of my surprise when I perceived that the ball had hit the piece of the bark immediately beneath the squirrel and shivered it into splinters, the concussion produced by which had killed the animal and sent it whirling through the air, as if it had been blown up by the explosion of a powder magazine. Boone kept up his firing, and before many hours had elapsed we had procured as many squirrels as we wished; for you must know, kind reader, that to load a rifle required only a moment, and that if it is wiped once after each shot it will do duty for hours. Since that first interview with our veteran Boone, I have seen many other individuals perform the same feat.

The snuffing of a candle with a ball I first had an opportunity of seeing near the banks of Green River, not far from a large pigeon-roost to which I had previously made a visit. I heard many reports of guns during the early part of a dark night, and knowing them to be those of rifles, I went toward the spot to ascertain the cause. On reaching the place I was welcomed by a dozen of tall, stout men, who told me they were exercising for the purpose of enabling them to shoot under night at the reflected light from the eyes of a deer or wolf by torchlight, of which I shall give you an account somewhere else. A fire was blazing near, the smoke of which rose curling among the thick foliage of the trees. At a distance which rendered it scarcely distinguishable, stood a burning candle, as if intended for an offering to the goddess of night, but which in reality was only fifty yards from the spot on which we all stood. One man was withing a few yards of it, to watch the effects of the shots as well as to light the candle should it chance to go out, or to replace it should the shot cut it across. Each marksman shot in his turn. Some never hit either the snuff or the candle, and were congratulated with a laugh, while others actually snuffed the candle without putting it out, and were recompensed for their dexterity by numerous hurrahs. One of them, who was particularly expert, was very fortunate, and snuffed the candle three times out of seven, while all the other shots either put out the candle or cut it immediately under the light.

Of the feats performed by the Kentuckians with the rifle, I could say more than might be expedient on the present occasion. In every peopled portion of the State it is rare to meet one without a gun of that description, as well as a tomahawk. By way of recreation they often cut off a piece of the bark of a tree, making a target of it, using a little powder wetted with water or saliva for the bullseye, and shoot into the mark all the balls they have about them, picking them out of the wood again.

After what I have said, you may easily imagine with what ease a Kentuckian procures game, or despatches an enemy, more especially when I tell you that every one in the State is accustomed to handle the rifle from the time when he is able to shoulder it until near the close of his career. That murderous weapon is the means of procuring them subsistence during all their wild and extensive rambles, and is the source of their principal sports and pleasures.

Squirrel Barking.

EAST LEAKE, Va.—*Editor Forest and Stream*: I noticed the article in the last number of the FOREST AND STREAM (July 16) by Rifleman relative to the so-called squirrel barking, and also the editorial comment, wherein it appears a sceptic has arisen in an endeavor to dethrone this, one of our dearest traditions. I desire to contribute the following as at least showing that it can be done, and I have no doubt that expert riflemen could become so adept at the art as to accomplish it quite often. For the uninitiated, I would say that barking consists in hitting the bark of the tree with the bullet right under the squirrel and killing him by concussion.

It is, perhaps, proper to premise that I was not an eyewitness to the following episode, but that my uncle was an actor in the scene, and that both he and my brother, who was present at the time, vouch for it as absolutely authentic.

My uncle is a rifle shot of no little local celebrity, and as true a sportsman as ever threw out a fishing line or fired a gun. Some years ago he and my brother were out squirrel hunting together. Hickory nuts were plentiful that year, and anyone at all conversant with the habits of the game knows that a squirrel always did have a partiality for a hickory nut. In fact, whatever is a good mast year is a good squirrel year. Consequently the huntsmen had got a goodly bag when toward evening they had turned their footsteps homeward. On their way back they were passing through a group of walnuts, oaks, and hickory nuts that skirted a little ravine, when suddenly a squirrel ran up on the side of a tree about twenty-five yards away and stopped. My uncle whispered to my brother that he was going to shoot at the bark of the tree immediately underneath the squirrel, took good aim, and fired. At the crack of the rifle the squirrel tumbled. The two men picked him up and examined him thoroughly, and nowhere on him was found a single scratch, but high up on the tree was a white patch where the bullet had torn away a piece of the bark. They brought the squirrel home and skinned him in order to inspect him further, and, after a careful scrutiny, they detected right over his heart a slight bruise, the merest shadow of a blue spot.

Now, being fully cognizant of the extraordinary vitality of this little animal, I submit that, in the language of the doctors, he died "not from mortification, but from shock!" I submit, further, as to the traditions, myth busters don't always bust them! ORANOAKE.

LITTLE ROCK, Ark., July 23.—*Editor Forest and Stream*: I observe with interest a controversy between correspondents of your paper with regard to barking squirrels. Like Captain Kelly, I am disposed to incredulity as to much that is published of the experiences of sportsmen in the current periodicals. And yet, when I reflect, I know that such an attitude is unfair, for in my own hunting, snooting, and fishing experiences, from the Atlantic Coast to the Rockies and the Lakes to the Gulf, I have had the average sportsman's share of the improbable and sporadic events which occur in the conduct of game and guns, dogs and men, tackle and fish. I am more disposed to believe the tales of accomplishments by experienced sportsmen, well equipped as to tackle or gun, than to believe the rather fabulous traditions of the prowess of old mountaineers with flint-locks, or rustic youths with green poles and bent pins. I have knocked about considerably in the by-ways of this land without noting any remarkable accomplishment by the latter class, except that I have witnessed the mountaineer take a bigger drink of whiskey from a sportsman's flask than the owner could choke down, and the youth with the green pole is a eatfish annihilator, but I have not seen him toting home any fine strings of mountain trout or bass. But the object of this communication is to relate my own prowess as a squirrel barker.

About four years ago I was a guest at Big Lake Club, about twelve miles east of this place, and went one morning very early across to the vast forest on the south side of the lake to still-hunt deer. (All but pot-hunters and negroes have stopped hounding deer in this community.) I was armed with a .30-30 Winchester, smokeless powder, and soft-nosed bullets. Squirrels were abundant along the shores of the lake, and upon my return late in the afternoon from an unsuccessful deer hunt, I observed what appeared to be a whole family of squirrels in the top of a very tall cypress. I had no ammunition fit, but commenced to cannonade the top of the cypress tree with my dum-dum bullets and smokeless powder and high power rifle. Like the fabled rifle shots of old, I aimed at the squirrel's eyes, but did not hit any of them in the head or anywhere else; and yet, in the course of about a dozen shots, five squirrels fell dead from that tree. When a shot would strike a limb or the body of the tree under a squirrel he would let go all holds, bounce off about a foot, and come tumbling. It was my first observation of barking. I had not even heard the term before taking the squirrels to the club house and showing them to the gentlemen there, Mr. Julius Mons and Colonel Rottaken, both experienced sportsmen of this place. Colonel Rottaken said that he had often killed squirrels in such a manner, and I have no doubt of it. I tried the trick on a fox squirrel when deer hunting in the Maumelle Mountains, west of here about forty miles, shortly afterwards; but unfortunately the shot hit the poor squirrel in the middle and "hari-kari'd" him.

While reminiscing I am tempted to tell of an almost unbelievable experience with a nice, fat, five-point buck on the occasion of that trip. It is altogether a tale of poor marksmanship on my part and suicidal conduct on the part of the buck. I will reserve the yarn until some of your contributors lay down some hard and fast rules as to what a deer will do when an excited man is pumping at him with a Winchester. H. M. ARMISTEAD.

TARPON SPRINGS, Fla., July 28.—*Editor Forest and Stream*: I was lately talking with your old correspondent, Tarpon, who, like myself, is an old-time rifleman, and we agreed that squirrels can be barked. With your permission, I would like to ask the unbeliever if it ever occurred to him that before doubting the word of Audubon, he should have placed himself in the position occupied by Daniel Boone when he barked the squirrels?

The rifle used by Boone on the occasion referred to was doubtless much the same as those we carried fifty or sixty years ago, except that it had a flint-lock, which we did not often use, though they were not uncommon in the forties. It had an even twist, carried a round ball, and was generally fired with a comparatively light charge of powder. Conical balls, if known at all, which I doubt, were certainly not in general use, and the impact of a round ball, sent from such a rifle as I have described, would manifestly be totally different from that of a conical missile, when discharged from a modern high power weapon. The next time that Mr. Kelly wants to test the validity of this particular assertion, let him hunt up an old-fashioned muzzleloading rifle—there are a few left yet, though he might have to learn from some old-timer just how to load it—and see if the round ball does not tell a very different story.

About sixty years ago strong exception was taken by a southern writer in the Spirit of the Times to the statement that a fairly good target could be made at three hundred

yards. That seems odd now, but this view of the effective range of a rifle was, I think, very generally accepted. Nowadays, a ball drives through a soldier, and if it was sent from the military rifles in common use, the man may not know that he has been hit. This was not the case in the old days.

Among other things which I have learned in the course of a tolerably long life, is that it is rarely given to any—he sportsman or otherwise—to know it all. When I was a little boy I used to like to mold bullets for fun. They looked so bright and pretty. It is not very long since somebody asked the editor what sort of a thing a bullet-mold might be, and if it resembled a nut-cracker?

Even our poor friend, O. O. S., did not like to believe that brook trout could be taken by the hand, though I told him that it was a fact. And this again reminds me that once, up in Portland, Oregon, Mr. J. Roberts Meade told me of his first meeting with O. O. S. It was in camp, in some out-of-the-way place, and Meade had turned in, tired, when two men came to the door, also tired, and wanted something to eat and a chance to bunk down somewhere. Of course they were taken in, and the bacon set a-sizzling, and as soon as possible they fell to. Meade didn't pay much attention until one of the strangers dropped a word which he at once recognized, and sat up in his blankets. "Look here," said Meade, "are you O. O. S.?" The stranger looked up and nodded. "Because if you are, you can have my bunk, and my rifle, and my boat, and any other blasted old thing I've got in this camp." It was O. O. S., sure enough, and you may be assured that he was made most welcome.

I had intended to speak of some other matters, but will defer it until next time. KELPIE.

Editor Forest and Stream:

As I never barked a squirrel in my life, those killed by me in my youth having been brought to bag by means of a muzzleloading shotgun, it may be out of place for me to add my bark to the rest in connection with this controversy. Suffice it to say that Mr. Audubon's simple statement is sufficient for me.

The shooting of squirrels anywhere else than through the head "reminds me."

It was in Kentucky. A modern "side shoot" had been organized (the morality of which I need not go into here), the various birds and quadrupeds being marked up with number values to be taken into account at the final round up. It was stipulated that squirrels should count only when shot with a rifle.

It was a close contest, and when the game was being scored and valued at the end of the day, all kinds of feathered and furred specimens were brought forth from the game bags of the contestants, but for some reason there had been an absolute dearth of squirrels until the last man arrived, who saved the day by producing one. Offhand it looked as if his would be the winning side, when one of the committeemen demanded to see the squirrel. An examination showed that it had been ignominiously shot through the body instead of through the head, and a howl of derision going up, that settled it. There was no one who dared to defend the shooting of a squirrel through the body, and judgment was given accordingly.

The illustration of Davy Crockett's rifle reminds me of an incident which happened a year or two ago in New York. I was passing along West Forty-second street on my way to meet a train. I had no time to spare. Passing a second-hand store I noticed the proprietor in the doorway taking the lid from a home-made box, hewn roughly out of chestnut, and taking therefrom a magnificent specimen in the shape of a (Kentucky) rifle. One glance satisfied me as to its genuineness. I asked the price of it, told the man I'd take it, got the man to say he would keep it for me, and I hurried to my train, and when I came back the next day the rifle was gone. Evidently someone had come in, and the proprietor asking more than he asked me, sold it. Of course the fault all was with myself, but trains have a way of not waiting for people, and I lost my prize because of that. It was a relic that one could hang above the mantelpiece and study with pleasure, and conjure up things that it did in days that have gone. CHARLES CRISTADORO.

Editor Forest and Stream:

"The sun do move." The umpire decides that the evidence of squirrel barking is conclusive and the question is settled. Yet I may be permitted to remind my critics that my doubts were not of the marksmanship required in the feat, but of the effect of shock upon the squirrel. Perhaps the breed of gray squirrels I and others whom I know experimented on is tougher than the breed that so many of your correspondents say they have seen killed by transmitted shock.

It appears that Rifleman is something of a skeptic himself, even though he does accept some authorities on faith. He does not believe it possible to shoot accurately with a revolver, and he doubts my account of the shooting of a squirrel with .44 bullets.

I protest mildly against his statement of my argument. He sets up a man of straw, knocks it down triumphantly, and claims to have demolished me. Let me state it: Audubon says he saw squirrels killed by the shock of bullets which didn't touch them. I have seen squirrels unharmed by the shock of bullets imparted under exactly identical conditions. Therefore I doubt that squirrels readily succumb to such injuries, and also doubt the accuracy of Audubon's description. Incidentally the apparent discrepancy in the Boone-Audubon dates has not been cleared up.

The debate between us comes down simply to this: Rifleman accepts testimony which I do not consider conclusive evidence, and I know to be true certain things which cannot be proved to his satisfaction. Further argument would not lead to any conclusion.

The discussion has elicited much valuable information, however, on the subject of squirrel barking.

In Indiana the squirrel must be on a carefully selected limb, neither too large nor too small, and the bullet must be placed exactly under his throat. All the conditions being favorable, the squirrel dies suddenly of goitre or mumps or quinsy.

The Illinois squirrel must be maneuvered into just the right position, hugging closely the bole or a vertical limb

—horizontal limbs barred—and the bullet must pass directly beneath its heart.

Nebraska squirrels insist also on being barked exactly under the heart; under any other part of the body won't do at all.

Kansas—well, the old fellows in Kansas used to do it, and "kin do it ag'in, b'gosh!"

The squirrels of Allegheny are knocked out by hitting the limb a foot away from them.

In Canton, Pa., the only sure death to a squirrel is a bullet hitting the limb just under its neck.

Mississippi squirrels are the tenderest of all. They are killed by bullets passing through the hair across their bellies without touching either skin or bark.

All of which is very interesting and just a little astonishing, even if it is convincing. Wonder if I cannot start another dispute and draw out some more lively letters from the FOREST AND STREAM readers pretty soon? I'll think it over.

ALLEN KELLY.

An Old-Time Rifle Champion.

LOCKPORT, N. Y., July 22.—From the days of Cooper's Leather Stocking, when Natty Bumppo used to show the youngsters how to shoot turkeys in the Otsego country, to the modern contests of the Creedmoor crack shots is a long cry. But the old-timers after all, perhaps, could best "show the beauties of the weapon," as the chief hero of the boys' early novel reading used to say.

Of course, there are no representatives of the pioneer riflemen left. Even the exponents of the rifle shooting as it was conducted a half century ago, are now few and far between, with only now and then one who can draw a bead.

Niagara county boasts an old-time rifle champion, and one who can still show the young men with their .30-30's and other high velocity small bores how to draw a fine sight and hold it for proper and artistic execution at 100 rods.

James Carter, a retired manufacturer of the city of Lockport, twice won the New York State championship, and when urged will bring out his medals and the rifle that helped him do the trick. He is one of the oldest members of the venerable Niagara County Anglers' Club, an organization devoted to the promotion of both angling and shooting and the protection of fish and game, yet one of the most active. The stormiest night cannot keep him from the regular meetings of the club. In a blinding snow storm last February he helped plant 10,000 lake trout in Lake Ontario at Olcott, and on three successive days was also present to assist in depositing the gamy youngsters in their new home in the great lake. His age now prevents him from enjoying the sport of the gun afield; but occasionally on the rifle range or at the traps he may be found modestly teaching the youngsters how to shoot. With rod and line he is as skillful and keen as ever, and in the annual tournaments of the club always to be counted on for a creditable score.

Uncle Jim Carter's "den," at his home on Locust street, is a veritable arsenal and a depository for fine guns of many makes and patterns, worth in the eyes of the sportsmen and gun connoisseur a king's ransom. Uncle Jim was always an extremely modest man, and although he was counted one of the best shots with rifle or shotgun in western New York for years, he could not be induced to enter a regular contest for a championship until June 19, 1872. The old Niagara County Shooting Club organized a rifle contest, free for all, and offered a handsome \$50 cup as the prize for the best score. Several noted marksmen entered early, and local managers begged Mr. Carter to bring his Maynard and shoot for the honor of Lockport. The contest was keen, but Uncle Jim led the fourteen competitors by a comfortable margin when the targets were figured up.

He attended the annual State shoot at Watertown, N. Y., June 1, 2 and 3, 1875, under the auspices of the New York State Association for the Protection of Fish and Game. There he won the first prize in an off-hand rifle match, consisting of a special military Creedmoor rifle, the kind used in England in the international contests between English and American marksmen. To crown his triumph, Uncle Jim's favorite dog, Sancho, won first prize in the bench show in the small pointer class.

In June, 1880, James Carter again captured the State championship, winning first prize at Niagara Falls in the State tournament held under the auspices of the New York State Association for the Protection of Fish and Game, in the off-hand rifle contest.

In the seventies the Niagara County Rifle Club was a famous organization, reducing rifle shooting to a fine art. Turkey shooting at Thanksgiving time was the favorite sport in those days. The rules were 100 rods at rest or fifty rods off-hand, ten cents per shot. Guns of the finest make and scientific sights were used. Each contestant took especial pride in constructing a rest which would best assist him in running up a high score. Uncle Jim's rest was so constructed that the gun could be lowered or elevated at either end, or moved to the right or left at either end mechanically. When fired, the rest device permitted the marksman to move the weapon forward quickly after the recoil, and by means of the telescope sight attached to the barrel of the gun, he could see the exact spot where the bullet struck. This enabled the shooter to adjust his rest and range perfectly after the first or second shot. This was in a manner mechanical shooting, but as fair for one as for the other in a contest conducted on business principles, and for gobblers more than for glory.

Maynard rifles were the favorite weapons used those days. They had one extra heavy barrel for long range shooting. Carter cast his own bullets. Each was weighed accurately. He found that a bullet cast from very hot lead would be lighter because of greater expansion and subject to greater shrinkage when cool. He gave the subject scientific study and solved the problem of the ideal bullet for long ranges. He also weighed the powder charges, as the hand would not always press the same on the old powder horns. No reliance was placed on ordinary scales, but he imported scales from England, such as are used for weigh-

ing diamonds, and on which the smallest grain of powder will tip the delicate beam.

No one can convince the veteran marksman that the modern cartridges and modern guns are equal to the old scientific loads and the hand-made guns. But he is willing to let the youngsters stick to their own opinions. When they come home from their hunting trips empty handed, or with little to show for a lot of hard tramping, he is ready to tell them of the times he missed. When the boys trudge by with their new-fangled weapons a-shoulder, he beams down upon them affectionately. A good story of days past and gone the old man always has on tap for them when they stop, as they often do. Just to look at the veteran marksman and to hear him talk, is an appetizer for the range or for the woods, like Riley's old gunner:

"And it's when I git my shotgun drawn up in a stiddy rest, She's as full of tribulation as a yellor-jacket's nest; And a few shots before dinner, when the sun's a shinin' right, Seems to kind o' sorto sharpen up a feller's appetite."

M. H. HOOVER.

A Comparison of Rifles.

Editor Forest and Stream:

Your editorial in the July 30 number suggests a comparison.

The Kentucky Long Rifle.

Davy Crockett's long rifle which you described was 32-gauge or .52 caliber. Its spherical bullets must, therefore, have weighed 219 grains. If, as tradition has it, only enough powder was used to cover the ball as it lay in the palm of the hand, the load was bulk for bulk of powder and lead, which would give 34 grains of black powder. This would be about the same load as the .44-40-217, with less powder and therefore an even higher trajectory. It is, however, commonly believed that these rifles shot very flat, and while the bulk for bulk load may have been customary for short ranges and small game, I believe a much larger charge of powder was used for long range or big game. As a boy I hunted with a muzzleloading converted flint-lock shooting a small spherical ball, and if my recollections of the rifle are correct, the powder charge bulked much larger than the bullet and the trajectory was very flat.

The Kentucky rifle was long enough and heavy enough to have burned 70 grains of black powder without giving much recoil or sacrificing accuracy. There seems to be no reason why this should not have been done, and I believe it was done. If this was so, and Davy Crockett's rifle shot a 219-grain bullet with a velocity high enough to give it a flat trajectory, its shooting qualities would have been not unlike those of the .30-40-220, the Krag-Jorgenson. Used against living animals, its large wound of entrance would cause enough shock and external bleeding to more than compensate for its slight inferiority in range and power.

Express Rifles.

The original express rifle was brought out in 1856. It was designed to replace the big-game rifles of large bore—from 16 to 8 gauge. The object sought was a rifle whose trajectory would be so flat that the same elevation of rear sight would answer for all sporting ranges. To accomplish this object the caliber and weight of the projectile were reduced. The lessened weight of rifle and ammunition were, however, secondary considerations. The power was maintained by the high velocity. Thus was developed the black powder express, still largely used abroad for big game, shooting a projectile of from 350 to 590 grains, with a velocity from 1,800 to 1,688 foot seconds.

It was claimed that this idea was directly copied from the Kentucky long rifle, but Greener, in his "Gun and Its Development," seems disposed not to allow this claim, and to believe the principles of the express rifle to have been independently developed.

Military Smokeless Rifles.

Something the same plan as brought out the sporting express developed the military smokeless rifle. Here the prime desideratum was lightness of ammunition in order that the soldier might carry many rounds without being overburdened. Flat trajectory was a secondary consideration, but the same method was employed and much the same results were obtained, only on a smaller scale. The caliber and weight of the projectile were diminished and its speed increased.

Thirty years ago the type military rifle was about .45 caliber, burned about 75 grains of black powder, and fired a projectile weighing about 480 grains. Such a rifle was the English Martini .45-85-480; the U. S. A. Springfield, .45-70-500; the .43 Spanish, .4377-395; and the Russian Berdan, .42-77-370. In changing to the military rifles of to-day, smokeless powder was used, not to increase the power, for charges almost equivalent to the old black powder loads were employed, but to prevent undue fouling of the small bore.

The jacketed bullet was not designed from humane motives, for experiments on the human cadaver seemed to show that the full mantled bullet would have the explosive effect we now know is only produced on the live subject by some form of mushrooming bullet. The jacket was a device originally intended simply to prevent the bullet from stripping. The jacket and the kind of powder were technical details to render practical the light bullet and the high velocity which were the real objects sought. In short, the military smokeless powder rifle was designed to produce the same effect as its immediate predecessor, only with lighter ammunition, depending for its efficiency on velocity instead of weight of projectile. An illustration will show how closely the differences between the big bore rifle and the express parallel the differences between the black and smokeless powder army rifle.

For Big Game.				
Rifle.	Caliber.	Weight of Projectile.	Velocity.	Energy.
12-gauge	.72	700 gr.	1584 ft. sec.	3356 ft. lbs.
Express	.50	440 gr.	1784 ft. sec.	3134 ft. lbs.
For Men.				
Springfield	.45	500 gr.	1179 ft. sec.	1551 ft. lbs.
Krag	.30	220 gr.	1960 ft. sec.	1887 ft. lbs.

Were the .50-110 Winchester substituted for the Spring-

field in this table, the comparison would be more striking, as the .50-110 throws a projectile of 300 grains with a velocity of 1,536 foot seconds, producing an energy of 1,580 foot pounds, but the .50-110 is not, strictly speaking, a military rifle, and in either case the main point of the comparison is the same, namely, that for the same purpose old or new need the same power, but the new obtains its power from velocity, the old from weight of projectile.

The Kentucky rifle was the legitimate forerunner of both the express and the military smokeless powder rifle. It was the firearm to establish the principle on which they depend, which is that energy can be more economically transformed by giving bullets high velocity than by using bullets of heavy weight. All three belong in the high velocity class in contrast to the heavy projectile class comprising muskets, smooth-bores, big bore rifles, and the army rifles of thirty years ago. DAVID E. WHEELER.

BUFFALO, N. Y.

Raising Wild Ducks.

Editor Forest and Stream:

I am very much gratified to see that within the past few months the FOREST AND STREAM has been endeavoring to awaken interest in the subject of increasing our stock of game birds and wild fowls somewhat in the method in which, from time to time, our game fish supply has been increased. On the other hand, I very much regret that the shooting public seems to take not very much interest in this subject, if we can judge by the lack of communications about it to your columns.

Of course the matter is one about which the average man knows nothing, and one toward which the average man can contribute little except a very active interest. The people who must set on foot work of this kind on a large scale—provided the Government does not do it—are people of large means and possessing country places covering a considerable number of acres. Yet the subject is such an interesting one that I should suppose that the men who use the shotgun would have views on it that they would like to express.

I remember a few years ago Mr. J. B. Battelle, of Ohio, made a number of efforts to do something toward domesticating the ruffed grouse, and then had more or less to say on the subject. I remember also the case of a correspondent of yours living somewhere in New York, and, as I recall it, in very small quarters, who reared a brood or two of quail, almost in a cage. There are no doubt plenty of readers of FOREST AND STREAM living in the country who, at a very trifling cost, could make experiments in the domestication of game birds, and some one of these might contribute much that is new and useful to our knowledge of this subject.

We are all of us disposed to lament the constantly increasing diminution of game, and each one of us, while groaning about it, appears to be doing his best to increase the destruction. No one of us, however much he may grumble and growl, does anything to lessen the slaughter. We are all ready to complain, but not to make much effort to bring about better conditions. This is all natural enough. In this country, until within a comparatively short time, mammals, birds, and fish were meat, and as meat worth dollars or cents; and dollars or cents were the things about which the Americans chiefly thought. There were some notable exceptions, but not very many, until sometime after the war.

In Britain, where sport—as there regarded—has long had an importance much greater than it has ever had in America, they have carried the preservation and increasing of the game supply in various directions to lengths of which we know nothing. It has been pointed out in FOREST AND STREAM that, besides the domestication of pheasants and the not very successful rearing of partridges, grouse and wild ducks have been hand-raised on a very large scale. This, of course, is made possible by the vast size of the estates held over there—holdings which are matched only by some of the largest ranches in the West. In Cumberland, England, one land owner rears annually 10,000 wild ducks, of which about 6,000 are captured on his own estate, while 4,000 disappear to take their chances for life or death in other parts of Britain or on the Continent.

There are not a few places in Britain where during the season excellent duck shooting is had at birds that have been hand-raised. Sometimes these birds live in slow-flowing, weedy rivers, which resemble the streams of the South and some of those of the Middle West, or they may live in reservoirs, or again in artificially made ponds or pools. In some cases the birds spend the night on reservoirs or lakes, and twice a day are summoned by the sound of a horn to a special feeding ground at some distance from the roosting ground. Here the grain and other food is scattered for them, and they eat it undisturbed. It is on their flights to and from the feeding ground that they are shot, and so far as one can understand from the descriptions, this shooting takes place only at rare intervals. That is to say, a few times during the shooting season.

Along certain slow-flowing rivers bordered by wide water meadows in Hampshire, a method of shooting is practiced which depends in part on ducks that are actually wild. These slow streams and their surroundings offer a good deal of food to the ducks, and the number of birds there has led to a system of shooting out of what are called "gazes." These are nothing more than what we in America term "blinds." A portion of the river bank where ducks are accustomed to feed or sit is cut off from the meadow by a high fence near the bank, and this fence is filled in with green boughs so as to make a screen that the birds cannot see through. At intervals along this screen are built the blinds. The fence prevents the birds on the stream from seeing the gunner as he approaches the "gaze," but when he is inside of it, he can see in all directions, yet can keep himself out of sight, just as a gunner hides in a blind. These "gazes" scattered along the shore are occupied each by one of the guests at the shooting, the allotment being made by the owner of the shooting or by his keeper. After one section of the river has been shot over the party of gunners moves to another, and so systematically covers the whole length of the ground.

These "gazes," of course, are always on private property, and are private shooting; only the owner and those

whom he may invite to share the sport with him can partake of it.

On these streams, it is a matter of common observation that the great amount of food helps to attract the migrating birds in fall, and to keep them there, and the natural food is frequently supplemented by artificial feeding, such as throwing acorns into the water, or scattering Indian corn in the shallow places. There are places where owners have set aside small stretches of river or certain ponds or lakes where no shot may be fired, and in such places the ducks congregate in enormous numbers, and are so tame that they pay no attention to the people who may try to frighten them and make them take to wing. In a very few places in this country we have examples of this kind, and at one Florida resort—West Palm Beach—the wild ducks that winter there become so tame that they will take food from the hand. This territory is protected against shooting by State law, and is an object lesson to all gunners and game preservers, just as the Yellowstone National Park is such an object lesson.

SHOTGUN.

A Plan of Guide Registration.

WE have published from time to time notes of a proposed scheme of registration for the men employed as guides by clubs in the preserves of Quebec. Those who are interested have been developing the plan, and the following circulars have recently been sent out to the secretaries of the various clubs:

DEAR SIR:

The committee appointed by the Triton Club respectfully submit the following statement and enclosures, and in doing so earnestly request your co-operation and aid, especially in making suggestions and in endeavoring to bring our clubs together in a movement that should result in general benefit.

The object of this movement is to introduce some system of guide registration unencumbered with intricate detail, but sufficiently broad nevertheless to insure good service and protection to the better class of guides as against a set of worthless men who know little of the woods and still less of camp duties. As will be seen from enclosures, the restrictions are limited; in other words, the requirements for registration are very simple, and do not involve any detail which would trouble the most illiterate guide.

It seems to our committee that such a scheme can result in no injury to any club, or to the guides, and we believe that the fostering of some slightly restrictive action is quite advisable. It may be that some clubs are entirely satisfied with existing conditions, and may see no reason for any attempt at a change. On second consideration, however, and looking more to the future, it is the opinion of our committee that the present conditions can be improved without detriment to the interests of any of our clubs. The free exchange of guide lists and the holding of a complete list by each club, as issued by the proposed general committee, cannot work injury to any one, nor will any club have advantage over another. The idea that certain clubs have guides at present on their lists that are unknown to other clubs is rather childish, and no jealousy should exist in this respect. The Triton Club surely has as large a guide list as any other neighboring club, but the exchange of lists is considered by said club as highly advisable under the various restrictions and rules noted herewith.

The object of thus writing you is to ask your co-operation and aid; also to ask your advice and to secure all the suggestions in regard to changing the enclosures that you can possibly make. We must all work together in mutual interest.

Will you kindly reply as soon as possible, and later on, if the scheme meets with general approval, a complete or revised list of regulations will be sent you; and then, also, a request for you to name the party whom you would wish to represent your club on the general committee. A meeting will then be called and minor details attended to. Believe me, sir, yours very truly,

ANDREW GRAY WEEKS,
For the Triton Club Committee.

FORM OF AGREEMENT GOVERNING THE REGISTRATION OF GUIDES BY CLUBS IN THE PROVINCE OF QUEBEC:

Section I. No person shall engage as guide, either for inland fishing or forest hunting, until his name, age and residence is recorded in a book kept for that purpose by the local club superintendent or other authorized officer, and has procured a certificate from said authorized party, setting forth that he is deemed suitable to act as guide.

Section II. Each registered guide shall, as often as requested by the authority noted in Section I., furnish to said authority or the general committee a statement of the number of persons he has served in any one season, and such other useful information relating to fishing and hunting, the protection of the forests, and any matters connected with game and fish protection as may be requested.

Section III. Registration as is noted in Sections I., II. and VI. shall be provided for as follows: The applicant shall apply in person or in writing to the authorized parties noted in Section I., and as soon thereafter as may, the authorized party, after such investigation as he deems proper, and having obtained information suited to the interests of the possible employers, shall issue such certificate in the form prescribed.

Section IV. The authorized parties noted in Section I. may refuse to register any applicant whom they deem unfit to act as guide.

Section V. Whenever a registered guide, as provided in above sections, is guilty of any violation of any of the inland fish and game laws, or for any reason is deemed unfit, the authorized parties shall, at their discretion, cancel his certificate of registration and strike his name from the list of registered guides, and the certificate shall be immediately returned to the authorized parties.

Section VI. 1. No person shall receive a certificate as a guide unless he is of good repute, and friendly to the inland fish and game laws, and active in discountenancing all violations of said laws when brought to his notice. He shall be thoroughly competent to handle such boats or canoes as may be used in the locality in which he guides, and be familiar with the requirements usually expected by visiting sportsmen, and shall be a safe person under all circumstances, to guide inland fishing and hunting parties.

Section VII. Guides shall be subject to such instructions as the head guide deems proper and necessary.

Section VIII. There shall be no fee for registration, but no person shall be employed who is not registered under the terms of the preceding and following sections.

Section IX. The payment for registered guides shall be \$1.50 per day.

Section X. 1. Each club assenting to the regulations noted in Sections I. through IX., shall appoint one member of their club as a member of a general committee representing the assenting clubs.

2. Each member of the general committee shall furnish the chairman of said committee on or before Dec. 1 of each year, a list of the registrations in his club.

3. The general committee shall have an oversight of all registrations as prescribed in above sections; shall furnish each club a list of all registrations on or before Feb. 1 of each year; and shall distribute such printed instructions to guides and others as it may deem expedient and desirable.

4. The chairman of said general committee, until a successor is elected by said committee, shall be the one who is chairman of the Triton Club Guide Committee. The chairman shall be elected annually by the general committee.

Section XI. No club member or guests shall employ any guides on the club lands unless said guide is duly registered and can produce his certificate.

INSTRUCTION AND INFORMATION FOR GUIDES.

(On you depends the enjoyment of your employer. Make the woods disagreeable to him, keep the camp dirty, and he will not come back to you.)

Under an agreement made by the clubs noted below, no man

shall be employed by said clubs as guide who has not registered his name in accordance with the sections of said agreement. Such registration may be readily made by application to the club's superintendent where employment may be desired, and a certificate of registration will be issued to the applicant if he is considered competent. The possession of such a certificate will entitle the holder to employment in the lands controlled by said clubs, but no man can secure employment in these districts unless he has been duly registered. The matter of registration is very simple. If you have no certificate, you will apply to the club's superintendent when going into the woods, or by mail at any time, and a certificate will be given you unless there is some good reason for refusing it. Your name will then be entered on the books of the clubs and employment for you freely granted at any time when your services are required. You should keep your certificate with you in case an employer wishes to see it. By securing registration your name will be on the lists of all the clubs represented, and your opportunities for employment greatly increased.

The object of such registration is to protect the interests of men who are competent workers as against a class of incompetent men. Also to have guides guaranteed a payment of \$1.50 per day. A man who can handle a canoe, who has had experience with sportsmen in the woods, etc., can apply for a guide certificate.

The duties of a guide are well understood by most sportsmen, but sadly neglected by many guides who claim wages to which they are not justly entitled.

The rules and suggestions of the various clubs should be strictly followed, and the following suggestions may help those who desire to render good service to their employers:

1. Cleanliness.—Endeavor to be clean. A thorough washing of face and hands each morning with soap, is absolutely necessary. The cook should never handle any food without some thought as to his clothing and hands, which should be well washed always. He should keep the food supplies in as neat a condition as possible, and not waste any supplies. Wastefulness may result in a shortage of food and necessitate an extra trip out for additional food.
2. For refuse, dig a hole close to the camp and throw all such matter into it, keeping it covered each day with earth. Refuse scattered about promiscuously gathers flies in abundance, and your employer will not enjoy them.
3. Never, under any circumstances, allow broken bottles to remain about the camp. Broken glass in the brush is worse than a poisonous snake. If your employers break bottles in target shooting, it is your duty to gather and bury the glass for your own protection, as well as for the protection of others.
4. Tin cans should be buried. A camping place covered with such stuff is not attractive to your employer.
5. After cleaning fish or dressing game, see that the bones, etc., are not left to rot, but sink them in the lake or bury them.
6. Do not encourage your employers to take more fish or game than can be consumed in camp or shipped out. The supply of fish and game in these districts is what gives you employment. Without them your services would not be required.
7. Never leave a camp-fire burning. Never build a fire where its flame can communicate to grass or bush or overhanging trees. To put a fire out, pour an abundance of water on it and do not leave a single spark to smoulder. One spark and a good wind may destroy thousands of acres of timber. Burn down the timber and you will find it hard to secure sportsmen to camp in a burnt district. Remember that your interests are at stake more than the sportsman's, for he can seek other lands; perhaps you cannot.
8. Many a hunting trip has been spoiled by unnecessary noise in the camp. Keep quiet and avoid yelling, loud singing, etc.
9. Remember that your employers, the sportsmen, usually reside in large cities, and that their visit to the woods involves expense and is their one pleasure trip of the year. It is for your interest to make the camp as pleasant as possible by attending cheerfully to the various camp duties and the little requirements of the sportsmen, and it is also your duty to gain all information possible as to the best fishing and hunting spots and to know how to approach them.

CERTIFICATE OF REGISTRATION AS GUIDE.

This is to certify that....., of....., has caused his name to be registered as guide by the committee representing the clubs noted below, having been accepted by them as competent to fulfill the duties and requirements of said position. This certificate is issued under the agreement accepted by said clubs, and appearing on the reverse side, and under the conditions noted therein, to which the guide, in accepting this certificate, fully agrees. Signed....., Acting authority for the Club.

The Minnesota Law Upheld.

From the St. Paul (Minn.) Pioneer Press, July 30.

THE Minnesota game and fish law is held to be constitutional by the State Supreme Court in a decision handed down yesterday in the case of the State against Robert Poole and William Kerr, appellants, who were fined \$20,000 by the Jackson county district court with alternative jail sentences of 200 and 300 days respectively, on a charge of having ducks in possession illegally with intent to sell. The order of the lower court is upheld with respect to Poole's sentence, but Kerr is granted a new trial, on the ground that the evidence was insufficient.

The decision of the court is gratifying to Executive Agent S. F. Fullerton of the State Game and Fish Commission and to sportsmen generally, since the theory on which the game and fish law is based was involved. The contention of the defendants was that the fine, figured at \$10 a bird, was excessive, and that the law providing that the possession of each bird is a separate offense is unconstitutional.

The Supreme Court sustains the contention of the State that unless the penalty for violating the game laws of the State is commensurate with the number of birds killed or taken possession of illegally, the purpose of the law, which is to protect game from wholesale slaughter, is defeated.

"We are very much pleased over the decision of the court," said Mr. Fullerton yesterday, "for it establishes the constitutionality of the law. It is of great importance to game protection in Minnesota, and will be hailed with delight by those who wish to see our game and fish preserved."

The men were charged with having 2,000 ducks in possession near Lakefield. Evidence showed that Robert Poole, who was alleged to be in the employ of Kerr, a commission merchant at Lakefield, packed the ducks in barrels, placed the barrels in wagons, and started for market. The ducks were seized across the Iowa line near Montgomery. The Supreme Court holds that the evidence tending to show that Kerr employed Poole to sell the ducks was unsatisfactory.

The syllabus of the case reads:

The defendants were convicted of the offense of having in their possession wild ducks with intent to sell them as defined and punished by section 45, chapter 336, Laws 1903. Held:

The statute is not unconstitutional for the alleged reason that it provides for the imposition of excessive fines and the infliction of cruel and unusual punishments.

The court did not err by its refusal to instruct the jury to return a verdict of not guilty as to the defendant P., for the evidence was sufficient to justify his conviction. It was otherwise as to the defendant K.

The court did not err in its rulings as to the admission of evidence nor in its instructions to the jury except as to the defendant K.

Judgment affirmed as to one of the defendants, and reversed and a new trial granted as to the other.

START, C. J.

The Caliber of Spherical Balls.

PROVIDENCE, R. I., July 28.—*Editor Forest and Stream:* To make the information being gathered in relation to old-fashioned rifles in the "Squirrel Barking" conflict more complete, won't some enlightened individual please give us a list by which we can know the proper caliber of those arms. We users of modern rifles know what .22 and .45 means, but how are we to tell whether a rifle of .22 caliber or .50 was used by the old-time expression "32 to the pound," "52 to the pound." We understand, of course, that this expression means 32 round balls to the pound; but what would be the caliber of a rifle using 32 or 52 round balls to the pound? Here is a chance for someone to do good with a correct list showing the comparison in calibers.

A. C. H.

[In response to this request, we take pleasure in giving below a table of diameters of spherical lead balls, taken from the chapter on Gunnery in the Mechanic's and Engineer's Pocket Book, by Chas. H. Haswell:

NUMBER OF BALLS IN A POUND, FROM 1 TO 350.											
Diam. Inch.	No.	Diam. Inch.	No.	Diam. Inch.	No.	Diam. Inch.	No.	Diam. Inch.	No.	Diam. Inch.	No.
1.67	1	.75	11	.57	25	.388	80	.301	170	.259	270
1.326	2	.73	12	.537	30	.375	88	.295	180	.256	280
1.157	3	.71	13	.51	35	.372	90	.29	190	.252	290
1.051	4	.693	14	.505	36	.359	100	.285	200	.249	300
.977	5	.677	15	.488	40	.348	110	.281	210	.247	310
.919	6	.662	16	.469	45	.338	120	.276	220	.244	320
.873	7	.65	17	.453	50	.339	130	.272	230	.242	330
.835	8	.637	18	.426	60	.321	140	.263	240	.239	340
.802	9	.625	19	.405	70	.314	150	.265	250	.237	350
.775	10	.615	20	.395	75	.307	160	.262	260

From this it seems that balls running 350 to the pound weigh about 20 grains each. It must be remembered that these are spherical balls, while to-day practically the only balls known to the rifle shooter are conical and must weigh at least twice—and sometimes much more than twice the weight of—the spherical ball of the same diameter.]

From Currituck.

CURRITUCK, N. C., July 22.—Our first flight of yellow-legs arrived this season July 9, five days sooner than I ever saw them before. They are here now in great numbers; I saw at least 5,000 or 6,000 in one fresh-water pond yesterday; placed decoys, and in just eleven minutes shot twenty birds, all I could use; took up my decoys and came home. It would be an easy matter to bag several hundred to one gun in a day's shooting. They seem unusually abundant this season. Our quail crop on our island is also larger than ever before. It has been very dry and the birds being able to get water from the Sound have had nothing to destroy them. Wood ducks have also raised large broods, and seem to have increased very rapidly during the past few years. They cannot be shot without violating the game laws, which is the reason. We had a storm the past spring which caused the salt water to run across the beach into Currituck Sound and Back Bay, which has given us the finest growth of wild celery and other duck foods we have had in many years; so we expect good duck shooting when the season opens.

MORE ANON.

Minnesota Game.

ST. PAUL, Minn., July 25.—I am very glad to report that small game in Minnesota is going to be very plentiful the first of September, when our lawful season opens for all small game excepting ruffed grouse and quail. The severe weather we had last winter did not affect our quail at all, and there were more prairie chickens that wintered in Minnesota last winter than we have had for years before. One of the causes for that was that last fall was so wet and the shooters could not get out after the chickens until it was too late, and they were strong enough to take care of themselves. A very gratifying thing to us here is the way the quail are working north in our State. You know it has been contended that a very severe winter would destroy all our quail, but last winter was one of the severest winters we have had in Minnesota, and our quail has come out in flying colors. Our ruffed grouse are on the increase, thanks to the FOREST AND STREAM plank stopping the sale of all game.

SAMUEL F. FULLERTON,
Executive Agent.

Thoughtful.

GENERAL "JOE" WHEELER relates the following amusing incident that took place during the night of the El Caney affair:

"Gen. Lawton's division was marching back to El Poso, there to take up a new position in the morning. The general, in company with Major Creighton Webb, inspector-general of his staff, was standing at the edge of the road watching his troops file past. Just as dawn was breaking the colored troops came in sight. They gave evidence of being dead tired, but were nevertheless full of 'ginger.'"

"Gen. Lawton's attention was attracted to a certain corporal of the Twenty-fifth Infantry, a great six-foot negro, who, in addition to a couple of guns and two cartridge belts loaded full, was carrying a dog. The soldier to whom the other gun belonged was limping alongside his comrade.

"The general halted the men. 'Hecre, corporal,' said he to the six-foot man, 'didn't you march all last night?'

"'Yes, sir,' responded the negro, saluting.

"'And fought all day?'

"'Yes, sir.'

"'You have, besides, been marching since ten o'clock last night?'

"'Yes, sir.'

"'Then,' said Lawton, 'why on earth are you carrying that dog?'

"'Well, general,' replied the negro, showing his white teeth in a broad grin, 'the dog's tired!'"—From the Woman's Home Companion.

Trout Fishing on the Nipigon.

THE best speckled trout fishing in the world to-day is to be found in the Nipigon River, in western Ontario. Its waters are clear as crystal and ice cold, the rapids are numerous, and all the other conditions which go to make an ideal trout stream are there. And the trout are there, too. Not only are they plentiful, but they are of unusually large size. Speckled trout weighing as much as ten pounds have been caught in the Nipigon, and those of five and six pounds are common.

Besides the speckled trout, the river also contains lake trout, white fish, wall-eyed pike, suckers, sturgeon, and pickerel. The pickerel are a great scourge. They have insatiable appetites, and devour the young trout and the spawn. The Canadian Government is very wisely making war on them. Last year thousands of pickerel were caught in nets and destroyed. If this were not done, in a few years there would be no trout left in the Nipigon.

A trio of Amsterdams set out for the Nipigon on June 22 with the intention of despoiling that stream of some of its largest fish, and, incidentally, of enjoying one of the finest camping trips imaginable. Going to Montreal, we took one of the Canadian Pacific Railway's fine transcontinental trains, and after a delightful journey of 925 miles westward through a wild and pretty country, arrived at Nipigon station, near the mouth of the Nipigon River.

Here is located one of the oldest posts of the great Hudson's Bay Company. For more than two hundred years the Ojibway Indians from the region to the north, even as far as the Albany River, have come down to trade at this post, with their birch bark canoes loaded with valuable furs, which they barter off for supplies. This traffic still continues, though in a less degree. The wants of the Indians are simple, their supplies consisting principally of flour, sugar, tea, and pork. It is no wonder that the Hudson's Bay Company has grown rich, for it makes a good profit on the furs which it buys from the Indians, and another profit on the supplies it, in turn, sells to them.

As our train pulled in at Nipigon station, we found our eight Indian guides perched in a picturesque row on the railing along the station platform. We had hired them in advance, through the Hudson's Bay Company. Our head man was Joe Bouchard, one of the best guides on the river. His brother Jimmy was our cook, and the toothsome meals he prepared for us over a camp-fire in the open air were good enough to tickle the palate of an epicure. Among our other guides was Francois Kekek, the best hunter in the Nipigon country.

We had arranged with the Hudson's Bay Company by letter for our camping outfit and supplies, and the company's efficient and obliging manager, Donald MacDonald, had left nothing undone. Tents, blankets, tables, chairs, cooking utensils, provisions, in short everything necessary for a comfortable camping trip of three weeks, were in readiness.

We spent the night at Nipigon, a settlement of three stores, a hotel, and about a dozen houses, and early the next morning started by canoe up the river. Nipigon River is the outlet of Lake Nipigon, some forty-five miles to the north, and flows nearly due south into the north part of Lake Superior. A line drawn north from Chicago would pass a little to the east of the Nipigon. It is a beautiful river, broad and deep. Swift rapids are numerous, and there are many wooded islands. In several places the river widens out into lakes, which have little or no current. Virgin forests line its steep banks, and stretch unbroken for many miles, a paradise for the hunter. Moose, caribou, and deer abound, and each year they are growing more plentiful, as nobody hunts in this vast wilderness except a few scattered Indians, who kill only enough to supply their table.

Our fleet of four birch bark canoes presented a pleasing picture as we proceeded up the river, each canoe having a crew of two Indians, one rowing at the bow and the other paddling at the stern, while we reclined luxuriously on comfortable seats, with nothing to do but smoke our pipes and enjoy the splendid scenery.

At the end of twelve miles we came to a swift rapids and falls, around which it was necessary to make a portage of two and a half miles. This is known as "Long Portage," and used to be the hardest part of the trip up the river, but now a man keeps a team and wagon there which can be hired to convey the outfit across. Taking advantage of this, it was not long before we were ready to embark again at the head of the falls.

Here the river widens out into what is known as Lake Jessie, the upper end of which we reached before night came on. Everything was at once unloaded, and the manner in which the Indians pitched the four tents and established camp would do credit to a circus. Meanwhile the cook and the "cookee" had the fire going, and soon we were served with a nicely prepared meal. Nor was the appetite lacking.

After a good night's rest we continued our journey, and having made two short portages around some rapids, camped for the night at the lower end of Pine Portage. In front of our camp was a rapid, a good place to fish. Next morning, while the Indians were carrying our outfit over the mile and a half of the portage, two of us went

out in a canoe and trolled, using phantom minnows. Soon there was a violent tug on one of the lines. It seemed too strong for a fish, so it was decided that the hook was fast on bottom. The canoe was accordingly backed by the obedient Indians, and the line reeled in. However, a series of sharp jerks soon told us that we had hooked our first Nipigon trout. After a sharp fight, the guide at the stern scooped him in with the landing net, remarking as he did so, "pungee," which is the Indian for small. We did not agree with him, for we found we had landed a beautiful speckled trout weighing $3\frac{1}{2}$ pounds. However, we had not fished many days before we, too, got to regard a $3\frac{1}{2}$ -pounder as "pungee." In fact, several times we caught so many trout that we threw back some weighing as much as $4\frac{1}{2}$ pounds. We continued to fish at Pine Portage for half an hour, during which time two more trout were landed, one weighing $3\frac{1}{2}$ pounds and the other 4 pounds.

In the middle of the afternoon we arrived at Camp Victoria, about thirty-two miles north of Nipigon station, and here we made our permanent camp. It is an ideal camping place, being a smooth, rocky point that extends out into the river, catching every breeze, and consequently being almost entirely free from mosquitoes, black flies and gnats, which at some places on the river are a source of great annoyance.

We were now on the best part of the river for fishing. Directly in front of our camp was a rapid which afforded excellent fishing, and above us, all the way to Lake Nipigon, almost the whole course of the river was fine fishing ground.

We soon learned that the trout would not rise to a fly this year, and that the best bait was live minnows. These were easily scooped up in nets near the shore, and were used either on Archer spinners or on two regular hooks tied together, one above the other. We used six-foot leaders.

Many, no doubt, think that on a stream like the Nipigon, where the fish are so plentiful, all one has to do is to cast in his bait and haul out a trout every time. This is far from being the case to-day. Ten years ago the fly-fishing was excellent, and doubles were frequent. In those days a piece of red flannel on a hook would catch a trout. There is no doubt that there are just as many trout in the Nipigon to-day as there ever was, but the stream has become so famous that it is visited annually by a large number of fishermen, and consequently the trout have become shy and wary and only strike at a lure that is handled with some degree of skill. Flies they will not touch. However, the fishing with live bait is all that could be desired, and we were at all times easily able to supply the eleven hungry mouths of our camp with all the trout they could eat. And when it comes to eating trout an Indian can outdo a white man every time. This year the fish are very fat and the flesh very firm. A large fat trout stuffed, rolled up in brown paper, and baked beneath the coals, made a most tempting repast. We also had them fried, broiled, and boiled.

For twelve days we enjoyed camp life to the fullest extent at Victoria, fishing nearly every day, and having excellent sport. Some days we caught more trout than we could use, and threw back those that were not badly injured by the hook. The largest speckled trout caught tipped the beam at a trifle over seven pounds, and a number were landed that weighed considerably over six pounds.

There were some deep pools where we could lean out from the bank and, looking down, see a large trout lazily fanning his fins. Then came the interesting experiment of trying to catch him, and it often happened that when a fat and tempting minnow was carefully allowed to float down past him, he would rise out of the water with a mighty rush and seize it. Then the fight was on. Such a trout would usually be a large one, "the master of the pool," and his struggle was apt to be a game one, with many fierce rushes, and much consequent letting out and reeling in of line, before his lordship finally yielded to the landing net in the skillful hands of the guide.

It may easily be concluded that our stock of fish stories is a large one, but we will resist the inclination to relate them here. We might tell about the large lake trout that had eaten a young rabbit, to say nothing of some two dozen minnows; or we might mention finding a thick stone two inches square inside a brook trout; and then there is the large trout, deformed by a lump on his side, which was caught, thrown back, and later caught by another one of us; or we could tell of the cast that caught two large trout on a single minnow impaled on two hooks; or last, but not least, of the 10-pound brook trout (weight estimated), the granddaddy of them all, which got away after being hooked and played for twenty minutes. But from all this we refrain.

At Victoria the nights were quite cold, with an occasional frost. Several times the northern lights were plainly visible. The days were for the most part cool and delightful. There was only one day when it was uncomfortably warm, and on it we screwed up courage enough to go in swimming. It was like a plunge into a tank of ice water, but it was refreshing, though on coming out our bodies were of a fine purple color.

We celebrated the Fourth by making a magnificent catch, one of which was a $12\frac{1}{2}$ -pound lake trout. In the

evening a point of land along the river near our camp suddenly became brightly lighted up with a large number of birch bark torches. The Indians had remembered that it was a great American holiday, and had quietly prepared this illumination as a surprise for us. It is needless to say that we were very much pleased, and we responded with cheers and the shooting off of rifles.

Francois Kekek, the captain of my canoe, is acknowledged to be the best hunter in the Nipigon region. One day he and I went out with the idea of getting a look at some moose or caribou, if possible. Leaving the river, we climbed a steep cliff to a fairly level plateau. It was not long before Kekek discovered some fresh tracks. "Three moose, two big, one small, pass to-day," he announced, though how he could tell was a mystery to me. Then came an exhibition of tracking that was truly remarkable. He followed unerringly tracks that to me were invisible, and for several miles we proceeded cautiously through a splendid virgin forest, fighting off swarms of bloodthirsty mosquitoes as best we could. A cloud of these pests constantly surrounded us. At last we came to a marshy pond, and disappointment was in store for us, for the tracks we were following showed that the moose had evidently heard or scented us, and had broken into a run. "Moose gone," said Kekek. Coming to a small brook, we boiled tea and had lunch. Game signs were everywhere in evidence, and Kekek soon took up a fresh caribou trail, which we followed up for some time and finally got within range of the game, a large bull. The Indian, being ahead, fired, but, much to my surprise, missed. It was now time to start back to camp, so this ended our hunting, which, though unsuccessful, afforded a wonderful exhibition of Indian woodcraft.

We paid two visits to Lake Nipigon. It is a beautiful body of water about 100 miles long and 50 wide, studded with a great many pretty wooded islands. A number of Indians live here in the primitive manner we read about in the story books. Their habitations are crude birch bark wigwams, some of which we inspected. One family in particular seemed to be fond of pets. They had a bear cub, with one foot missing, a cat, and at least a dozen dogs running about. A papoose, strapped to a board swung from above, was peacefully sleeping. In the center of the floor of the wigwam a fire was burning, the smoke escaping through a hole left in the top for that purpose. Outside some moose skins were tanning in the sun, and a white rabbit skin robe was airing. These Ojibway Indians are a simple, good-natured people, and we pleased them greatly by taking their photograph.

We met a party of engineers crossing the lake, bound for the work of surveying for the Grand Trunk Pacific Railway. This great transcontinental road will pass eight miles north of Lake Nipigon. The line runs for hundreds of miles through an unbroken wilderness. It is expected that this eastern portion of the road will be completed and in operation in about two years, thus making accessible for the sportsman a vast hunting and fishing region, many of whose lakes and streams are not on the map, and have never been fished.

We had our Indians mount the skins of several of our largest trout on birch bark, framed with spruce with the bark on. This they do very cleverly, and the result is a handsome trophy, which can be used to prove some of the fish stories which are bound to be told during the long evenings of the coming winter.

On Sunday morning, July 10, we broke camp, and with much regret turned our backs on Camp Victoria. That night we camped at The Narrows, and Monday afternoon found us back at Nipigon. Tuesday morning the guides, dressed in their best Sunday clothes, came to the hotel to say good-by, and entertained us with some of their Indian dances, to the music of a fiddle played by "Jimmy, the Cook." At noon we boarded the train for Montreal, and were soon back in civilization once more, with nothing but pleasant memories of the good old Nipigon.

GARDINER KLINE.

Herb's Big Trout.

SUTTON JUNCTION, Quebec.—The previous day had been sizzling hot—a typical July day; showers during the night had cooled the air so that the morning was uncomfortably cold, with a suspicion of mist and a light wind blowing that would just ruffle the surface of the water, making it an ideal day for fishing.

We had in our family an automatic reel; also a little finger with a constant itch to "do it," or, as the owner of that finger, I felt it my duty to go fishing; so persuaded my wife to drive me about three miles up the mountain road, where I expected to get either Art or Hib to accompany me to Long Pond, a nice little body of water where we transplanted some brook trout a few years previous and had not paid it a visit since, but had heard rumors of one or two good catches the present season.

Hib was not at home, but Art was there, also his brother-in-law, Herb, a kid with a fish-hook nose, a fisherman himself and the son of a fisherman. We told him we were due to leave in twenty minutes, and, like time and tide, would wait for no one. He had half a mile to drive, also an engagement (which did not count) to help his father raise the roof timbers of a new barn; but he was

back on the stroke of the minute. We learned later he tied his horse to the shed, threw his rod and basket out the window, and came to us as the crow flies, via the back door.

It was now 11 o'clock, and we had before us a four-mile drive and an hour's walk up the mountains. We negotiated the first, but extensive lumbering operations had blotted out our landmarks along the trail, and we were undecided as to which of the many roads to take. Fortunately for us, we ran across a couple of lumbermen, who soon put us right, and we reached the pond, ate our lunch, and were ready for work by 2 P. M.

We secured an old log raft which would hold the three of us if we kept it properly balanced, and shoved off. The water went from nothing at the shore to twenty feet ten yards out, and Art immediately hooked one that started for the bottom good and strong. Art began to yell that he had a whale, and handed me his rod. It felt like a big one, and I handled him very carefully for a while before bringing him to the surface. He proved to be a half-pounder hooked through the tail just back of the belly fin, which accounted for the fight he put up. We caught no more there and soon moved to the opposite side, near an old hemlock that lay in the water at right angles to the shore, where we had seen several rise. I exchanged my steel for Art's fly-rod, and began casting with a Parmachenee-belle and silver-doctor, flies that are usually good killers in our waters. But though they were rising all around us, I could not get a strike after presenting them with a greater variety of colors. I tried a spinner with no better luck. The boys had in the meantime landed about half a dozen beauties, so I exchanged my lure for a hook and leader, baited it for the daddy of them all, and plunked in. Still nothing doing. I began to think I was hoodooed, till the boys told me to use less bait. I did so, and was soon hitched to one, and from that on did business regularly. I found they had a preference for two medium sized worms threaded on a No. 6 spout in a way that left both ends of each worm dangling about an inch. After taking a few nice ones, they stopped biting, and we moved about a boat length further out and dropped anchor.

We were fishing in twenty feet of water, ten feet down, and Herb's hook had hardly straightened the line before his tip went under with a rush. The line did not seem to be running free, for half his rod was under water before he had him checked, and it was fully five minutes before he got him near enough the top to size him up, and we got busy right away making guesses on his weight. Herb was for taking him in at once, but as we had no landing net and did not want to lose him, we kept him at it; and in the meantime Art and I were getting good sport with trout that would run from three to the pound to three-fourths pound each. Twice we had three in the water at once, and Herb began to think that while he was playing trout, we in turn were playing him for a sucker, or getting the cream of the sport. Art finally unslung his creel, transferred his trout to my basket, and told Herb to lead him in. As he came to the side of the raft, a quick dip landed him in a doubled up position in the basket, the cover was snapped down, and he was ours. We came near spilling off the raft by all rushing to the side to get a look. We were over our knees in water before we realized we were out of order.

We made several guesses at his weight, but underestimated him in each case. He weighed a little over 2¾ pounds after lying over night, and was the finest trout taken in this locality in years. We had him mounted and placed on exhibition at the post-office, and Herb's reputation as a fisherman is assured.

WARRINGTON.

Fish Chat.

The Sea Trout Again.

EARLY in May of the present year I received a letter from a friend in Lockport, Nova Scotia, a small town situated about half way between Liverpool and Shelbourne, in which he described in glowing terms the tidal or sea trout, which were abundant all along the shore in that neighborhood. My friend, in describing the trout, said they attained a generous size, were almost of silvery brightness; that they were very gamy, and took the fly when cast from the shore in the neighborhood of the estuaries of the streams which empty into the bays on both sides of the town.

In his letter he extended a cordial invitation to me to pay him a visit, bring my tackle along, and try my luck with the fish. Unfortunately I could not make arrangements to visit the place until early in July, and on arriving there I found that the tidal trout had disappeared from the shore, having ascended the Sable, East, and other rivers in the neighborhood.

Now, I have for years been interested in the history of the so-called sea trout, and was greatly disappointed at not having arrived in time to procure some this year in salt water. A number of years ago I, in common with many other anglers, entertained the belief, or vaguely had the idea, that we have on the northern Atlantic Coast, in the Gulf of St. Lawrence, and the Baie des Chaleurs a sea trout similar to the European species, or rather that that species visited our shores more or less often and in greater or less abundance; and to prove that the belief was correct, I spared no effort nor begrudged any expenditure of time and money.

Anatomical Peculiarities.

I visited almost numberless localities in the Dominion where sea trout abounded, and first and last handled many hundreds, perhaps thousands, of fish; but, although I studied them closely, I could not detect any anatomical difference between them and *S. fontinalis*. Fin rays were counted in hosts of specimens, hundreds of scales were examined microscopically and compared with those which were taken from fish which were unquestionably *fontinalis*, and other points of structural peculiarity were carefully compared. I even went so far in my researches as to visit those northern regions in midwinter, cutting holes in the ice in tidal waters and far up one or two of the rivers to obtain specimens, but I could not find anything so peculiar in the so-called sea trout as to characterize them as a distinct species.

It may be readily seen, therefore, that I hailed with de-

light the opportunity to examine the tidal trout that were mentioned by my friend, and perhaps throw a little more light on the vexed question of its identity; and it goes without saying that my disappointment was great in not being able to obtain any specimens in the salt water, for it was from them that I expected to obtain evidences of structural peculiarity, if such existed.

Specimens of the same fish, however, taken a considerable distance up the Sable River which local anglers pronounced to be the sea trout, show no characteristics different from those obtained in other localities; the so-called tidal or sea trout of that region are *S. fontinalis* without a doubt. While at Lockport I interviewed a number of local anglers and net and hand-line fishermen, and gathered some points of information which may be worth putting on record here.

Important Facts.

Among the gentlemen from whom data were obtained, was Dr. F. C. Lockwood, who has for years been a successful practitioner in the town, and who is a good observer and an enthusiastic angler withal. In his belief the so-called sea trout and spotted river or brook trout are identical. He states that early in April they come down the rivers on this coast and enter the salt water; that they are then in very poor condition, being gaunt with very little flesh on them; they are, in fact, spent fish, or "slinks," or, as we would term them, if they were salmon, kelts; that during the month of May they hover about the estuaries of the rivers in the bay, and even ascend the streams in pursuit of the herring and smelts, upon which they prey; and that they return to, and remain in, tidal water through nearly the entire month of June, where they subsist upon young herring, smelts, and other small fry, and become exceedingly well conditioned, being plump, of bright color, and very strong and gamy; they then reascend the rivers, where they remain until the ensuing spring, soon taking on the livery of the brook trout and resembling it in every respect.

Sea Trout Not Found in the Sea.

The Doctor further asserts that the fish is never taken in the bays at any distance from the estuaries of the rivers; that he has questioned scores of fishermen, and that their report invariably is that they never capture in herring nets in salt water a sea trout at any considerable distance from the shores or from the mouths of rivers. I also pushed my own investigations among netters and "bankers," but not one could say he ever knew of a trout being taken in deep water. One of them who has followed the sea all his life, said that he occasionally found a sea trout in his herring nets when drawn near the estuary of East River, but the occurrence was a rare one.

Now, this habit of these trout of remaining in the rivers after spawning and until the spring, as described by Dr. Lockwood, differs from that of the sea trout which ascend the New Brunswick rivers, for they very generally descend to the salt water after the spawn is cast, or at any rate before very cold weather sets in and slush ice is formed. I have proved this on more than one occasion by ascending some of the noted sea trout rivers to some of the upper pools, in which during the summer the fish are very abundant, and, cutting holes through the ice, endeavored to secure them with bait, but hardly a fish was to be obtained; they had, according to the guides on the rivers, returned to the salt water, but I had no difficulty in obtaining them at Campbellton at the head of Baie des Chaleurs, the Micmacs capturing them in considerable numbers.

Now, these last named fish may be said to possess the anadromous habit, for they seem to pass the greater portion of the year in tidal waters, ascending the rivers for the purpose of spawning, and descending again after the spawn is cast, and this is a difference of habit from that of the fish of the rivers of the eastern shore of Nova Scotia, which, according to Dr. Lockwood, remain in those streams at least three-fourths of the entire year, descending to the salt water only for the purpose of recuperation. This difference in habit is no doubt due to environment, and is not sufficient to cause the fish to be separated as varieties of the same species, for they are alike in every respect, and are all of them, undoubtedly, our dear old friend the spotted brook trout, which has gladdened the hearts of thousands of anglers, and will, I hope, continue to gladden them for many generations to come.

Salmon Culture in America.

In FOREST AND STREAM for July 16, The Old Angler takes exception to statements made in my communication printed in the issue of the paper of July 2. While we agree on the one important point that the privilege now enjoyed by salmon netters should be very greatly curtailed, we disagree in our views in relation to the artificial propagation of the fish. I have no desire to enter into any newspaper controversy with any one, and certainly not with The Old Angler, who is not only an interesting writer, but who is also bristling with a grand array of facts and figures to support the theories he maintains; but it seems to me in this case I should make a brief reply to some of the statements he has made in his communication relative to my views on salmon culture.

Visible Results.

First, in relation to the rivers I have named in which beneficial results have followed the planting of salmon fry, the claim I made was that the stock of salmon in those rivers is larger, even now, notwithstanding the excessive netting that has been practiced, than it would have been had no fry been liberated in them. In the Merrimac and Penobscot this is, in my mind, unquestionably the case, although The Old Angler declares "There is not a particle of evidence that the increased stock comes from the fry planted." That the Port Medway River, one of the best salmon streams on the eastern coast of Nova Scotia, has been benefited by artificial restocking, everyone in that section whom I have interviewed agrees; notwithstanding the great amount of netting that is done at its mouth, anglers have had better sport in the last ten years than they had twenty-five years ago. I have had as boatmen and guides several of the Penobscot Indians whose homes were on the river near Greenfield, and their statements agree with those of other residents of that neighborhood.

Wanton Destruction of Young Salmon.

I have seen several of the above named Indians on a number of occasions peddling salmon smolts by the hundreds at Greenfield and Molega, and asked them how it happened that they could get so many of the smolt, when thirty years ago very few were to be seen, and why they were permitted to catch the young salmon for sale in such great numbers. In reply to the first question they stated that the fish were more plentiful since the river had been restocked by the fishery officers, but their answer to the second question was the statement "The law lets Injun do it," and this was accompanied by a broad but significant grin. It is hardly necessary to state that if the hundreds or perhaps thousands of young salmon which were thus wantonly destroyed had been permitted to mature, the river even now would be better stocked than it is.

Excessive netting at the mouth of this river is still carried on, as it is almost everywhere in the Dominion, and the wonder to me is that a salmon is left to ascend the streams. Not only is netting carried to excess along the shores on both sides of the estuaries of the rivers, but in some of them it is pursued far up the streams. In the St. Mary's, for example, nets are set all along both sides of the river as far as tide water extends, or at least nine miles from its mouth. In the Dunk River, P. E. I., I have not had the personal experience that I have in many other Canadian streams; I fished it in 1880, but although it was, as I considered, a promising salmon stream, I did not get a fish, and was informed by Mr. Bearston, of Malpeque, that an angler would be "scared out of a year's growth if he got a salmon in that river." My last visit to the island was in 1888, for plover shooting, when I was informed by one of the bank officers at Summerside, whose name I cannot now recall, that the Dunk was, in consequence of having been restocked, a fairly good salmon river.

Of course, a large portion of the information I have been able to gather during the past forty or fifty years in relation to fish has been, as The Old Angler implies, hearsay, but I have endeavored in gathering it to gather judiciously, and have printed only that which I thought to be accurate.

I have knocked around a good deal, however, and from my own personal observation have been able to pick up many facts that have since proved of value; it is true. I have not had the experience among hatcheries that he has had, but I have first and last visited nearly all there are in the Dominion and in the Eastern United States. I have watched the operations conducted therein with intense interest, and as I witnessed the wonderful work that was being done, I could not but regard the artificial reproduction of fish as one of the greatest achievements of the nineteenth century, and nothing that can be said will ever cause me to believe otherwise; and I am now, notwithstanding the facts and figures The Old Angler has put forth, firmly convinced that it will be due to the artificial propagation of the salmon that our rivers will be stocked with the fish, if they are to be stocked at all, for the natural supply will not henceforth be sufficient to meet even moderate demands of the netters and anglers, and that the culture should be pushed to its fullest extent.

Treatment of the Fry.

It has been stated by The Old Angler that the artificial propagation of salmon has in a large measure failed of success because of the treatment the fry received, they having often been "dumped by" millions into rivers and parts of rivers not at all suited to their healthy growth, and that, after being transported in tepid water by steamer, rail, and wagon many miles—often hundreds—from which millions no results are ever seen." But that does not prove artificial propagation should be abandoned, and the contrary might be shown by a dozen familiar illustrations, one of which can be easily understood by all. A poulturer with a large number of fowls, who finds it unprofitable to have dozens of setting hens about his premises, puts four or five hundred eggs in an incubator, and hatches them; the percentage of chicks obtained from the eggs in a modern improved incubator is very high. I have seen settings in which nearly every fertile egg produced a chick; the chickens thus hatched are as strong and vigorous as those incubated in the natural manner, and they are not, moreover, when at a tender age, enfeebled by the attacks of vermin which infest the body of the mother bird. Now, if the poulturer turns those chickens loose in the wet grass, in unhealthy localities, without providing for them proper brooders, food, etc., the mortality among them becomes very great; in fact, it would be a wonder if any of the chickens should survive. They must be liberated under proper conditions, and, if those conditions are not supplied they perish; but that they did is no argument against the artificial manner in which they were hatched.

Hatchery Fry Strong and Healthy.

I have repeatedly watched the operation of taking the ova from salmon, the impregnation of them with milt taken from the male fish; have seen the fry develop and come from the egg and watched them through their early fryhood, and believe—and I do not think The Old Angler will differ with me—that those fry so artificially propagated are as strong and healthful as any hatched in the rivers from spawn deposited by the parent fish. The process is also an economical one, as compared with the natural method; for in the former nearly every egg is fertilized, if manipulated in the proper manner, while in the latter, a wasteful one, hardly five per cent. of the ova cast being fertilized. Now at first glance it seems presumptuous to call nature's processes wasteful, but if we watch many of them closely we find evidences of their prodigality on every side; the laws governing them were framed for conditions which do not now exist, for natural conditions are departing from us on every hand, and civilized man at the present time, if he had not improved on nature's methods, would be but little better off than is the Eskimo or Hottentot. If nature had not been improved upon, our modern magnificent fruits and other varied food products would be an unknown quantity. The wastefulness of the method exhibited in the natural reproduction of the salmon was amply sufficient for the continuance of the species when original conditions prevailed, a fertilization of only five per cent. of the ova cast was enough to stock the rivers to a proper capacity; the fish then had but few enemies in the rivers, and those

were not, as a rule, with the exception of the otter and the red man, very destructive ones, but the white man came with nets, weirs, and other engines of destruction, and the five per cent. fertilization of the ova proved insufficient to keep up the stock. Now it would seem that a process of propagating the fish by which 95 per cent. of the ova become fry and only five per cent. are lost, is preferable to one which saves but five per cent. and wastes 95, the health and general conditions of the artificially hatched young being as good as those of the fry hatched in the natural way.

When Doctors Disagree Who Shall Decide.

My rejoinder has already become too lengthy, and I must draw it to a close. That I am not alone in my belief that the hatcheries should be maintained and that artificial propagation of the salmon shall continue, I have had abundant proof by interviews and correspondence with some very intelligent observers. Recently, in a conversation with Mr. L. S. Ford, the overseer of fisheries for the counties of Lunenburg, Queens, Shelbourne, Yarmouth, Annapolis, and Digby, N. S., who has had many years' experience, and whose father was also connected with the Department of Fisheries, he having been the first of all the officials to hatch and plant fry in the Liverpool River, declared emphatically that in his opinion the hatcheries and artificial culture of the fish should not be discontinued; that his experience had been that all the rivers that had thus been restocked, which came under his supervision, had been very greatly benefited. He said further that there was no difficulty in distinguishing the progeny of fry which had been thus planted, as, for example, at least 50 per cent. of the salmon now taken in the Liverpool River are either fish which were put into the river years ago as fry or their descendants; that they could readily be identified by their peculiar form, which was quite different from that of the original Liverpool salmon, which were slim fish with no great depth of body, while the others which were hatched from ova which came from the Bedford hatchery were very deep bodied, compact fish; he further stated that the stock from the planted fry has increased to such an extent that a single angler obtained in a half day's fly-fishing in June last at Milton, two miles from the town of Liverpool, and on that river, thirteen grilse which averaged in weight about three pounds. As an evidence of the success that is attained in planting salmon fry, he stated that a few weeks ago sixty thousand fry were placed in the Nictaux River, of which number only three were lost during the entire process of handling, transportation, and planting.

In conclusion I will say that if any evidence is needed to prove that the artificial culture of salmon is feasible and desirable, it may be seen in the magnificent results which have followed the introduction of landlocked salmon fry in the Rangeley and other Maine lakes, matured fish now weighing from eight to twelve pounds being fairly abundant. Those fry were properly planted in waters suited to their requirements, and I have no reason to doubt that if salmon fry are taken from the hatcheries and deposited in waters such as are natural to them, they would thrive equally as well as if they were hatched therein, and the rivers would be proportionately benefited.

EDWARD A. SAMUELS.

American Fisheries Society.

NEARLY one hundred active members of the American Fisheries Society attended the thirty-third annual meeting at Atlantic City last week, and nearly as many applications for active membership were received. The Pennsylvania and Michigan Commissions joined in a body. Altogether it was a most useful and aggressive gathering of men and women interested in all things connected with fish life, as the programme promised it would be.

President Frank N. Clark, who is in charge of the United States station in Michigan, in his opening address, sketched briefly the steady progress made by the Society, and urged both State and National Associations to take up work on the problems presented by the pollution of waters and by the feeding of fry. He said that at least two billions of fish fry are now produced annually. The effect of water pollution was discussed offhand, and undoubtedly will be presented further at later meetings. It was apparent that the general impression prevails among both scientific and lay members of the Society that much of the water pollution can be prevented without any great hardship either to manufacturers or to municipalities.

At the afternoon session of the first day, the Society voted to make the annual dues \$2 instead of \$1, and to fix the price of the volume of annual proceedings at 50 cents. The programme committee, of which Mr. J. D. Whish was chairman, reported a very full list of papers for each morning and afternoon session, which moved United States Commissioner Bowers to remark that evidently one of the best meetings yet held was at hand. By request, Secretary George F. Peabody opened the session with a tribute to General E. E. Bryant, whose death deprived the Society of one of its most genial and popular members. Instructive papers were then read by Dr. Tarleton H. Bean on "The Fish and Game Department of the St. Louis Exposition," by Mr. E. N. Carter, of Vermont, on "Methods of Collecting Sturgeon Eggs," by Dr. James A. Henshall, of Montana, on "Further Experiments in Feeding Fry," and by Mr. W. E. Meehan, President of the Pennsylvania Commission, on "A Year's Work of the Fisheries Interests in Pennsylvania."

Dr. Bean gave a highly instructive account of the important work at the Exposition in his charge, and presented the difficult problems he had met and overcome. Mr. Carter's paper led to a general discussion of the subject of sturgeon culture, which was led by such veterans as Livingston Stone, of the United States station at Cape Vincent, and President Clarke, of the Society. Dr. Henshall's paper rounded out his report of his studies made at the last session, and led up to the exhibition of a simple automatic feeding machine for fry, which was the invention of Mr. Seymour Bower. Commissioner Meehan in his resume of the work of the Pennsylvania Commission, described the benefits resulting from the organization of his board on a business basis. He also referred to the problem presented by water pollution, and said that the investigations of his Commission had shown beyond a doubt that this evil could be abolished. Efforts to accomplish this desirable result have heretofore been

defeated by industrial establishments, but these have now been shown that no destruction of industries is intended—only that they must not destroy the fisheries. He said that he believed that the matter had been so arranged that mill owners are now ready to help the Commission to remedy existing evils, and that a bill had been prepared to carry out the ideas of the Commission, which he believed would be enacted into a law. Mr. Meehan was especially severe on the carp, which he said had been declared to be an outlaw by the Pennsylvania Legislature. He was convinced that the leading causes of the diminished fish supply were careless fishing and the carp. He held that the value of the carp as a food did not begin to balance the harm it does, and he cited one instance where the dissection of a carp had shown nearly three quarts of fish spawn in its stomach.

These various statements led to an equally vigorous discussion which showed that the carp has many advocates, but the consensus of opinion favored the idea that the carp is at best a cheap food for a cheap class of people who need to be taught the merits of better eating as an important element of better citizenship. Concededly, the troubles which have followed the careless planting of carp have taught the fish culturists a lesson, and foreign fishes will be handled much more carefully when they are presented for future introduction in American waters.

Dr. H. M. Smith, of the United States Bureau of Fisheries, opened the second day's session with a lecture on "Japan, the Paramount Fisheries Nation," which was illustrated by lantern slides made from photographs and drawings collected during his long visit to that country, to which he was sent by United States Commissioner Bowers. Dr. Smith had the honor to be the first American to receive such a detail, and was warmly welcomed by the officials of the highly organized bureau of fisheries there. By an unanimous vote, the Society decided to print his lecture in full in its proceedings, including the illustrations, of which those connected with the gold fish culture are the beautifully colored works of native artists. One of the most important features of the lecture was that calling attention to the manner in which almost all forms of marine products are utilized by the Japanese, while in this country so very many forms of fish life are either neglected or wasted. A fitting supplement to the lecture was a paper by Dr. Chas. G. Atkins, of East Portland, Me., on "The Utilization of Neglected Food Fishes." In the course of Dr. Atkins' remarks, many species of fishes now ignored in our markets were discussed. Among these were the dogfish of our coasts and the ling of Lake Erie. Dr. Bean and other experts advocated the merits of a large number of others, and the discussion developed much that was of interest and value, in view of the rapid growth of the demand made on our native waters for food supplies.

A paper on "The Whitefish, Its Propagation and Protection," by S. W. Downing, of Put-in-Bay, Ohio, rounded out the morning session. He stated that while not more than 1 per cent. of the spawn naturally deposited was hatched and lived, fully 80 per cent. of the fry were saved in artificial propagation. He advocated a close season for the whitefish in July and August, and the adoption of a size limit, so that every fish caught shall have had a chance to spawn at least once.

The afternoon session was devoted chiefly to a discussion of the bass, led by such experts as Seymour Bower, Dwight Lydell, Dr. Henshall, and President Clark. The papers read included one on "Bass Propagation" by Mr. Lydell; one on "A Plan for Bass Ponds," by E. N. Lambert; one on "Ponds and Pond Culture for Black Bass," by John L. Leary, of San Marcos, Texas, and one by Samuel Lovejoy, of Georgia (a colored student of fish life), on "What I Have Seen of the Black Bass." During the discussion, Mr. Bower spoke in favor of distributing the bass as fry, beginning when they are ten days old, as they are then easier to handle. Mr. Lydell said that a male bass would care for two broods in one season. President Clark said that he had secured the best results by distributing the bass when thirty to forty days old, when they are about one and one-half inches long, and 250 can be carried in a ten-gallon can on trips ranging from ten to twenty-nine hours. Mr. Lovejoy argued that the best results in feeding bass can be secured by throwing the food forcibly into the waters, and thought that careful feeding would avert cannibalism. This view was endorsed by Mr. Stranahan, who said he believed that the bass would not eat each other to any great extent if heavily fed.

After a short talk on the proper sizes at which fish are called fry and fingerlings, the committee having this subject in hand was given further time. It developed that thus far their plan is, so far as bass culturists are concerned, to call this species "fry" when it first rises, to call it "baby fingerlings" when it is from one and one-quarter to two inches long, and to speak of it as "fingerlings" when the fish are two inches long and upward.

At the Thursday morning session, the Society was treated to an illustrated lecture on "A Western Charr in an Eastern Home," by Dr. F. M. Johnson, of Boston. In his remarks he gave an account of some interesting personal studies of the rainbow trout as an associate of the native brook trout. He advised the use of vermicelli cooked with meat bones as an occasional food when the regulation liver spoils or fails to arrive. His description of his dissection of a diseased brook trout which he found had died of gastro duodenitis led to a most interesting discussion of fish diseases, which was led by Mr. J. D. Whish, secretary of the New York State Commission, and Commissioner Meehan, of Pennsylvania. Dr. Smith was advised that there is a great need of educated men, having the means and inclination to study diseases of fish, and that in no other way can a man achieve more speedily distinction at home and abroad among fish culturists. He offered to examine and study any diseased fish sent to him by a member of the Society. After the meeting he displayed the original drawings and painting from which the illustrations were made for his sumptuous book entitled "Forest, Lake and Stream." Mr. Slade, president of the famous South Side Fisherman's Club, of Long Island, took part in this discussion, and incidentally stated that he did not like the rainbow trout because it does not readily rise to the fly. He also said that he disliked the brown trout which grows so rapidly and devours the brook trout, and mentioned one brown trout caught in his preserve which weighed fifteen pounds. He figured that this fish was at least ten years old, and had eaten at least

five brook trout daily. "This will readily account for a considerable loss of fingerlings," he added.

A very valuable and suggestive paper for fish culturists was read by Mr. S. G. Worth, of Edenton, N. C., entitled, "Comments on the Recent Hatching of Striped Bass, and References to the Possible Hatching of Other Commercial Fishes." He said that he had collected twenty-three gallons of eggs from one fifty-pound fish, and that the eggs averaged 35,000 to the quart. Of these, 69 per cent. were hatched successfully. It was his judgment that the thing to do is to find where such fish naturally spawn, and that then the eggs can be taken and hatched artificially with the greatest success.

Dr. H. F. Moore's paper on "The Progress of Experiments in Sponge Culture," which followed, gave an account of the work that is being done under the direction of the United States Commission, and which has been so successful that one merchant now has planted over 80,000 sponge clippings. These will, in about two years' time, produce sponges ready for market, and it has been found that the artificial growth is cleaner and better in many ways than sponges from natural beds. Mr. John W. Titcomb, of Washington, next gave the Society an account of his recent travels in a paper entitled "Fishery Reminiscences of South America." He was sent to that country by the United States Commission, examined the waters, established a hatchery, and introduced several valuable species of fish in this country.

Mr. A. H. Dinsmore, of East Orland, Me., spoke briefly of "A National Fish Preserve," referring to his experience while collecting the eggs of the black spotted trout in the Yellowstone Park. He agreed to take up this subject at length at the next session. A paper on "The Value of Aquatic Plants in Pond Culture," by C. K. Greene, was favorably discussed by the bass experts. There was also a paper on "Dangers in Shipping Cans," in which Dr. M. C. Marsh, of Washington, detailed the results of experiments made at the Cold Spring Harbor hatchery of the New York State Commission with galvanized iron cans.

Hon. Geo. M. Bowers, U. S. Commissioner of Fisheries, made the closing address congratulating the Society on its progress and referring to the present meeting as one of the most important yet held. The value which he places on these meetings is shown practically by the fact that he arranges for the attendance of all the men in charge of the hatchery system of his bureau, and of the leading scientists in its employ, and encourages them to take part in the programme each year. The Society, as a compliment to Commissioner Bowers, selected as its next meeting place White Sulphur Springs, W. Va. Officers were elected as follows: President, Henry T. Root, of Rhode Island; Vice-President, C. D. Joslin, of Michigan; Recording Secretary, Geo. F. Peabody, of Wisconsin; Corresponding Secretary, Chas. G. Atkins, of Maine; Treasurer, C. W. Willard, of Rhode Island. The executive committee, which is the managing body of the Society, is made up thus: Chairman, W. E. Meehan, of Pennsylvania; John D. Whish, of New York; E. Hart Geer, of Connecticut; Dr. James A. Henshall, of Montana; G. H. Lambson, of California; J. J. Stranahan, of Georgia, and Dr. H. M. Smith, District of Columbia. A committee on foreign relations was appointed with Mr. Atkins as chairman, and J. W. Titcomb, Dr. H. M. Smith, Dr. J. W. Henshall, and Dr. F. N. Johnson as members. This committee is to report annually on the progress of fish cultural work in foreign countries and allied matters.

The Society elected a number of honorary members, including Hon. Victor H. Metcalf, of Washington; Dr. Bruno Hofer, of Munich; Mr. Chas. E. Fryer (Chief Inspector of Fisheries), of London; Dr. J. Lawrence Hamilton, of Brighton, Eng.; the Rt. Hon. Earl of Denbigh, of London; Prof. Matsubara (President of the Imperial Fisheries Institute), of Tokio; Dr. Kishinouye (Chief of the Imperial Fisheries Bureau), of Tokio, and Capt. Jno. L. Young, of Atlantic City. During the days of the meeting the members of the Society enjoyed several trips out to sea to watch the raising of the great nets used in collecting specimens for the St. Louis Exposition.

J. D. W.

The Scarcity of Salmon.

SAGINAW, Mich., July 30.—*Editor Forest and Stream:* The salmon fishing on the Grand Cascapedia this year was a failure. I fished all through the month of June and saved but two salmon, and my friend with me did no better, and it was so all along the river. Some were fortunate enough to get half a dozen fish, but others did not get any. It was the same story, I understand, with all of the rivers that put into the Bay Chaleur, not excepting the Restigouche. The unusual scarcity of fish was the general complaint. Up to my last advices, they did not come in late to any extent.

I believe in 1885 or 1886 the salmon run was a good deal the same as this year, but I am told by Mr. C. B. Barnes, of Boston, that about the 21st of July that year the salmon began coming in in great numbers; and I know that my friend, Robert C. Lowry, fished the fore part of August either that year or the year after, and had the good fortune to take five salmon on the Grand Cascapedia.

Now, what I am getting at is this: I wish every salmon fisherman would give his experience, and I think it would be interesting to have them give their ideas as to the cause of this unusual absence of fish at the time they usually are entering this river. It is rumored that on the south shore of the Bay Chaleur, the fish were plentiful, and I also have heard that fish were very plentiful in the rivers putting into the north shore of the river and Gulf of St. Lawrence.

One theory advanced is that the fish missed their bearings and went into the mouth of the St. Lawrence instead of the Bay Chaleur. But I have seen very little in *FOREST AND STREAM* this year commenting upon this scarcity of salmon, which is my reason for bringing the subject to your attention.

W. B. MERSHON.

A novel effect of stage realism will shortly be introduced at the London Pavilion. It is intended to introduce a "fox" hunt on the stage with a whippet in full cry, an Irish terrier covered with a fox's skin, the effect of a chase being produced by the rolling track and the scenery moving in opposite directions.

Yachting Fixtures for 1904.

Members of race committees, and secretaries, will confer a favor by sending notice of errors or omissions in the following list, and also changes which may be made in the future.

AUGUST.

3. Corinthian, midsummer series, Marblehead.
4. Corinthian, midsummer series, Marblehead.
4. Royal St. Lawrence, Seawanhaka cup match, Lake St. Louis, Canada.
4. Mass. Racing Dory Association, Marblehead.

A Cruise on Long Island Sound.

BY CHARLES N. ROBINSON, HARTFORD, CONN.

EARLY in June—the tenth, to be exact—we cast off the mooring lines of Ramea at Essex and started down the Connecticut River for a cruise up the Sound as far as New Rochelle and back to New London.

Ramea is a sloop rigged centerboard cruiser, and was designed by Mr. C. D. Mower and built by Lawley in 1902. Her dimensions are: Length on waterline, 21ft.; over all, 33ft. 5in.; extreme beam, 8ft. 10in.; draft, 3ft. 6in., and with board down, 6ft. 6in. Besides the centerboard she has a keel 12ft. long and 18in. deep, and we have found that she sails very handily with this alone, which is a great convenience in shoal water work. The ballast is all outside on the keel. A sloop rig on a 21ft. boat is rather a novelty in this jib-and-mainsail age. This rig was adopted because it appeared to be the most efficient, and at the same time the most convenient one that could be handled by two men. The experience of two seasons has shown that it is entirely satisfactory, and may be handled by one man without much trouble. The area of the jib and mainsail is 460 sq. ft., and Ramea will carry this in a 15 to 20 knot breeze. In light airs the sail area may be increased to 530 sq. ft. by setting a club-topsail and jib-topsail, and these sails draw well in close work to windward. When not in use the club-topsail is stowed in either of the long lockers which extend aft from the cabin on each side of the cockpit. The cabin was designed for comfort. The transoms are 6ft. 3in. long and, when extended, 26 in. wide. Aft of the transoms on either side are clothes lockers, while at the forward ends are shelves with lockers underneath opening amidships. On each side under the deck are two lockers with a larger one between in which the bedding is stowed during the day. The galley is entirely under the house, and has good headroom. The stoves and dish lockers are

on the starboard, and the ice-box is on the port side.

We—that is to say, the crew, consisting of the writer and his brother—got up for an early start Wednesday morning, but not a ripple disturbed the glassy surface of the river. It was fine weather for bathing, however, and we were soon overboard in the rather warm water, which at this point, six miles from the mouth of the river, is fresh. Breakfast we took leisurely, and then overhauled the rigging, loosened the mainsail, put the jib up in stops, and generally straightened things out. Still no wind and from the hazy look of things to the southward it seemed probable that we should not have much at any time during the day.

I went ashore and bought some more provisions and got hold of the ice man. With some care in stowing, Ramea's ice-box will hold from 60 to 70 pounds, and this generally lasts five days. The waste water drains into a small tank under the lower shelf and is emptied morning and night, when the cook remembers all his duties. This water is used for washing dishes, etc., although Ramea's water supply is ample, two-thirds of the space under either transom being occupied by a copper tank. The two hold about thirty gallons of water, which is piped forward to a pump in the galley.

A light southerly air came in from the Sound about noon, and we decided to make a start. It came very near being a false one, however, for we were close to a mud

RAMEA.

flat and the strong tide nearly set us on to it. We tacked slowly down against the last of the flood tide and caught the first of the ebb above the Lyme bridge. This was fortunate, as we could never have worked through the draw against the tide. The draw swung open in plenty of time, and we soon left the long bridge behind. In years gone by, when this draw was swung by hand, they were not so prompt in opening, and, if they thought a small boat could take her mast down, they often wouldn't open it at all.

We decided to bring up at the upper anchorage, which is about a quarter of a mile above the steamboat dock at Saybrook Point. And bring up we did, but it was on a mud flat! This flat is a favorite spot of ours to ground on; in fact, we never feel that the season's cruising is complete unless we are hung up here at least once. In order to excuse this annual piece of carelessness we conceived the idea that the flat was encroaching on the channel somewhat each year; an excuse that was quite satisfying until we calculated that it would only be a matter of ten years, more or less, before the mouth of the river would be completely obstructed. The wind was light S.E., and I was letting Ramea run in pretty close to the flat in order to get into slack water, when she came to a gradual stop. The jib had been already taken in, so the tiller was jammed down, and with the mainsail flattened in she swung around broadside to the wind. As the tide was falling, no time was lost in lowering the mainsail and taking an anchor out into deep water. After some good hard hauling, she gradually came off, rather to our surprise, and we soon had everything snug and shipshape for the night.

The writer prefers the upper anchorage at the mouth of the Connecticut because of the better protection it offers, and the fact that it is in comparatively slack water. The bottom—a black mud—is excellent holding ground. An anchorage in about 12ft. of water may be found between the two coal docks and about 300 feet from them. In

order to avoid the mud flat above mentioned, one must not pass north of the line of the second (the northern) coal dock. The principal objection to this anchorage is that it is two miles from the mouth of the river. Small boats may find good anchorage for the night inside the breakwaters, either off the inner end of the western or near the spindle on the inner end of the eastern breakwater, care being taken to keep out of the path of the steamers. There are no buoys in the mouth of the river, though there is considerable shoal water. One would be particularly welcome at the end of the shoal which makes off from the inner lighthouse. A pile was driven there this season by private parties, but evidently in too deep water, as it was hit by a barge and broken off below the water.

Leaving H. to start the dinner, I rowed over to the dock and walked down to Kellogg's store at the Point to get a paper. As soon as the potatoes were boiled, H. warmed up a can of soup, broiled an excellent steak, and we sat down to dinner. Having the table leaves hinged on either side of the centerboard case is a great convenience, as you can put them up in a jiffy and there is your table firm and secure, with no legs to be knocked out by an inadvertent sweep of the foot. Cleaning up after a hearty dinner is not always the pleasantest job in the world, but with plenty of hot water and soap it does not take long, and then one can settle back on the transoms with a well earned sense of satisfaction.

Later in the evening, when I went on deck to see if the anchor was clear and everything snug preparatory to turning in, a heavy fog had settled down. The wind had dropped completely, and the river flowed by like oil. They were ringing a bell on a schooner out in the river, and the deep, hoarse voices of the sirens came in from the Sound.

The fog held on all night, and Thursday morning, after breakfast, was as bad as ever. What wind there was came from the eastward. We rowed ashore after breakfast and walked over the bridge to Fenwick. The big hotel was still closed up tight and looked as gloomy and depressing as a summer hotel always does out of season. When we reached the stone pier the fog began to lift, so we started back. But it soon rolled in again, and we turned to the right on reaching the bridge and went over to the Hartford Y. C. house.

On our way back we stopped on the bridge over the creek which connects the cove with the pond over near the beach to watch a muskrat busily engaged in collecting material for a house. He finally secured a load and started up stream with the tide, disappearing some distance away in the marsh grass. Pretty soon he reappeared and swam back to the bridge, making irregular tacks against the swift current. When he had secured what he wanted, he went home again with his load. Apparently he knew enough not to try to buck the current with a load. In a stream like this there is always an endless procession of minnows. They are caught and swept in by every flood tide, only to be swept out again by the ebb.

The fog persisted, but a nice little breeze had come in from the S.E. As the tide was running in, we made short hitches and hugged the west side of the river, getting out to the end of the breakwaters without any trouble under mainsail and jib. Rounding the red lighthouse close to we squared away for Cornfield Point steering W. by N. We were squarely bucking the ebb tide, and it was forty minutes before the pebbly beach with the dirt bluff behind it appeared out of the mist. Our first landfall lay ahead fair and square. We were not so fortunate, however, with our next point, the spindle on Hens and Chickens. The buoy off Cornfield Point lay far outside of us, but as there is plenty of water inside of it we took our departure from the Point itself. A difference of opinion arose over the amount of nothing from the true course necessary to meet the strong S.E. sweep of the ebb tide setting out of the bay. As a compromise, 1½ points were allowed. It was not enough; three points in a light air would be much better. After twenty minutes' sailing we expected to see the spindle, but it seemed a coy thing, and insisted in remaining hidden in the fog. We did not stop to look for it, but changed our course a couple of points to the north and kept on for the red buoy off Crane's Reef. This did not show up on schedule time, either, and it appeared that it also had been moved away. Then the fog began to burn up and drift away in long streamers. The man at the tiller took a long look in shore, and suddenly exclaimed: "There she bobs." Sure enough, the red buoy lay inside our course a full quarter of a mile, swaying up and down in the strong tide. We soon changed our course for Duck Island breakwater, and anchored well up under it about midafternoon.

While we were stowing the mainsail a tow of coal barges came in from New Haven and anchored between us and the breakwater. They immediately began to swing with the tide and it looked for a few minutes as though we might have to get out of the way in a hurry. We took the chance, however, and they cleared us by less than a hundred feet.

After making everything snug, we rowed over to the beach to the east of Grove Beach for the purpose of "exploring" the Patchogue and Menunketesuck rivers, two

swamp creeks which come together just inside the beach and have a common outlet. At first we tried to get in by following a channel along the shore, but it proved a false lead and landed us on a bar of small pebbles over which the ebb tide was racing. The real channel runs straight out from the shore, almost due south. At low water we found from 2 to 3 feet on the bar, and in the narrow channel further in from 5 to 6 feet, which increased to about 10 feet in the pool at the junction of the two streams. We rowed up the left-hand creek half way to the highway bridge and drifted back with the current. The channel is extremely tortuous, full of eel grass, and not more than a foot or two deep, except at the bends. High and dry on a bar near the bank lay an old 30ft. sloop that had a familiar look, and getting in where we could read her name, found it was Hornet, a craft on which, when youngsters, we had many a sail. An inspection of the right-hand branch showed it to be similar to the left-hand one. Creeks like these, though rather difficult of access even under favorable conditions, are an agreeable change from the crowded harbor, and are especially attractive in the fall when ducks are plentiful.

The character of the day had changed. When the fog lifted it left bright, sunny weather, and a nice little breeze, but now the wind had dropped, the sun gone, and the sky had a gray, rainy look.

After dinner we sat in the cockpit awhile and smoked. The men on the tow had gathered around the capstan on one of the barges with their pipes for an after-dinner "gam."

During the night the wind came in from the E., and Ramea, while riding upon her anchor, bumped into the tow as it was swinging around. We jumped out of the cabin half awake, and saw a wall of wood towering above us. For a moment it looked as if a whole island was about to slide over the boat, but a few vigorous shoves sent us clear, and then, as it was a trifle cool for pajamas, we jumped below again.

At five o'clock the next morning the wind was blowing hard from the E., and it seemed best to get under way at once and take advantage of it. We decided, however, to breakfast first, as it was too rough outside to do any cooking under sail. So the cook prepared some coffee and shredded codfish scrambled with eggs on toast. By six o'clock everything was cleaned up, and we put on oilers and went on deck. It had begun to rain, and the wind had increased. So much so, indeed, that after we had put three reefs in the mainsail and bobbed the jib and were all ready to get up the anchor, we found that the strain on the cable was so great that we could not take in an inch, and it was difficult to make it fast again without its getting away.

So we looked at each other and decided to stay where we were—if we could. As luck would have it, the wind was blowing from the very direction in which the Duck Island anchorage has the least protection, and Ramca was putting her bow under almost every minute. The barometer, which had been quite steady until six o'clock, was now dropping rapidly. It was evident that our regular 21-pound anchor, a splendid holder, could not hang on much longer the way things were going, so no time was lost in getting our second anchor, weighing 40 pounds, overboard and coiling the cable up carefully, so that it would run out freely when the smaller anchor started.

[TO BE CONTINUED.]

Interlake Yachting Association Meet

THE annual meeting of the Inter-Lake Yachting Association was held the week of July 17, and proved by long odds to be the most successful ever given by that organization. More than one hundred yachts attended the meet, and it was estimated that five thousand visitors were there to see the races. The meet was held at the usual place—Put-In-Bay, Lake Erie, Ohio—a beautiful spot most suitable for yacht racing. The course is one of the best on fresh water, and spectators can see the entire race from ashore. The accommodations are excellent, and amply sufficient to provide for unlimited numbers. The weather was also desirable, which invariably assists in making an affair of the kind successful. The yachts began to arrive on Saturday, July 16. The first to put in an appearance was the flagship Vanessa, with Commodore John H. Smedley aboard. The I. L. Y. A. comprises the following clubs: Buffalo Y. C., of Buffalo, N. Y.; Erie Y. C., of Erie, Pa.; Cleveland and Lakewood Yacht Clubs, of Cleveland, O.; Sandusky Y. C., of Sandusky, O.; Toledo and Maumee River Y. C.'s, of Toledo, O.; Detroit Y. C., Detroit Boat Club Yachtsmen and Country Club, of Detroit, and the Port Huron Yachting Association, of Port Huron. By noon Monday the entire fleet had assembled in the bay. The bunting, trophies, and medallions to be contested for during the week were on exhibition at the Hotel Victory. Commodore Dexter assisted Commodore Smedley in welcoming the yachtsmen.

Next day (Tuesday) the racing began with class races over a triangular course of 4 miles to the leg. The boys were on hand bright and early, and the weather was all that could be desired. The wind was steady and about 10 miles an hour. The first leg was a close reach, and 40 boats hovered near the line waiting for the gun. The classes were sent away at 5-minute intervals, beginning with the 40ft. class. In the big class the Enright and Sultana had quite an argument in jockeying for a start, in which the former excelled. The 35-footers made a picture with eight or nine boats coming to the line abreast. Cadillac and Echota made a sensational start, and treated the spectators to an exhibition of skill that was little short of marvelous. Echota, however, outjockeyed her rival by securing the windward berth, and hugging it so closely as to force the other to go under her stern. From that time it was nothing but Echota, which was heading straight for the mark, while Cadillac had dropped three-fourths of a mile to leeward at the first turn. Just as Echota prepared to round the mark there was a crash and her big mainsail came down with a run. The throat halliard block had split, and she was out of it from all appearances. Disabled, but not disheartened, the crew set to work to repair the damage, and in 21 minutes the big mainsail was again sent aloft and she started after the fleet with a

jump. The second leg was a reach, one of her strong points, and she rapidly began to overhaul the bunch, finishing just 7m. behind Cadillac, and beating her actual sailing time by 14m. This caused considerable surprise, and boosted her stock to par for the race of the next day. In the 25ft. class, Chloris, a Lakewood Y. C. craft, had things all her own way, winning hands down. The 21ft. restricted class furnished the best racing of the meet. There were five new boats from Detroit and Rooster II. flying the L. Y. C. burgee. Rooster II. had been purchased in Boston, and was looked upon as a likely candidate. She was handicapped, however, by having to sail with only three men, owing to her waterline, which measured exactly 21ft. with the three men aboard. In this class no boat had actually won till they were over the line, so closely were they matched. Spray won out, however in an exciting finish. In the 21ft. regular class, Tattoo, of Sandusky, did the business. Mermaid, of Detroit, won in the 18ft. class. She was protested, however, and a remeasurement showed her to be too large for the class, and the race was given to Wrinkle, of Toledo. In the 16ft. class, the Lakewood Y. C. predominated, with a first, second, and third.

Following is the summary:

40ft. Class—Start, 8:30.			
	Finish.		Elapsed.
Czarina, T. Y. C.	11 10 12		2 40 12
Oberon, T. Y. C.	11 25 17		2 55 17
35ft. Class—Start, 8:35.

Myth, L. Y. C.	10 53 00	1 48 00	
Daphne, L. Y. C.	11 05 05	2 00 05	
Truant, L. Y. C.	11 15 00	2 10 00	
Wa. Wa. S. Y. C.	11 19 20	2 14 20	
*Disqualified.			

Wednesday, July 20—Weather still favorable, though slightly fresher than on the preceding day. Course 5 miles to windward and return. The big fellows again fought hard for supremacy, and the better positions at the start. Sultana gained a point on Enright, getting over first, which made things even. The start, as on the previous day, was at 8:30 A. M., and every 5 minutes a class was sent away. Czarina and Oberon made a pretty race on the first leg, but after that it was all Czarina. Merle kept going, and passed Oberon on the last leg, securing second place.

Enright won in the 35ft. class, and just at the first turn Echota's mainsail dropped with a bang, and the unlucky 30-footer was again disabled. It was a remarkable coincidence that the accident to the boat occurred in the same spot, namely, at the throat halliard block, though on the second day it was the steel bridle that held the block. The most astounding part of it all was her position in the race was identical on both days, and the accident happened within a boat's length of the mark on both occasions. No attempt was made to repair the damage this time, and her skipper ran her back to the bay under jib. In the 25ft. class Chloris had a sail over, while Tattoo won in the 21ft. regular class. In the 21ft. restricted class, Spray succeeded in getting over first, with Ste. Claire second. Wrinkle won handily in the 18ft. class, and Daphne won in the 16ft. class. After the race, Myth, protested Truant, and Truant protested Myth in turn, with the result that both were disqualified for fouling.

Following is the summary:

40ft. Class—Start, 8:30.			
	Finish.		Elapsed.
Czarina, T. Y. C.	10 44 31		2 14 31
Merle, B. Y. C.	10 57 47		3 27 47
Oberon, T. Y. C.	10 58 50		2 28 50
35ft. Class—Start, 8:35.			
Enright, T. Y. C.	11 02 24		2 27 24
Sultana, D. B. Y. C.	11 04 37		2 29 37
30ft. Class—Start, 8:40.			
Cadillac, D. Y. C.	10 42 23		2 02 23
Echota, L. Y. C.	Disqualified.		
25ft. Class—Start, 8:45.			
Chloris, L. Y. C.	10 54 47		2 09 47
Old 21ft. Class—Start, 8:50.			
Tattoo, S. Y. C.	11 02 28		2 12 28
Mermaid, D. Y. C.	11 09 19		2 19 19
Finesse, C. C.	11 12 41		2 22 41
Mabel Mac, T. Y. C.	11 23 23		2 33 23
Suzanne, L. Y. C.	11 32 59		2 42 59
Typhoon, T. Y. C.	11 37 56		2 47 56
Restricted 21ft. Class—Start, 8:55.			
Spray, D. Y. C.	10 52 51		1 57 51
Ste. Claire, C. C.	10 54 28		1 59 28
Eyota, D. Y. C.	10 57 43		2 02 43

Lucille, D. Y. C.	11 38 28		2 38 28
Louise, T. Y. C.	Did not start with class.		
16ft. Class—Start, 9:05.			
Daphne, L. Y. C.	10 57 01		1 52 01
*Myth, L. Y. C.	10 57 01½		1 52 01½
*Truant, L. Y. C.	10 57 02		1 52 02
*Fouled.			

In the afternoon the power boat races were held under the direction of Professor Herbert C. Sadler, of the University of Michigan, chair of naval architecture. The H. B. Kitchell, of Put-In-Bay, was the winner in the cabin class by 15s., and Georgia, owned by P. H. Studer, of Detroit, won the open class by 1m. 5s. A small launch, designed by F. S. Nock, and equipped with a De Mooy Bros. 7 horse-power engine, and owned by them, made the best showing of all, though she did not win. She is only

26ft. long, and is an open boat. She had to start against the cabin class, and was only beaten by a single entry, that being a boat twice her size, and of four times her horsepower. The De Mooy launch was allowed only 47s. over a 12-mile course. This is rather hard to understand, but it is one of those incidents that sometimes happen, and while it was certainly unjust, the De Mooy gentlemen submitted to the inevitable with very good grace. However, their boat was the feature of the power boat fleet, and on a test over a measured course made a mile in 4m. 11s.

Thursday morning continued fair weather, velocity about six miles an hour. Squadron sail in the morning with 94 boats in the line-up. As is customary in all squadron sails, the wind petered out, and had it not been for the kindly assistance of those equipped with power, it is safe to assume that many would have missed dinner. In the afternoon the big cruising class raced, and included the following: Vanessa, the flagship, owned by Commodore John H. Smedley; Hussar II., owned by Commodore E. T. Affleck, of Toledo; Wemco II., owned by Commodore C. C. Warren, of Sandusky, and the Minx, owned by Mr. W. W. Murray, of Detroit. The big fellows were handled admirably, but better work was noticeable aboard the Hussar II., and she won out handily. Wemco II. finished second, Vanessa third, Minx fourth.

Following is the summary:

Start, 2:05.			
	Finish.		Elapsed.
Hussar II., Affleck, T. Y. C.	3 52 50		1 47 50
Wemco II., Warren, T. Y. C.	3 56 40		1 51 40
Vanessa, Smedley, D. B. Y. C.	4 09 50		2 04 50
Puritana, Richardson, T. Y. C.	4 17 20		2 12 20
Minx, Murray, D. Y. C.	Did not finish.		

In the evening the Yachtsmen's Ball was held at the Hotel Victory.

Friday, July 22.—A shift in the wind, weather conditions very threatening, velocity of wind from 15 to 20 miles an hour, very puffy. Majority of the fleet carrying tucks in their mainsails. Friday's race was the free for all, with a one-gun start for the fleet. The start was a wonderful one, as many as 40 boats getting over the line in as many seconds. That there were no disasters is remarkable, for that mass of hulls and sails bore down on the mark at terrific speed in the fresh breeze. There were fouls galore, but they occurred in such rapid succession that it was impossible for the regatta committee to get more than a few, so it decided to overlook them all, which was the only just way under the circumstances. Cadillac got over the line first, with Chloris second, Spray third, Ste. Claire fourth, Echota fifth, Czarina sixth, Eyota seventh, Merle eighth, and a long list well bunched close astern. The course was triangular 4 miles to the leg, the first leg a reach, second a spinnaker run, the third a dead beat to windward. The first five boats held their positions to the first turn, and were so close that only 35s. separated the first from the fifth in rounding the turn. Echota got her big spinnaker out first, only 23s. being required to do the trick. About half way down this leg, Echota decided to gybe her spinnaker, and in 48s. had it drawing on the other side. The balance of the fleet decided to follow her lead, but all the time Echota was getting away from those astern of her, and overhauling the leaders. In sticking too closely to Cadillac, she made the mistake of overstanding the mark, and when it was sighted both were a mile to windward of it. This proved costly, as the last leg was a beat, and here the two big racers lost heavily. The Spray rounded first, Ste. Claire second, Chloris third, Cadillac fourth, Echota fifth. After rounding the mark, Chloris took a long leg on the port tack, the majority of the fleet going the same way, only making shorter tacks. Cadillac made a long leg on the port tack, but later decided on the short ones. Echota decided to make it in two legs, and went off on a long leg on the starboard tack. A few of the fleet followed her, and were sorry afterward. The wind had flattened and was very fluky. Those who preferred the long port tack got what little breeze there was, while Echota followers ran into a soft spot, where they remained for at least a half hour. It now began to cloud up a bit, and a nasty squall was seen coming on the run, but, strange to say, not a single boat took in a reef. Chloris, away down under the lee of Gibraltar, got it first, right on the quarter and away she went on her beam ends, passing the bunch and romping home a winner. Ste. Claire went over second, with Spray 7s. behind her. The balance of the fleet followed closely astern. Away over by Rattlesnake Island lay Echota and her followers waiting for it to hit. It came too late, and they were hopelessly beaten. It is remarkable that no accidents occurred, as the puffs reached easily fifty miles an hour. Following is the summary:

	Start.	Finish.	Elapsed.	Corrected.
Chloris, L. Y. C.	8 39 20	11 03 52	2 24 52	2 13 28
Wrinkle, T. Y. C.	8 43 33	11 20 36	2 41 36	2 16 38
Tattoo, S. Y. C.	8 39 55	11 16 36	2 37 36	2 18 23
Cadillac, D. Y. C.	8 39 25	11 06 40	2 27 40	2 19 51

A smoker at which prizes were distributed was held at the Hotel Victory in the evening which ended one of the largest and most successful yacht meets ever held on fresh water.

C. W. SCHMIDT, JR.

Brooklyn Y. C.

Club Week, July 23-30.

THE first Club Week of the Brooklyn Y. C. was brought to a successful end on Saturday, July 30, with water sports in the afternoon and a dance in the club house in the evening. On each day, beginning Saturday, July 23, some special form of entertainment was provided which attracted an unusually large gathering of members and guests to the Bensonhurst grounds. A number of squadron runs were held in which non-boat owners were given plenty of chance to sail. Club Week was introduced in place of the annual cruise, which it was considered inadvisable to hold this year.

Marine and Field Club.

Bath Beach, L. I.—Saturday, July 30.

Twenty-four boats started in the annual midsummer regatta of the Marine and Field Club, which was held over courses in Gravesend Bay on the afternoon of Saturday, July 30. The race was also the third of a series of five events to count on the season's championship in the different classes. The winners were Maydic, Bagheera, Lizana, Ogeemah, Beta, Kelpie and Martha M. Sandpiper scored a sailover. A fine breeze from S. by E. blew throughout the contest, holding steady and making good times possible.

The regular association courses were sailed, leaving all marks to port. Classes M and N had a reach to a stake boat off Fort Hamilton, a long port board to the Craven Shoal buoys, another with the wind over the starboard quarter to Sea Gate and a reach with balloons set to Ulmer Park. The first leg was a broad reach in which most of the boats carried spinnakers to port. The other starters sailed the same course, leaving out the journey to Craven Shoal. They had a long leg of windward work from Fort Hamilton to Sea Gate.

Bobtail was disqualified for getting away before the gun for her class. She led Bagheera at the finish by 42s., the exact time she would have had to allow her according to racing measurements. Miss Judy fouled the Fort Hamilton mark on the first round. She completed the course, however, and would have taken second prize on corrected time in Class Q. Maydic sailed a splendid race, and led the entire fleet home. She beat the former Bar Harbor 31-footer, Redwing, by 3m. and 50s. elapsed time, and 54s. corrected time. With the disqualification of Bobtail, Bagheera won from Era by 13s. elapsed time, and 48s. corrected time. Naiad finished ahead of Lizana, but lost the struggle by 1m. and 37s. corrected time. Victories in the other classes were by good margins, except in the case of the catboats, in which Martha M. wrested the laurels from Colleen, which boat finished in the lead by only 1s. corrected time. The summaries follow:

Sloops—Class M—Start, 3:05.			
	Finish.	Elapsed.	Corrected.
Maydic, W. H. Childs.....	4 19 01	1 14 01	1 14 01

Boozie	Did not finish.		

Indian Harbor Y. C. vs. American Y. C.

Milton Point, Long Island Sound.—Friday, July 29.

THREE raceabouts of the Indian Harbor Y. C. and a like number from the American Y. C. met in a team race on Friday, July 29. The Indian Harbor Y. C. won by one point, the score being Indian Harbor Y. C. 11, American Y. C. 10.

The boats representing the Indian Harbor Y. C. were: Maryola, sailed by Messrs. A. & W. Hanan; Tartan, handled by her owner, Mr. A. H. Pirie, and Tomboy, which boat was also handled by her owner, Mr. Harry Maxwell. The particulars of the three American Y. C. boats follow: Hobo, sailed by Mr. Clifford Buckman; Cricket, sailed by Mr. Stuyvesant Wainwright, and The Kid, with Mr. Denny Hare at the stick.

The boats covered a 5/8 mile triangular course twice. The start was made off Scotch Caps buoy. The first leg was a reach, the second a spinnaker run and the third a beat. The boats were started at 1:40, and at that time there was a fresh N.W. wind. Maryola was first away almost on the gun. The Kid second, the rest crossed as follows: Hobo, Tartan, Tomboy and Cricket.

On the close reach to the first mark the boats kept well together, and Maryola was still leading at the first mark. Tartan, however, had worked her way into second place. Tartan moved into first place on the second leg, putting Maryola in second place, while Hobo was third, Cricket was fourth. When the boats hauled on the wind, Tartan and Maryola went off on the port, all the others held starboard tacks. Cricket and The Kid finally went after the two leaders. The Kid did some smart sailing and moved from last into second place, Maryola dropped back to third. At the end of the first round the boats were timed as follows:

Tartan	3 03 05	Tomboy	3 05 33
The Kid	3 03 39	Cricket	3 05 52
Maryola	3 05 23	Hobo	3 07 09

On the first leg of the second round Tartan pulled away from The Kid very fast, and on the run opened up a still greater lead. Hobo passed Tomboy and came up far enough to worry Maryola. Tartan increased her lead on The Kid on the windward leg, and as the skipper of the latter boat saw he could not finish first came about and laid down on Tomboy, which boat was doing better in the freshening breeze and had disposed of Cricket and Hobo. The Kid hung on Tomboy's weather bow, and while these two boats were having a brisk struggle Cricket pulled away and finished second. The Kid finished third and Maryola fourth. The summary, start 1:40:

	Finish.	Elapsed.
Tartan, A. H. Pirie.....	4 19 19	2 39 19
Maryola, C. W. Allen.....	4 31 37	2 51 37
Tomboy, H. L. Maxwell.....	4 31 45	2 51 45
The Kid, Oliver Harriman, Jr.....	4 31 30	2 51 30
Cricket, Howard Willets.....	4 31 23	2 51 23
Hobo, Trenor L. Park.....	4 36 51	2 56 51

The judges were Messrs. Newbury D. Lawton, New York Y. C.; Frank Bowne Jones, Indian Harbor Y. C., and H. De B. Parsons, American Y. C.

The 30-footers, Mimosa and Nike, sailed a match race over an 18-mile course, and Nike won by 3m. 3s. The summary:

Sloops—Class N—Start, 1:55.		
Mimosa, T. L. Park.....	4 56 41	3 01 41
Nike, V. I. Cumnock.....	4 53 38	2 58 38

Indian Harbor Y. C.

Greenwich, Long Island Sound.—Saturday, July 30.

THERE was a good turn out of boats in the Indian Harbor regatta held on Saturday, July 30, but the event was not as successful as it would have been had there been more breeze. The race was to have been started in the morning, but was postponed until 2 P. M. At that time there was a light W.S.W. wind.

The larger boats covered a 12-mile course, the first leg of which was a broad reach, the second a beat and the third a run. This course was to have been covered twice, but the regatta committee felt it advisable to stop the boats at the end of the first round. The schooners were sent away at 2:05. There were two starters, the old Burgess schooner, Quickstep, and the auxiliary, Seneca. The latter won easily. Quickstep also had a match race with the sloop Daphne. The schooner allowed the sloop 6m. 9s., and Daphne won by 5m. 44s.

The two 70-footers, Virginia and Yankee, have recently been put into commission, and they met for the first time this season. The wind was so light that both these boats had difficulty in getting away and they were handicapped. Virginia did not cross until nearly 5m. after Yankee. Yankee led throughout the race and won by 7m. 29s.

Neola, Khama and Aspirant not having competitors in their own classes, were "pitted" against one another in a mixed class. The corrected time could not be figured in this class, as some

of the measurements were not to be had. Sloops and yawls of the 36ft. class were the next to start at 2:15. There were four sloops and two yawls. Mimosa III. won, Spasm was second and Anotok was third. There were only two starters in the 36ft. class, Nike and Nellie. The former won by nearly 7m. As usual, the largest number of starters and the best racing was in the raceabout class. Ten of these boats came to the line and Hobo won by 19s. Rascal II. finished next and Tartan was third. Robin Hood beat Snapper, her only competitor in the 25ft. sloop class, by a good margin. Of the two starters in the Larchmont one-design class, Hourii had the best of it and won by just 2m.

Kenoshi and Shoshone sailed a dead heat in the Indian Harbor one-design class. Wa Wa met defeat for the first time this season. Anawanda was badly left by her competitors. Kenoshi and Shoshone will sail off the tie at an early day. Loto II. had no competitor in the 21ft. class and took a sailover. In the 18ft. sloop class Louise Bell was the only boat to finish.

The regatta committee was made up of Messrs. Frank Bowne Jones, Charles E. Simms, E. S. Wheeler and Thomas J. McCahill. The summary:

Schooners—Handicap Class—Start, 2:05—Course, 12 Miles.		
Quickstep, Edward Shearson.....	5 45 52	3 40 52
Seneca, Roy A. Ramey.....	5 16 44	3 11 44

Match Race—Start, 2:05—Course, 12 Miles.		
Daphne, L. D. Armstrong.....	5 46 17	3 41 17
Quickstep, Edward Shearson.....	5 45 52	3 40 52

Corrected time: Daphne, 3:35:08; Quickstep, 3:40:52.

Sloops—30ft. Class—Start, 2:05—Course, 12 Miles.		
Virginia, W. K. Vanderbilt, Jr.....	4 44 10	2 39 10
Yankee, J. Roger Maxwell.....	4 36 41	2 31 41

Sloops—70ft. Class—Start, 2:05—Course, 12 Miles.		
Neola, Geo. M. Pynchon.....	4 53 14	2 43 16
Aspirant, A. & W. Hanan.....	5 01 39	2 51 39
Khama, Seymour J. Hyde.....	5 10 00	3 00 00

Sloops—36ft. Class—Start, 2:15—Course, 12 Miles.		
Mignon, Joseph Fournier.....	5 09 32	2 54 32
Mimosa III., T. L. Park.....	4 45 08	2 30 08
Spasm, E. D. King.....	4 46 05	2 31 05
Anotok, W. G. Brokaw.....	4 48 29	2 33 29
Sakana, R. S. McCreary.....	4 57 08	2 42 08
Memory, H. M. Raborg.....	4 58 32	2 43 32

Sloops—30ft. Class—Start, 2:15—Course, 12 Miles.		
Nike, V. I. Cumnock.....	4 52 23	2 37 23
Nellie, W. H. Bush.....	4 59 04	2 44 04

Raceabout Class—Start, 2:20—Course, 12 Miles.		
Idler, O'Donnell Iselin.....	6 00 43	3 40 43
Hobo, T. L. Park.....	5 41 05	3 21 05
Rascal II., T. S. Hopkins.....	5 41 24	3 21 24
Jolly Roger, T. B. Biecker.....	5 49 41	3 29 41
Tomboy, H. L. Maxwell.....	5 51 38	3 31 38
Tartan, A. H. Pirie.....	5 41 56	3 21 56
Maryola, C. W. Allen.....	5 55 54	3 35 54
Busy Bee, R. T. Wainwright.....	5 53 39	3 33 39
Cricket, J. M. Willets.....	5 42 47	3 22 47
Rogue, A. B. Alley.....	5 43 45	3 23 45

Sloops—25ft. Class—Start, 2:25.		
Snapper, F. S. Page.....	6 06 41	3 41 41
Robin Hood, George Gartland.....	6 03 20	3 38 20

Larchmont One-Design Class—Start, 2:25.		
Vaquero II., J. M. Marble.....	6 03 00	3 38 00
Hourii, J. H. Esser.....	6 01 00	3 36 00

Indian Harbor Y. C.—One-Design Class—Start, 2:30—Course, 5 Miles.		
Kenoshi, C. D. Mallory.....	5 11 31	2 41 31
Anawanda, E. C. Ray.....	5 24 51	2 54 51
Wa Wa, J. E. Montells.....	5 16 35	2 46 35
Shoshone, G. F. Dominick.....	5 11 31	2 41 31

Sloops—21ft. Class—Start, 2:30—Course, 9 Miles.		
Loto II., F. P. Currier.....	5 03 03	2 33 03

Sloops—18ft. Class—Start, 2:35—Course, 9 Miles.

Colleen, John Wilson.....	Not timed.	
Louie Bell, J. M. Williams.....	5 38 07	3 03 07

Atlantic Y. C.

Sea Gate L. I.—Saturday, July 30.

ONLY three craft started in the last power boat regatta of the Atlantic Y. C., which was held on the afternoon of Saturday, July 30, over the course beginning off Sea Gate, Lower Bay. C. C. Kiot's Standard met and defeated Nat. Herreshoff's new creation, Swift Sure, which came all the way from Bristol, R. I., for the event, while Ving-et-Un, entered by C. N. Hamilton, covered the course alone. The boats competed in two divisions, according to load waterline length, without allowance of any kind. Remarkably good time was made over the course, which extended from the start off Sea Gate up through the Narrows to and around the bell buoy off Robbins Reef Light and return. This distance was covered twice, aggregating 20 nautical miles.

Standard did the course in 56m. and 50s., beating Swift Sure by 2m. and 46s. elapsed time. The average speed of the winner for the whole course was 21.26 knots, or at the rate of 24.2949 statute miles an hour. The Herreshoff boat made 20.135 knots, or 23.155 statute miles. Ving-et-Un did the 20 miles in 57m. and 54s. She averaged 20.725 knots, or 23.836 statute miles. This is an excellent showing. Nat. Herreshoff steered Swift Sure during her maiden effort and expressed the opinion that after the machinery of the craft becomes limbered up with further use she will show improved form. The complete summaries follow:

First Round—10 Miles.			
	Start.	Finish.	Elapsed.
Standard	2 30 15	2 59 07	0 28 52
Swift Sure	2 30 42	3 00 06	0 29 24
Ving-et-Un	2 36 21	3 05 25	0 29 04

Average speed in knots: Standard, 20.75; Swift Sure, 20.37; Ving-et-Un, 20.62.

Second Round—10 Miles.			
	Start.	Finish.	Elapsed.
Standard	2 59 07	3 27 05	0 27 58
Swift Sure	3 00 06	3 30 18	0 30 12
Ving-et-Un	3 05 25	3 34 15	0 28 50

Average speed in knots: Standard, 21.50; Swift Sure, 19.90; Ving-et-Un, 20.83.

Full Course.			
First Division—40 to 60ft. L.W.L.			
Standard	2 30 15	3 27 05	0 56 50
Swift Sure	2 30 42	3 30 18	0 59 36

Second Division—Under 40ft. L.W.L.			
Ving-et-Un	2 36 21	3 34 15	0 57 54

Average speed in knots: Standard, 21.126; Swift Sure, 20.135; Ving-et-Un, 20.725.

Riverton Y. C.

Riverton, Delaware River.—Saturday, July 23.

THE Riverton Y. C. held its fourth race on Saturday, July 23. The wind was light and there were sixteen starters. Sea Gull got the start in her class. Fiona overhauled her on the first leg, which was to windward and continued to increase her lead until she finished a winner by 18m. Sea Gull fouled Carolyn II. and a protest was entered. Pumpkin got the start in her class and held her position throughout the race, but was given a close finish by Tadpole who closed up the gap between them and crossed only 16s. behind. In the one-design fleet, John Reese secured first place at the start, but was overhauled by A. G. Cook on the first leg and was not able to regain his position. Cook finished 13m. ahead of Reese. The summary:

Catboats—Start, 3:05.		
	Finish.	Elapsed.
Fiona, John Perkins.....	6 23 45	3 18 45
Sea Gull, Lee C. Cook.....	6 41 00	3 36 00
Carolyn II., C. C. Rianhard.....	6 45 45	3 40 45

Jib and Mainsail Class—Start, 3:10.		
Pumpkin, J. C. W. Frishmuth, Jr.....	6 52 15	3 42 15
Tadpole, E. W. Crittenden.....	6 52 30	3 42 30

One-Design Fleet—Start, 3:10.		
1 A. G. Cook.....	6 52 45	3 42 45
2 John H. Reese.....	7 05 00	3 55 00
3 Dr. C. S. Mills.....	Withdraw.	
4 H. McI. Biddle.....	Withdraw.	
5 John W. Harmer.....	Withdraw.	
6 E. W. Crittenden.....	Withdraw.	
8 C. M. Biddle.....	Withdraw.	

Mosquito Boats—Start, 3:22.		
14 T. H. Walnut.....	6 53 10	3 42 45
15 E. B. Showell.....	7 00 15	3 38 15
2 C. M. Biddle, Jr.....	Withdraw.	
10 H. H. Cooke.....	Withdraw.	

Beverly Y. C.

Wing's Neck, Buzzard's Bay.—Saturday, July 23.

THE Beverly Y. C. sailed its fourth Corinthian race of the season off the club house on Saturday, July 23. The wind was strong from the N.E. at the start, but backed steadily during the day and gradually decreased in force, so that before the boats finished it was blowing from a little W. of N. This, unfortunately, enabled all the boats to fetch around their courses without tacking. Mr. F. A. Eustis acted as judge.

In the 36ft. class, Young Miss had a close race with Praxilla, finally winning by the small margin of 21s. In the 21ft. restricted class, Quakeress again beat last year's champion, Terrapin. In the new 18ft. one-design class, Margaret, the fourth of the new boats, started for the first time this season. She was doing well until her throat haliard block gave way, and in spite of this accident she finished only 3m. behind the leader, Jap, which defeated the second boat, Hindoo, by only 42s.

The one-design 15-footers, as usual, brought out the largest entry of the day. Eight boats started. Mr. Phillip B. Weld, who sailed for the first time this season, started a lively pace by winning with his Compress, but he had hard work for his victory, for he won by 4s. only. The times in detail are given below:

Buzzard's Bay 30-Footers.	
	Elapsed.
Young Miss, D. L. Whittemore.....	1 29 02
Praxilla, John Parkinson, Jr.....	1 29 23

21ft. Restricted Class.	
Quakeress, W. F. Harrison.....	1 50 00

Lake Yacht Racing Association.

July 23, 25, 26 and 27.

A RACING meet was held at Kingston, Ont., on the above dates, two races being offered for each class. There was a fair entry list, but, as usual, many boats entered failed to start; still the racing was far better than last year, when the regular work of the association was eclipsed by the Canada cup match. Of the two cup boats, Irondequoit is not in commission this year, and Starthcona has nothing to sail against, except older boats built under several different rules.

Kingston is admirably one of the best places on Lake Ontario for a meet, as it possesses all ordinary marine conveniences, besides many attractions of its own. The harbor is really the Canadian or north channel between Wolfe Island and the mainland, about two miles wide abreast of the city; and owing to the slight but steady current the water is always clean and bright, even alongside the docks. The yacht club has a house just east of Macdonald park, the position being quite central, and from the club balcony all races are started and timed. There is but little choice of course, but the one used is excellent, two outlet marks being laid, one east and the other southwest of the club house, so as to make two sides of a triangle. Each leg is 3 miles, the course being sailed outward to each mark, returning to the home buoy directly, as shoal water prevents the use of a course between the outer marks. In almost any wind, however, this gives a fair share of windward work, and also a clear view of the racing from start to finish from the club house.

Saturday, July 23.

Races for the 35, 30 and 20ft. classes were on the card for this day, with an 11 o'clock start. Light E. wind on Friday had freshened during the night, bringing rain, which fell steadily on Saturday morning, and at 10 o'clock the weather was cold, miserable and generally unpromising. Inquiry by wire showed the conditions to be local, and as the official probabilities were hopeful and the barometer high, a general postponement for two hours was ordered. This move was fully justified, for the rain ceased at noon, a slight haze lifted, and a fine afternoon's racing followed with a fresh breeze, steady and true from the E. In the 35ft. class, Chinook had a sailover, owing to the non-arrival of competitors. The 30ft. class was a scratch affair, Neola and Thelma going in at the last moment, Neola being unmeasured. Teresa was disqualified for making fast to a pier after the preparatory gun. The times were:

35ft. Class—Start, 1:00—Course, 24 Miles.		
Chinook	4 38 25	Finish.
30ft. Class—Start, 1:10—Course, 24 Miles.		
Neola	5 18 54	
Teresa	5 24 00	
Thelma	5 30 35	
Kumin	5 36 32	
20ft. Class—Start, 1:20—Course, 12 Miles.		
Whirl	3 13 29	
Chiriya	3 16 15	
Kulota	3 19 20	
Wasp	3 23 18	

A dance was held at the club house in the evening.

Monday, July 25.

The yachts of 40ft. and over sailed as a first class, the only entries being Vreda, Canada and the schooner Clorita. The wind was light to moderate from the S.W. and the weather fine. Canada made a good race with Vreda for a long time, finally losing by less than a minute on corrected time. The 25ft. class numbered ten starters, all good boats; this class is the lineal descendant of the famous old 30ft. corrected length class, and under the present restrictions ought to be permanent and useful. The times were:

First Class—Start, 11:00—Course, 24 Miles.			
	Finish.	Elapsed.	Corrected.
Vreda	3 13 24	4 13 24	4 13 24
Canada	3 20 53	4 20 53	4 14 22
Clorita	Did not finish.		
25ft. Class—Start, 11:10—Course, 12 Miles.			
	Finish.		
Petrel	1 21 20		
Keno	1 26 13		
Verona	1 29 40		
Chitta	1 34 05		
*Kee Lox	1 41 50		
Winona	1 43 00		
Nautilus	1 56 19		
Naomi	1 58 22		
Cock Robin	2 01 55		
Geisha	2 08 35		

*Disqualified for fouling the mark.
A band concert was held in the evening.

Tuesday, July 26.

This was a repetition of Saturday's programme, with a light S.W. wind that improved about noon, but fell later on, making the racing tedious and uninteresting. The times were:

35ft. Class—Start, 11:00—Course, 24 Miles.		
Chinook	4 04 00	Finish.
Vivia	Did not finish.	
30ft. Class—Start, 11:10—Course, 12 Miles.		
Teresa	2 08 00	
Thelma	2 32 00	
Neola	Did not finish.	
20ft. Class—Start, 11:20—Course, 12 Miles.		
Wasp	2 21 45	
Whirl	2 26 27	
Chiriya	2 29 16	
Kulota	2 32 14	
Special 16ft. Class—Start, 2:00—Course, 6 Miles.		
Go	4 24 45	
Freda	4 46 00	

Wednesday, July 27.

The wind still hung in the S.W. and was fresh at the start, falling light in the early afternoon. Vreda and Canada made a close race, while it lasted, but Canada struck a soft spot on the last leg of the course and made a poor finish. The 25-footers sailed their 12 miles with the wind at its best and made fast time. Petrel takes the Walker cup, having won both races of the meet. The times were as follows:

First Class—Start, 11:00.			
	Finish.	Elapsed.	Corrected.
Vreda	2 45 00	3 45 00	3 45 00
Canada	3 07 42	4 07 42	4 01 11
25ft. Class—Start, 11:10.			
	Finish.		
Petrel	12 55 00		
Verona	12 56 15		
Keno	12 56 20		
Kee Lox	12 58 40		
Chitta	1 01 27		
Naomi	1 09 15		
Cock Robin	1 12 22		

The prizes were distributed in the evening with the usual ceremonies, thus ending a very pleasant meet, which was free from the slightest hitch or mishap. Great credit is due to Commodore Burns and the members of the sailing committee of the Kingston Y. C. for their careful and attentive management, and to all the members of the club for their thoughtful, although unostentatious, attention to the visiting yachtsmen. In this respect the club has maintained its reputation, the general verdict being: "We have had a splendid time—but we always have a good time at Kingston." WM. Q. PHILLIPS.

The Collision Between Navahoe and Ingomar

In commenting on the collision between Navahoe and Ingomar at Dover on July 15, the London Field says editorially:

Our report of the Royal Cinque Ports Yacht Club regatta at Dover contains a description of the collision between Ingomar and Navahoe. The sailing committee of the club, at a meeting held on July 18, decided "after very careful consideration," that they "were unanimously of opinion that Navahoe was solely to blame for the collision between that yacht and Ingomar, and the committee were also unanimously of opinion that both at the start and afterward Navahoe was sailed recklessly."

The report of the regatta referred to above is as follows:

July 15.—The opening of the Cinque Ports regatta at Dover this year will be remembered in future seasons by an unfortunate occurrence which took place soon after the start, close to the end of the Admiralty pier. The German yacht Navahoe and the American schooner Ingomar came into collision with tremendous force, but provisionally the accident was not the cause of any personal injury to those on board the vessels. Probably owing to the tide the blow was a glancing one, and the amount of damage slight; this, however, was more due to luck than judgment on the part of the disqualified yacht, for the smallest variation in the circumstances might have resulted in a repetition of the fatal collision between Satanita and Valkyrie on the Clyde in 1895. The American schooner, it appears, was on the starboard tack, and, having sailed on her course as far as the end of the Admiralty pier, had set her mainsail preparatory to making a tack off to seaward in the direction of the Varne. Navahoe was a little ahead, but to leeward, also on the starboard tack. Navahoe then cast round on to the port, a maneuver which, after she had got nicely full, threw her right across Ingomar's bows. Ingomar could not tack to avoid a collision because of the Admiralty pier on her weather, and, it being impossible to bear away and clear Navahoe, she struck the German yawl about the middle of her main boom with her bowsprit, and, as the spar crumpled up, crashed into her. Beyond the loss of her bowsprit (an Oregon spar about 45ft. long and 9in. diameter), Ingomar sustained but little damage; but Navahoe's mainsail was torn, her binnacle smashed, and her rail on the starboard quarter buckled and broken. The disabled yachts both claimed to have been in the right under Y. R. A. rules, and each hoisted a protest flag. After the regatta the committee of the club held an exhaustive inquiry, and decided that Navahoe was solely to blame.

Our contemporary the Yachtsman takes a rather different view of the affair. That paper has the following to say:

The foul which occurred between Ingomar and Navahoe, in Friday's race at Dover, has quite naturally been the cause of a considerable amount of discussion among yachtsmen, which has not by any means been allayed by the decision unanimously arrived at by the sailing committee which considered the cross protests and entirely exonerated Ingomar from blame. Several eye-witnesses concur in their version of what happened, viz., that Navahoe was leading Ingomar by fully two lengths as they reached on starboard tack past the end of the Admiralty pier extension. Navahoe, immediately she was clear of the pier, put her helm down and went about on port tack. With a very strong tide running, her way was checked for a few moments, and Ingomar luffed in between her and the pier, where there was no room for a passage, as Navahoe was full on port tack. The collision was therefore unavoidable. Had Ingomar held on she should have cleared Navahoe.

The question which apparently the committee had to decide was whether Navahoe as leading vessel had the right to go about, or whether Ingomar was right in luffing inside Navahoe and trying to get through where there was no room for a passage. There were several persons assembled on the head of the pier works who were within a few feet of the vessels when they collided. It would be interesting to know if any of these gentlemen were examined; their evidence would be naturally most valuable. The decision, as it now stands, is little less than a slur on the fair sailing of one of our best skippers. There is little doubt that the committee's verdict has not been received with general satisfaction, and there is an undoubted feeling that it is a question that might well come before the Y. R. A.

Seawanhaka Corinthian Y. C.

Oyster Bay, Long Island Sound—Saturday, July 30.

SEVEN of the 15-footers sailed a fine race over a 13½ mile triangular course on Saturday, July 30. Cayenne won, beating Sabrina, the second boat, by the narrow margin of 5s. The summary:

	Start, 3:05.	Finish.	Elapsed.
Cayenne, Colgate Hoyt, Jr.	5 38 30	5 38 30	2 33 30
Sabrina, C. W. Wetmore.	5 38 30	5 38 30	2 33 35
Bairn, W. J. Matteson.	5 41 02	5 41 02	2 36 02
Wee Wee, R. L. Cuthbert.	5 42 03	5 42 03	2 37 03
Imp, F. L. Landon.	5 42 58	5 42 58	2 37 58
Chipmunk, T. S. Young.	5 43 33	5 43 33	2 38 33
Brownie, R. W. Gibson.	5 45 28	5 45 28	2 40 28

Erie Y. C.

July 25.

THE club's race was sailed to-day in a strong N. wind, and good time was made. In the 30ft. class, Una beat Kingfisher. Mingo won from Turtle, Iroquois and Marvel in the 25ft. class, and Flora captured the 18ft. race. The next event will be the club's picnic and a ball on July 30.

CABIA BLANCO.

Harmsworth Cup Race.

THE second annual race for the Harmsworth cup was held on Saturday, July 30. The course was from Ryde to Osborne, 7 7-10 nautical miles. There were six starters.

The first heat was won by Napier II., an English boat; Challenger, the American entry, was second. The times were: Napier II., 24m. 19s.; Challenger, 26m. 3s.

In the second heat Napier II. had a walk over. Her time was 23m. 21s.

The French boat Trefle-a-Quatre had a walk over in the third heat. Her time was slow, 25m. 20s.

Napier II., beat Napier Minor, another English boat, by 19s. in the fourth heat.

In the fifth heat, Napier Minor was raced in place of Napier II., which boat had been damaged. The English boat beat the French production by 1m. 25s.

Challenger, the American boat, was designed by Messrs. Tams, Lemoine & Crane, and entered by Messrs. Smith & Mabley. She was handled in the races by Mr. Clinton H. Crane.

YACHTING NEWS NOTES.

For advertising relating to this department see pages ii and iii.

BEACH HAVEN Y. C. OFFICERS.—At the annual meeting of the Beach Haven Y. C., the following officers were elected: Com., Eben W. Greenough; Vice-Com., John T. Burton; Sec'y, J. T. Fox; Assistant Sec'y, J. G. Downs; Treas., S. R. Cowperthwait; Fleet Surgeon, Joseph S. Neff, M.D.; Chaplain, S. R. Cowperthwait; Trustees, J. T. Burton, John Marshall, J. T. Fox.

THIRTY-FOOTER ASAHI SOLD.—Mr. George D. Widner, of Philadelphia, has purchased the Newport special 30-footer Asahi from Mr. Lloyd Warren. The boat's name has been changed to Eleanor, and she will be raced at Newport.

SCHOONER SHAWONDASEE CHARTERED.—The centerboard auxiliary schooner Shawondasee has been chartered for Mr. James King Clarke, N. Y. Y. C., through the agency of Mr. Thomas A. St. Johnston, to Mr. S. Steinfeld.

NEW YACHT CLUB ORGANIZED.—Some forty men have been enrolled in a new yacht club recently started at Bay Shore, L. I. The name of the club has not been settled upon. A club house will be built on Fire Island Beach to the eastward of Clam Creek. H. M. Brewster was elected commodore. The other officers are: Vice-Com., Harry Raven; Rear-Com., E. S. Robinson; Sec'y, Dr. E. S. Morse; Treas., Josiah Robbins.

COMANCHE LAUNCHED.—There was launched a few days ago at Morris Heights a high speed auto boat, built for Mr. S. H. Vandergrift, of Pittsburg. The boat is 66ft. 6in. over all, 65ft. waterline, and 6ft. breadth. She will be fitted with a 9-cylinder Speedway engine, and the builders guarantee a speed of 30 miles. She was named Comanche. The construction is elaborate, and the boat should be strong and rigid. There are three cockpits, the ones forward and aft being for the owner and guests, while in the center one is placed the engine.

Canoeing.

A. C. A. Membership.

THE following have been proposed for membership to the A. C. A.: H. D. Cochran, New York; F. Paul Keller, New York; L. L. Clayberger, Lumberton, N. J.; Charles F. Carroll, Rochester, N. Y.; Chas. J. A. Wilson, W. Newton, Mass.; Harry G. Holmes, Philadelphia, Pa.; Edwin H. Coane, Jr., Philadelphia, Pa.; William A. Ayen, New York; E. A. Bennett, New York; Edgar Shantz, Rochester, N. Y.; Arthur E. Kelly, Rochester, N. Y.; F. M. Bryant, Watertown, N. Y.; E. L. Stevens, New York; James T. Ellett, Tompkinsville, N. Y.; C. P. Latting, Jr., New York; Alfred F. Lutze, Trenton, N. J.; E. J. Wright, New York; C. T. Hildebrecht, Trenton, N. J.; Frederic Andreas, New York; C. Fred. Speidel, Brooklyn, N. Y.; Edward A. Stahlbrodt, Jr., Rochester, N. Y.; Thomas I. Taylor, Brookline, Mass.

The Year Book for 1904.

To the Members of the American Canoe Association:

GENTLEMEN—Despite my great efforts to have the Year Book as nearly correct as possible, several mistakes have crept in, and I wish to acknowledge them at this time, although I may not have as yet come across all of them.

The most serious was the omission entirely of the name of Mrs. J. E. Plummer from the Associate List, as she was elected at the executive meeting last fall, and has long been one of our most enthusiastic members and regular campers. Her number is 164.

In Atlantic Division List, the initials "E. W." were omitted from Mr. Tanner's name. G. L. Hammersley should be T. L. On the illustration opposite page 30, the photo was by W. C. Jupp instead of Tupp.

In Central Division List, Newell C. Fulton's number should be 4,805, as No. 4,790 belongs to George Buchanan, of Brockville, Ont.

In Associate List, Mrs. C. M. Greswell's number should be 170. Mrs. C. Bower Vaux should read Mrs. C. Bowyer Vaux. There are no doubt other mistakes, and as they are found I shall be pleased to publish them.

Since the 1903 Year Book was published, the following ladies have been elected to Associate Membership in the A. C. A., some at the executive meeting in October, and some by mail vote since that time:

- 162 Mrs. Bertha K. Armstrong, Rome, N. Y.
- 163 Miss Frances Armstrong, Rome, N. Y.
- 164 Mrs. J. E. Plummer, Brooklyn, N. Y.
- 165 Mrs. F. W. Donnelly, Trenton, N. J.
- 166 Mrs. Charles H. Parson, New York.
- 167 Miss Dorothea Reichert, New York.
- 168 Mrs. Florence W. Crosby, Woburn, Mass.
- 169 Mrs. Charles P. Forbush, Buffalo, N. Y.
- 170 Mrs. C. M. Greswell, Alveston Grange, England.

Rifle Range and Gallery.

The Bisley Meeting.

THOUGH this year's rifle meeting is not characterized by an important international contest, there are, none the less, a large number of matters meriting attention from the careful observer. Chief among these is probably the contest between automatic arms, not so much because these impart any really novel information, but on account of the curious attitude which is adopted by the onlooker. In fact, it seems to be the general opinion that the automatic rifle is a cumbersome piece of mechanism which offers no advantage in point of speed over the ordinary magazine rifle. Two types of weapon have been submitted to daily tests, but we are not so much interested in their individual peculiarities as in the new principle of armament, which is thus brought so prominently to our notice. The average spectator lays a good deal of stress upon the fact that minor casualties have already occurred, also that, in the case of one of the rifles under test, the ejected cartridge frequently shows signs of having parted with a portion of metal at the mouth. It is, however, on the question of rapidity of firing that the bulk of the comment is centered. In so far that we all know the great rapidity of fire of an ordinary magazine rifle, it was only to be expected that those who imagined the automatic rifle would act like a Maxim gun would be disappointed. The firing trial for rapidity is a mixed test for accuracy and rate of firing, and it is a personal question with the shooter how much time he shall devote to aiming. The fact that the rate of shooting has been at times no quicker than with an ordinary magazine rifle is considered a proof that the automatic mechanism offers no material advantages.

It would appear, however, from a careful consideration of the functions of a military arm, that the test showing how many shots can be fired in a minute is of secondary importance to the rapidity and accuracy with which the supply of ammunition in the magazine can be utilized. Those who have given us the benefit of practical experience in the recent war have all agreed that the modern method of attack is to draw closely to the enemy, taking advantage of every available piece of cover, and then to rush the position, trusting that a headlong charge will minimize the risks of such open exposure. As a weapon, either of defense on the part of those holding the position rushed, or of attack by those who, having rushed the position, are desirous of shooting down the fleeing enemy, the automatic rifle appears to have substantial advantages. If, for instance, the new

type of weapon were tested against the ordinary magazine rifle at the running man range at Bisley, there is no doubt that the automatic system would prove incontestably superior for firing a maximum of well-aimed shots during the transit of the running man across the open space in front of the shooter. That is to say, when the weapon is once charged, the whole of the time occupied between the shots may be spent in undisturbed concentration on the process of aiming, whereas with a magazine rifle, even of the straight-pull type, there is of necessity a delay and disturbance of aim incidental to the process of operating the magazine after each shot is fired. The fact that the magazine of an automatic weapon can prima facie be recharged at least as rapidly as that of a modern military rifle affords a thorough justification for the automatic system as soon as the design of these weapons can be brought to a state of mechanical fitness. At the present time of writing, it is exceedingly difficult to give an adequate forecast of the results to be obtained with weapons under trial at this year's Bisley. It is, however, quite reasonable to infer, from the success which has attended the application of the automatic system to the pistol, the small-bore rifle, and the shotgun, that it is only a matter of time before the automatic rifle will be so perfected in design as to assume the rank of a practical military weapon.

On the subject of the strength of the breech mechanism of the service rifle it is very difficult to pass a satisfactory opinion. A curious illustration of its tenacity is, however, provided by an extraordinary practice which has grown up, so far as we know, quite recently. Added to the paraphernalia of the expert rifle shot is now an inkpot of the kind which may be upset without spilling the contents. This contains a small quantity of Rangoon oil, and the shooter religiously dips the point of the bullet into the oil preparatory to loading it into the chamber. The opinion is firmly held that oil has the virtue of minimizing the amount of cupro-nickel deposited in the barrel. We should hardly like to confirm the efficacy of this remedy; but rifle shooters affirm from practical experience that a definite improvement results from its use. Our reason, however, for drawing attention to this practice is that it of necessity causes a greatly increased strain on the bolt of the rifle. The passing of an oiled cartridge into the chamber necessarily implies the deposit of a certain number of drops on the walls. Practical experiments which have been conducted with pressure guns which measure the pressure of the base of the cartridge on the face of the breech have shown that the base pressure exerted by an oiled cartridge is frequently as much as three times as great as with a dry cartridge. The oiling of the chamber causes the cartridge to act in the manner of a piston, whereby the whole force of the gases on the base is transmitted to the face of the breech. On the other hand, when a dry cartridge is used, its expansion causes it to grip the walls of the chamber in such a way as to minimize the strain on the bolt. If, therefore, the Palma cartridge may be used without mishap in an oiled condition during the hot weather that has been experienced at Bisley, it really seems as though the service rifle, in spite of its obviously bad design, is capable of dealing with a considerable stress.

Shooting at the revolver ranges has proceeded actively since the opening of the meeting. While the number of shooters who have attained the requisite amount of skill to compete in these events is necessarily limited, those who are capable of making the highest possible score have been hard at work endeavoring to produce the needful result at an expenditure in entry fees smaller than the resulting prize. Roughly speaking, a highest possible score may be worth anything in the region of a sovereign. Hence a shooter who endeavors to make ends meet must be capable of getting all his shots on the 2in. bull at 200yds. in the course of, say, six attempts. The fact that one so seldom sees bad shooting at the revolver ranges must be ascribed to the fact that the luck of the novice is of but little avail against the practiced skill of the experienced performer. At the 100yds. range, on the other hand, there seem to be a large number of shooters of local reputation who feel convinced that, if they can only hit off that happy combination of good light, steady nerves, and general well-being, a very high score may be made which will insure a position in the final prize list. The Martin-Smith competition is yearly becoming of less and less interest. The conditions permit the use of rifles of unlimited cost, and ammunition in which everything is calculated to produce the highest degree of accuracy. It is, therefore, by no means surprising that highest possible scores are so easily accomplished. That a seven-shot competition is not a sufficient test for a modern sporting rifle of the highest quality throughout may be shown by the fact that, while the meeting was still very young, a score but one point from the possible was made under similar conditions of shooting in the Stevens rifle competition with rim-fire ammunition. If the popular .25 Stevens cartridge can so readily accomplish the nearly perfect score, a case really seems to be made out for modifying the conditions of the Martin-Smith so as to make its severity proportional to modern development in rifle and ammunition manufacture.

The Greener competition has already been the subject of a good deal of interesting shooting; but unfortunately a difficulty has arisen which has formed the subject of a protest. The conditions under which this event is contested lay down that Greener rifles fitted with Greener sights shall exclusively be used. The interpretation which is generally placed upon these words is that the sights specially made by Mr. Greener for use with this rifle are intended. It seems, however, that a competitor shot with a Greener rifle fitted with a set of match sights of which the cost could hardly have been less than £5. Although it has been argued that these sights confer no special advantage on the shooter, it is clear that on no other grounds would this heavy expense have been incurred. Furthermore, the shooter in question, who won last year's contest with the same sights, this year made a score one point short of the possible very shortly after engaging in the competition. Few things are so distasteful to the rifle shot as a protest against a rival's score; but, on the other hand, every justification seems to exist in the present instance for securing an official definition of the position. Bisley competitions are, as a matter of fact, so arranged that the competitor is either forced to use a strictly standard pattern of weapon or else he is at liberty to adopt every possible means of securing accurate results within certain specifically defined limitations. If, therefore, one shooter spends pounds on entries in endeavoring to make a highest possible score under what is believed to be a fair reading of the conditions, it is doubly distasteful to find in the end that another shooter ties or beats his score by adopting a different reading of the regulations which gives him a definite advantage over his competitors. Good feeling and good sportsmanship alike demand a settlement of moot points of this character early in the meeting.

Another 100yds. contest to which special attention may be drawn is that known as the Adapter. This contest is fired with service rifles and ammunition of reduced charge. The definition is so elastic that it will include the Morris tube cartridge at the one extreme and a cartridge containing a bullet of full service caliber at the other, the sole limitation being one of cost, which presents no special difficulties. The small reduced caliber ammunition is unlikely to stand against the excellent practice cartridges which are known respectively as the Trask and the Gaudet. In both of these a heavy nickel-based bullet is used in combination with a charge of smokeless sporting powder. The Gaudet cartridge is made up from a used Government case, re-sized, re-capped, and then re-loaded as though it were a new cartridge. The metal base enables the bullet to take the sharp spiral of the rifling without leading of the barrel or other difficulties, while the smokeless powder charge effects its propulsion without the undue depositing of fouling which makes black powder so disadvantageous. The Trask cartridge works on generally similar lines, and experiments have, we believe, shown that both brands of ammunition are actually more accurate at 200yds. than the fully charged service cartridge.

We append herewith the winning scores in the leading competitions which were completed up to Thursday night last: Valdegrave.—Match rifle competition, consisting of ten shots at 800 and at 900 yds.; highest possible score, 50 marks at each distance, or 100 for the aggregate; twelve prizes. Last year's winner, Major Oxley, 99. Leading scores:

800 yds.	900 yds.	T'l.	800 yds.	900 yds.	T'l.
Mr E N Wynne.....50	49	99	Mr W Lane Joynst.....48	48	96

Schools Rapid Firing Match.—Service rifle competition; open to teams of eight from various schools; eight shots at 200yds. at the Wantage disappearing target. Highest possible score 64. Won last year by the Repton team with 57 marks. Leading scores: Dulwich 62, Charterhouse 61, Eton 60.

Frankfort Challenge Shield.—Reduced charge competition; open to teams of eight from schools not entering for the Ashburton; seven shots at 25 and 50yds. Highest possible score, 560. Won last year by the Grocers' Company School, 463. Leading scores: Grocers' Company School 477, St. Dunstan's College 454, Sir Roger Manners' Schools 389.

We append a report of the weather during the opening part of the Bisley meeting, which has been kindly supplied to us by Mr. J. H. Steward, optician to the National Rifle Association:

Steward's Tent, July 14, 1904, 6 P. M.—The weather from the 11th to the 14th has been of an anti-cyclonic type. Pressure has been consequently very steady, and the wind light to moderate of the variable fish-tail type so puzzling to marksmen. Sunshine has been intermittent, with very bright intervals, producing changes in light and consequent variations in elevation. The daily range of temperature was as follows: June 11, 16 degrees; 12, 10.5 degrees; 13, 9.5 degrees; 14, 13.6 degrees.—Field (London), July 16.

The Palma Trophy.

ALBANY, N. Y., July 30.—*Editor Forest and Stream:* The strictures on the National Rifle Association, with the incidental severe censure of General Bird W. Spencer, president of the National Rifle Association, made by Mr. Allen Kelly in an article published in *FOREST AND STREAM* of July 30, seem to me to be unjust.

He ignores entirely General Spencer's written assurance that the American team competed according to the conditions of the match for the Palma trophy at Bisley last year, but that the British used rifles which were not of the British service model.

This statement was reiterated by General Spencer, and quite emphatically so, in a letter which was published as part of an editorial in *Shooting and Fishing*, and reprinted in *FOREST AND STREAM* of July 9. I quote from it as follows:

"It is well known that the British shot with a rifle made by a private maker, in no wise a Government contractor, that they were exceedingly fine rifles, and were in no sense a service rifle." (Italics mine.)

That is a serious accusation, which has stood without contradiction. General Spencer is a reputable gentleman, holding a high and important office in military matters, and is entitled to our full confidence. When, as he says, the British team used rifles which "were in no sense a service rifle," why then is it made such a serious matter for the American team, and so unimportant for the British team? Why evade consideration of General Spencer's direct charge against the British team?

Our correspondent seems to have missed understanding that the issue rests on a matter-of-fact, and not on the social or official importance of any one. The conditions governing the pattern of rifles used in the Palma competition read:

"RIFLES.—The national military arm of the country the team represents, being in all respects of the pattern adopted and issued to the troops for service. Rifles of private manufacture may be used, but they must conform to the regulation pattern and bear the official view marks."

While the rifles used by the American team did not meet the conditions, inasmuch as they were of a rifling never approved nor adopted nor issued to the troops, the British rifles used in the match did meet the conditions, inasmuch as they conformed to the regulation pattern. This fact is certified to in the following letter written to the *FOREST AND STREAM* by Lieut.-Col. Crosse, secretary of the British National Rifle Association:

"You ask whether in the competition for the Palma trophy at Bisley last year the British team used special rifles, and if so, whether such special rifles were constructed according to service specifications, and whether they have the regular Government stamp?"

"The rifles used by the British team in the match were, as regards the barrels at all events, of private manufacture. They conformed strictly to the specification for the service rifles. They bore the Government viewer's stamp, as shown at page 98 in the copy of the Bisley programme book of 1903, which I inclose. This mark is a certificate that a rifle has been examined and gauged by an official of the Small Arms Inspection Department, and that it conforms strictly to the service pattern, both as regards the interior of the barrel and in other respects. Such rifles, as you will see by the regulations on page 52, are allowed to be used at Bisley in all competitions open to service rifles, and the rifles used by the British team in the Palma match were in fact used in individual and other service rifle competitions during the meeting."

"I may add that it has for many years been the practice of our National Rifle Association to allow the use of rifles of service pattern, but of private make, in the service rifle competitions at Wimbledon and Bisley."

"C. R. CROSSE, Lieut.-Col., Sec'y."

General Spencer's assertion, then, that the British rifles were "made by a private maker" is true; there is nothing in the rules to forbid this. But his assertion that the rifles were "in no sense a service rifle" is (in the light of Col. Crosse's statement) untrue in its imputation that the rifles did not "conform to the regulation pattern." Taken as a whole, any statement that the British team used rifles which were made by a private maker and were in no wise service rifles must be considered as a half truth of the class which is doubly pernicious because doubly deceptive.

In our consideration of the whole matter, we have proceeded upon the assumption that our readers wanted the facts as they are, without regard to any bearing the facts may have on the persons immediately concerned, whether British or American. We do not believe in the policy of suppression, evasion and misrepresentation which has so

CANOEING AND SPORT

By L. O. ARMSTRONG

Much good sport is to be enjoyed from ocean to ocean in Canada on the great Canadian transcontinental railway which crosses several heights of land. It is well known that small lakes on high elevations are as richly stocked with fish as the mountains are with game. One reason for this is that the settlements and farms are generally found in the valleys.

Taking a map of Canada and traveling from east to west we begin with New Brunswick, with its salmon rivers, its trout streams, its bass lakes, and its great moose hunting grounds. Then we come to Moose Head Lake, in Maine, and Lake Megantic on the international boundary line. Through the eastern townships of Quebec which lie between the Maine boundary and Montreal; along the north shore of the St. Lawrence River from Quebec to the far northern part of Lake Superior, are innumerable streams and lakes and great tracts of forest which are practically in a virgin state. In Quebec there are many clubs and preserves, but in Ontario and the west thereof there are none. The Government, however, protects fish and game, and many people think that the fishing and shooting in Ontario is the best obtainable.

Manitoba has the best duck, goose, and sandhill crane shooting in Canada. There is also moose and elk in the ridges to the north. In addition to all these, there are antelope and mule deer on the slopes of the Rockies in Alberta.

British Columbia and Alaska are known to give the best big-game trophies in America. I have heard of very good shooting to be had on new ground reached from Golden, B. C. I have the permission of the Rev. C. F. Yates, of that place, to use his name as one who is willing to give information to bona fide sportsmen.

I would, however, at this time, complete my notes of the Mississaga canoe trip to bring them up to date, although I have to threaten *FOREST AND STREAM* with another communication before I am through.

THE DESBARATS TERMINAL. MISSISSAGA CANOE TRIP.

In your issue of May 7, I spoke of other terminal points to the Mississaga River trip in Ontario, Canada. I have received many letters from your readers asking for information about these. I send you an account of one of these—an absolutely new canoe trip.

We are told that the world is filling up rapidly, and that the sensations of the explorer and the discoverer are known to but few of the present generation. But not so very far from their own border line American sportsmen can find a wide district that is likely to remain

But at the same time isolation is complete enough, and one may feel all the excitement of penetrating into the unknown, of mapping out new routes, of finding new lakes and streams, of blazing paths through trackless forests, and of being in some instances the very first in the field.

GRACE AND STRENGTH.

There is moose and deer all the way from the main line at Winnebago down to Desbarats. If a man has only a fortnight, let him start at Winnebago and get to Timber Berth No. 195, half way down the Mississaga as quickly as he can. At that point let him leave the Mississaga for the headwaters or mother lakes of the Thessalon and Echo rivers. As soon as he has reached these he is out of the beaten track, and he will follow a canoe route that has not yet been fully traveled by any white

Lake. This lake contains pickerel, and another quarter of a mile brings you to Bocage Lake, which also contains pickerel.

A quarter of a mile to the west of Bocage Lake are some natural caves which are well worth visiting. As you paddle across the lake you can see the entrance to these caves and from the canoe you can make a good photograph of them.

Then three-quarters of a mile, all down hill, lands you into Desbarats Lake, famous not so much for the great number and variety of its fish as for their size. The maskinongé and the doré are caught here. The outlet of this lake makes a pretty rapids, called by the Indians Red Rose Maiden Falls. They have a very pretty legend about them. A two-mile easy paddle down the meandering Desbarats River brings us to Desbarats station, and this is the best terminal of the three routes that can be taken from Winnebago down the Mississaga to the Soo branch of the Canadian Pacific Railway. There is a good village hotel at Desbarats, and a little less than two miles from the station are the Hiawatha Camp Hotels, where the Indian play is given, and where canoes and guides can be obtained, and the news of the world enjoyed. Here the respect for the Indian guide which had developed into almost a sense of personal inferiority as regards yourself, is weakened as you don your good clothes and mix with your fellows. But notwithstanding this transition of feeling, you will entertain a very considerable amount of affection for the same Indian guide, and you will feel like doing something for him, which feeling should not prompt you to spoil him by extravagant gifts, but may generally be satisfied by the gift of your camping clothes, and sometimes a moderate libation by way of rewarding his admirable—if compulsory—sobriety during the trip.

The country we have traversed in imagination is a good moose hunting country—as good as the writer knows. The hunting seems to be better near the settlements than it does a longer distance from them. The moose to a certain extent, and the deer to a larger extent, come to the settlements for protection. The Ontario Government has reserved in this district 3,000 acres of pine land, and the forest guardians are to be game guardians as well. The Government will not rent any of this land for preserving, but keeps it for the enjoyment of all. Land can be bought in fee simple, and that can be preserved. In this respect the policy of the Ontario Government is entirely different from that of the Province of Quebec.

There is a good through express train service to and from both Desbarats and Winnebago. A dining car and

ON DESBARATS RIVER—DESBARATS LAKE IN THE DISTANCE.

LEAVING DESBARATS RAPIDS PORTAGE.

for a long time in its primitive state, owing to the fact that the Ontario Government is now giving a fair amount of protection not only to forests, but also to game and fish. The Canadian waterways, so widely and justly celebrated, are here found at their very best. A broad river flows majestically on its way to unburden itself in the Great Lakes. Once its banks are left, the explorer, who would otherwise have to cut his path through the primeval forest, finds a long series of lakes, each one of which would be valued alone if in some country less bountifully supplied with them, and each one so abounding in fish that to award the palm would be to encounter all the difficulties of Paris.

The hunter of big game who penetrates these pathless wilds must either be a poor shot or very greedy if he does not return satisfied with his performances, and resolved that when the opportunity again presents itself he will return to the scenes of his conquests. Let the American sportsman make one essay for himself. Already some of them know what pleasant places for sport are to be found in Canada, and may be disposed to look favorably upon the claims of northern Ontario, and particularly upon the portion where, so far as is known, sportsmen have not yet traveled, and where only Indians tell of regions still to be located by the white man. While explorations into these Canadian woodlands is no longer dangerous, it has about it just enough adventure to appeal to that feeling in the American which has made him a pioneer in the world's progress. Scarcely anywhere is it needful to be too far from the railway or from some settler's home, to be unable to make a speedy return to civilization whenever such a move is desirable.

man. In fact, it is not yet mapped out. But there is making a map which I have no doubt *FOREST AND STREAM* will furnish to its readers when complete.

This southwestern part of the Mississaga canoe trip is about sixty miles in length. The sixth lake from the Mississaga is the first whose name I know. It is called Carpenter Lake. I met the surveyors who had blocked out these timber berths, and they told me that in three of these townships every stream has brook trout, and in some of the smaller lakes three-pounders were common. It may be necessary in the case of low water to drive by wagon road from Carpenter Lake to Patton Lake near Hoaths. There is a solitary German settler, I am told, away up on Carpenter Lake, and these solitary settlers are blessings. They know the surrounding country, and generally they have bread and potatoes to sell, and occasionally other vegetables. By the time Carpenter Lake is reached the sportsman has generally been long enough without potatoes to appreciate them. From Patton Lake there is a short portage to Island Lake. These two are in the township of McMahon. The drive from Carpenter Lake to Hoaths is through the township of Morin, which lies southwest of 195.

From Island to Heart Lake, through waters teeming with bass and lake trout, we reach at length Lonely Lake.

There is one solitary settler on Lonely Lake—a man called Watson, who is a very decent fellow. His team will drive you to McLean's on Diamond Lake. This lake sometimes has three names given to it, as it is really a chain of three lakes, but I prefer to call it Diamond Lake. At the southernmost point of this lake we find a portage of a quarter of a mile to Gray Duck

sleeping car enable the traveler to thoroughly enjoy his return to civilization, the temporary deprivation from such luxuries rendering them far more welcome than when he has them as a matter of course. If you are going east you can get such a luncheon as you will appreciate; and if west, dinner will be served shortly after you join the train. We have ourselves taken one or two meals in this way, and are quite certain that there was no profit to the railway company out of them.

As to the big game, I have myself seen two moose swim across the mouth of the Desbarats River, and frequently moose are seen in the pastures with the cattle. On my trip from Desbarats Lake to Diamond Lake I saw deer and partridge. Joe Alderson, of Gordon Lake, six miles from Desbarats, says that his party killed two moose on Coffee Creek last fall, and Caribou Jack, a local guide, whose post-office address is Rydal Bank, Ont., knows where there are plenty of moose. In fact, they are increasing in number through the entire region from Winnebago to Desbarats. The building of the railways in the upper Ottawa and in the country east of Desbarats, and the building of the Algoma Central, west of Desbarats, has driven the moose and deer into the unoccupied regions immediately north and northeast of Desbarats, between that station and Winnebago.

It has been arranged to have a carload of the best Oldtown canvas-covered canoes for the Mississaga trip at the disposal of the Canadian Pacific Railway authorities, who will dispose of them at actual cost without charging for freight. They will be at the starting points of the Mississaga trip, at Biscotasing and Winnebago, and some will be found at Desbarats.

WOOD DUCKS

and all the other river ducks which Dame Nature has furnished, will prove rare sport this Autumn to the fortunate men who will lay aside the pen for the paddle.

U. M. C. Shot Shells

in your gun add an element of certainty to each shot. Every shell is waterproofed; each lot of shells are tested for velocity, pattern and striking power before leaving the factory.

GUARANTEE.

Big Game hunters will be glad to learn that U. M. C. Metallic Cartridges are guaranteed as well as the Standard Arms if U. M. C. Cartridges are used as per the new guarantee labels on U. M. C. Cartridge boxes.

WESTERN TRAP.

Charleston Tournament.

CHARLESTON, Ill., July 29.—The two-day shoot of the Charleston, Ill., Gun Club was very successful for the two days, July 27 and 28; yet the storm that struck the city on the first day was so heavy that many departed for their homes. The club have an elegant ground, and the programme and the entertainment were fine. No one could do more than was done for the pleasure of those present.

The traveling men were Chas. Spencer, of St. Louis; Riehl, of Alton, and Standish, of Decatur. Chas. Spencer was high man first day, 169 out of 183, with Frank Riehl and C. B. Wiggins second with 165. Second day Wiggins was high with 175, Riehl second with 170, and Spencer third. Van Gundy and Penn were very close with 167. Scores:

July 27, First Day.

In Other Places.

The Illinois and Indiana circuit of tournaments so far announced are as follows: Litchfield, Ill., Sept. 6 and 7; Chicago Trapshooters' Association, Sept. 9, 10 and 11; Jacksonville, Ill., Sept. 13 and 14; Springfield, Ill., Sept. 15 and 16; Lincoln, Ill., Sept. 20 and 21; Homer, Ill., Sept. 27 and 28; Crawford, Ind., Oct. 4 and 5.

The new club at Washington, Ind., is going in for practice. July 27, nine men were out, viz.: Baldwin scored out of 25 targets 16, Hart 19, Reinsel 12, Valen 10, Read 17, Smith 17, Graham 11, Farris 18, Desjane 10.

The annual tournament of the Quincy, Ill., Gun Club will take place Aug. 17 and 18. This will be an amateur shoot. Quincy has had a "boomer" in Mr. Griffin, and there is much life in the old town in the trapshooting line.

The Doctors' Gun Club held their shoot at Marshall, Tex., July 22, and the Doctors proved a strong combination at the traps. Will Lake, with 23 out of 25, won the hat, while three tied for second place.

At this writing there is uncertainty as to the physical condition of John Boa, the Winchester expert. From Houghton, Mich., comes the information that he was being conveyed to his home in Chicago in care of Fred Foster, having had an attack of appendicitis.

The Mallory boys will bear watching at the Indian shoot, as J. F. made 96.6 per cent. at the practice shoot, July 23. Scores: J. F. Mallory 145 out of 150; S. T. Mallory, 186 out of 200; F. E. Mallory 106 out of 125, Rathborn 103 out of 125, Stewart 161 out of 200.

When Aug. 12 rolls around there will be a tournament at Gunterville, Ala. There will be at least forty shooters. All are invited.

The Dows Gun Club, of Iowa, will hold a tournament, Sept. 28 and 29. Mr. L. M. Howell wishes it understood that the Dows tournaments are among the best ever.

The Birmingham, Ala., tournament has been changed to 16 and 17, which was found necessary not to conflict with the Indian shoot.

The Lincoln, Ill., Gun Club will hold a tournament Sept. 20 and 21. For programmes write Dr. E. P. Lawrence.

The Clipper Club, of Dallas, Tex., now shoot regularly for the medal. Some of their shooters attended the Ennis tournament.

At Sharpville, Ind., the latest thing is a gun club with the significant name of "Never Hit." The officers are: Joseph Renie, President; Ralph Grimes, Vice-President; R. L. Hutto, Secretary. They propose to shoot targets and be sociable.

There was a shooting match at the last meet of the Bay City, Mich., Gun Club. Allen beat out Maxon by one target in 50, viz., 46 to 45, in the first shoot. Then in the second there was a tie on 47. Brougher broke 22 out of 25, Tierney 23, Foueman 21, Flodug 18, Brown 16.

On Sunday last Battle Creek went over to Detroit, Mich., and attempted to beat Detroit at home. Each shooting at 30 targets, Detroit won, with 324 to 312. Scores: Detroit—Morks 46, Renick

49, Triestem 46, Wolf 45, Guthard 45, Tolsma 45, Wood 48. For Battle Creek—Forsyth 47, Hubbard 48, Barnard 37, Howes 44, Hensler 46, Gilkeson 46, Wooden 44; total 312. A fine dinner was provided for the visitors at the Rusch House, and there was a return match set for Battle Creek, Aug. 14.

Dr. and Mrs. Mayo, of De Kalb, Ill., entertained a dozen members of the Sycamore-De Kalb Gun Club, July 26, at their home with dinner. The afternoon was spent at the traps. It is claimed that the new trap kept the scores down to a rather low per cent.

At the regular shoot of the McLean County Gun Club, held at Bloomington, Ill., last Monday, new officers were chosen, viz., C. A. McDermid, President; E. C. Phinney, Vice-President; W. A. Boettger, Secretary; Clark Gideon, Captain; Chas. Bender and James Gray, Directors. New traps will be purchased and hereafter the shoots will be held Wednesday instead of Monday. There will be a distance handicap for the benefit of beginners.

Fort Worth, Tex., reports that on Saturday the meeting at the Park was not well attended, the weather being unsettled, and the scores made were fair when the heavy rain is considered.

Clarksville, Ia., Gun Club will hold a tournament Aug. 24. There will be twelve events, and all the best of Iowa's shots will be invited.

The distance handicap was used at the last shoot at Owensboro, Ky., and showed the wayback men to disadvantage. The committee should not put any one at 22yds., as then they are "out gunned." Evans got 40, Corly 37, Lancaster 36, Lewis 31, Brown 31.

Excursions were run on all the railroads that ran in to Ennis, Tex., July 28 and 29, consequently the tournament was a success. Mr. and Mrs. Sterrett, of Abilene, were present.

The Le Mars, Ia., Gun Club will in the future shoot on every Thursday, instead of Tuesday.

E. Yahr, of Iron Ridge, Wis., has of late quite distinguished himself at the shoots held in Wisconsin and Michigan. His last score was 40 straight, at Pardeeville.

Friday last there was a match at Edwards, Miss., in which the home team split even with the Bolton Club. Bolton won first match, 107 to 94; then Edwards won, 104 to 100. This was good shooting, for Bolton, which club has been organized only a few weeks.

At Winona, Minn., shoots will be held regularly until at least Sept. 1, when the game season will be on. The distance handicap will be used.

The last shoot of the Paducah, Ky., Club was productive of some good shooting. A team match was on, thus: Davis 24, Mercer 19; total 43. Hansboro, 20, Kennedy 39. Davis won the club medal. There is much ado over the coming fall State shoot.

Judge Ballinger, Justice Clark Hall, and City Attorney Thurman, shot a match at Cumberland Park Gun Club, Davenport, Ia., on Sunday. On the first shoot all got the fine score of 2 out of 10. Ballinger then won on the shoot-off. The sheriff thinks there is lots of fun a-brewing.

Rock Valley Gun Club, of Lemont, Ill., did not hold a shoot on last Sunday, for the reason that the weather was too hot.

There is a proposition for a three-man team race at the Rolling Forks, Miss., tournament. There are Vicksburg, Memphis, Greenville, Natchez, etc., to draw from. Entrance \$15, purse 40, 30 and 20. Teams wishing to enter should arrange with J. J. Bradford, of Vicksburg, Tenn.

When the last two days of August roll around all the cracks of Michigan are desired to meet at Traverse City to engage in a shooting tournament.

Jim Head was around Crawfordville last Friday, and got on to a habit that lingered with him all day, as he smashed 125 out of 130 targets shot at. A Jack rabbit shoot held the attention of nineteen shooters.

At Juneau, Wis., a new gun club has been organized. Some of the members are: J. B. Becker, Paul Hemmey, John Bachuber, J. H. Hildemann, F. J. Fennien, P. H. Nelson, G. Weiss, Wm. Schrop, M. L. Lueck, G. W. Thiesen.

And now comes the deponent and says: "One of the biggest and most novel shoots ever held will take place soon at Colorado Springs between John W. Garrett and Joe Rohrer. These worthies propose to each shoot 1,000 targets in a continuous match, which will be as much a test of endurance as of skill."

A new club for target shooting purposes has been organized at Albertville, Ala. J. E. Brown, President; J. W. Walker, Vice-President; T. B. McNonen, Secretary, and Treasurer. The club members propose to shoot in the tournaments held throughout North Alabama.

Hunters in Wisconsin are getting ready for the opening game season on Sept. 1. Fifty thousand license blanks are out.

The last matinee shoot of the Muncie, Ind., Gun Club was well attended. H. A. Shumack, having recovered from sickness, was a pleasant visitor to all present. C. Stearns won on the contest for the shotgun. On the badge A. C. Spencer was high with 22.

Forty farmers of Geneseo, Ill., have banded together and given notice that there must be no Sunday shooting, and in fact, no shooting at any time on their land.

Garfield Gun Club.

Chicago, July 30.—The appended scores were made to-day on our grounds, the occasion being the seventh and last trophy shoot of the second series. The entire club will be reclassified before the next shoot. In to-day's shoot Dr. Meek and Thomas tied for Class A trophy on 23. C. Einfeldt won Class B trophy on 20. Wilson captured the jewelry in Class C on 14.

In the cup shoot, which followed, Dr. Meek won in Class A, Einfeldt in Class B, and Wilson in Class C on 23, 23 and 14 respectively.

In the cup shoot the targets are thrown as 15 singles and 5 pairs.

The day was a trying one for target shooting, there being a strong southwest wind blowing directly across the traps, which caused the targets to soar and dip badly at times. The attendance was not up to our average, only twenty-three shooters showing up for the afternoon, that being our low water mark on attendance for the year so far. Many of our members are now going away on their annual vacations, and we don't expect so large an attendance as we have been having until after the middle of September.

Cup shoot, 15 singles and 5 pairs:

 Shoot-off:
 Mumford Fishing and Shooting Association—Searles 19, Hamblin 19, Johnson 17, Coffin 14, Noyes 20; total 89.
 Boston Athletic Association—Gleason 20, Adams 15, Blinn 16, Owen 17, Moore 16; total 84.

Interstate Tournament at Grand Forks.

GRAND FORKS, N. D., July 29.—The Interstate Association's tournament, held at Grand Forks, N. D., July 27 and 28, was attended by some of the foremost amateur and professional trapshooters in America, and it was a success in every sense of the word.
 Grand Forks is a city of 10,000 inhabitants, located at the junction of the Red Lake River with the Red River of the North. The Red River is a historic stream, as in the days of the fur trading companies it was one of the great highways of the continent, and many a fur-laden craft, propelled by the strong arms of Indian, French and half-breed voyageurs, has been borne upon the bosom of the old river down to Fort Garry, the headquarters of the Hudson's Bay Fur Company.

The Grand Forks Gun Club is a part of the Town and Country Club, and it has splendid grounds just at the city limits. They excel any similar grounds in the Northwest. All the details have been arranged with a view to meet the purposes of the club. The club has a ten years' lease on the grounds. In the center of the grounds is the club house, the building being arranged in the most modern style for the convenience of the members and their friends.

The committee having immediate charge of this particular tournament consisted of Messrs. Clarence A. Hale, W. M. Ferguson, Geo. Duis and A. D. Baughman, and to their untiring efforts the success of the tournament is due.

The programme consisted of nine events each day, eight of which were at 15 targets each and one event of 20 targets, making a total of 140 targets per man. There was also one special event open to manufacturers' agents only. It was at 50 targets, 25 each day, no entrance fee. The prize was a Colt's automatic .32cal. revolver, presented by the Ferguson Sporting Goods Company.

The trade was represented by Messrs. F. H. Lord, B. O. Seymour, L. H. Reid, H. C. Hirschy, C. B. Adams, Hood Waters, C. W. Budd, R. E. Sherer, J. Collins and J. French.

The cashier's office was ably conducted by Mr. H. C. Hirschy, assisted by Mr. B. O. Seymour.

High average among the manufacturers' agents was won by Mr. C. B. Adams, Mr. C. W. Budd, second, and Messrs. Hood Waters and H. C. Hirschy tied for third place.

High average among the amateurs was won by Mr. D. C. Rand, with Mr. F. H. Sprague second and J. H. Stair third.

The special event resulted in a tie between Messrs. Seymour and Budd with a score of 47 out of the 50. In shooting off the tie at 25 targets each, Mr. Seymour broke straight to Mr. Budd's 22, Mr. Seymour being the winner. The scores follow:

July 27, First Day.

Events:	1	2	3	4	5	6	7	8	9	Shot	at.	Broke.

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

COPYRIGHT, 1904, BY FOREST AND STREAM PUBLISHING CO.

TERMS, \$4 A YEAR, 10 CTS. A COPY.
SIX MONTHS, \$2.

NEW YORK, SATURDAY, AUGUST 13, 1904.

VOL. LXIII.—No. 7.
No. 346 BROADWAY, NEW YORK.

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, \$4 per year, \$2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iii.

TROLLEY RIDING.

THE advent of the trolley system as a means of passenger transportation was a public blessing undisguised. Its success has far surpassed the most sanguine expectations of its early advocates. Designed originally to supersede the wretched horse-cars of slow speed and short routes as a means of city transportation, it has eminently demonstrated its fitness for a much broader field of usefulness.

The trolley quickly ousted the horse from city street car traffic, then spread from town to town, till, in the older communities, it is possible from State to State to take pleasant journeys of hundreds of miles by trolley.

This extensive, pervading ramification of trolley lines has multiplied many times the facilities for the transaction of business affairs, besides affording cheap and convenient means of travel to new fields which immeasurably add to the pleasures of the people at large.

As a rule, a ride on the steam cars, so far as it relates to beautiful scenes, is devoid of pleasure. They invariably skirt along the back yards of a city, and aim to take as straight as may be the nearest way to the next town. In pleasing contrast, the trolley journeys through the most beautiful sections of city and country, unfolding an endless panorama of delightful views, alike gratifying to the eye and wholesome to the mind.

In particular is the trolley a blessing to the wage earners of the great cities, the majority of the people. It affords a means of cheap and speedy transportation to country and ocean. One can ride through country roads for hours, with views of green fields, winding brooks, and grand forests, for the outlay of a few pennies.

Every day, but every Saturday and Sunday in particular, during the summer months, the trolley cars transport an innumerable host to the suburban resorts around New York.

To Coney Island alone, the trolley cars, on Sundays and holidays, convey hundreds of thousands of people. There they bathe, sniff the ocean breeze, shoot the chutes, join in the many amusements, and eat, drink, and are merry. After a day of hearty enjoyment they return to the city feeling happier and more content to begin their wage-earning anew than would be possible if they were deprived of such wholesome recreation.

As a means of seeking recreation, the trolley car is the car of the people. Its patrons are the old and young, the rich and poor, the fat and the lean, the washed and the unwashed. Useful in its capacity on ordinary days, it has an elastic capacity on Saturdays and Sundays about New York. A seat built for five will hold six people if they sit properly awry, and then there is room sufficient for seven or eight children in the interstices. The family thus enjoys the outing *en famille*.

The young man who, in the parlor of the man concerning whom he cherishes a hope that he will some day designate him as father-in-law, sits stiffly in amiable imbecility in the presence of the adored one, on the trolley car is transformed into quite a different being. He feels the importance which comes from knightly responsibility. He can take generous initiative in the way of extending tender invitations to partake of the high colored lemonade and toothsome peanut; and the ceaseless solicitude for the loved one's comfort, the thoughtful consideration of her liking in respect to whether she would prefer clam-chowder or fried sausage for dinner, and in return the heartfelt confession that she had the time of her life, do more to establish a *modus vivendi* in one trolley ride than could be accomplished in a thousand stilted, insipid visits, with a thousand remarks on the possibilities of rain.

The elders enjoy the opportunity to confer pleasure on the children, besides enjoying the trolley ride for its own sake. The children, being in that happy stage of life when every thing which is novel is interesting, enjoy all the incidents of the ride whatever they may be.

What is true of New York in respect to suburban places of recreation and amusement, is true relatively of every other city of any importance in America. Each has its trolley lines to convey the city dwellers out into the country, where the birds sing, the sun shines freely, and the flowers bloom. The prices of the trolley ride, a few pennies, are within the means of all. The benefits to be derived from it, in the way of recreation, good fellowship, and healthful diversion, are beyond computation. They are worthy the consideration of those who have never given them much thought.

IN TIBET.

Now that the British invasion of Tibet has been accomplished by the arrival of Gen. McDonald's force at Lahassa, and the British exploitation of the country is to follow, the sportsmen of the world are interested in the game of the new hunting grounds thus opened to them. Tibet, Mongolia, and Central Asia generally, have been visited by but few sportsmen. They are too far off, and too much time and money are required to reach them. Nevertheless they abound in big game of many sorts, some forms of which—in the estimation of many sportsmen—are the most desirable that exist.

Of this game the wild yak is the largest and the most easily obtained. The yak is a black ox-like animal with short, slender horns, short legs, long wavy hair hanging down smoothly; the tail is bushy and reaches to the hocks; and the hair is of such uniform length that it looks almost as if it were trimmed. Among local hunters the yak has the reputation of being dangerous, and it appears that it is a tough beast, which will carry away much lead, unless it is properly placed.

Several species of wild horses and wild asses are found in this region, where they are killed for food. Among these is the Prjevalsky horse, by many believed to be the ancestor of at least one form of the domestic horse. A pair of these are now to be seen in the gardens of the New York Zoological Society. These animals, while often useful for food, will not greatly attract the average sportsman.

Tibet and Central Asia generally are great countries for sheep—the region, it is believed, of the development of this group. Here are found several species of wild sheep—commonly called argali—an improper name applied by the Mongols only to the female animal, the male being called kuldza. Of these, *Ovis poli* is by far the largest, its horns measuring six feet in length, while *Ovis ammon* is smaller, but still superb game. These animals inhabit lofty and more or less level plateaus, like all other sheep taking refuge when alarmed in the higher peaks. They love a rough country. In certain ranges also is found the ibex, still abundant, though shy and hard to reach. The burhel, another form of wild sheep much better known to Indian sportsmen, occurs in Tibet. Here is found also Hodgson's antelope, a beautiful animal with graceful, lyre-shaped horns, which are frequently two feet in length.

A form of red deer not very unlike our wapiti or elk is also abundant in certain sections of eastern Tibet, and enormous quantities of their horns are exported thence to China, for use in preparation of a toilet powder.

The musk deer and various smaller animals are found, but comparatively little is known of the lesser animal life of the region.

On the high barren plateaus in northern Tibet there is a brown bear sometimes growing to very great size—quite as large, and perhaps even larger, than the grizzly of the United States. These bears are greatly feared by the natives, who regard them as very dangerous, and as eaters of human flesh. As a matter of fact, they live chiefly on the marmots which they dig out of the holes they inhabit.

Except, perhaps, the beautiful and graceful snow leopard, there are few cats in Tibet. The country is too high for them, but here occurs the extraordinary bear-like animals known as *Ailuropus melanoleucus*, first described by the missionary Father Armand David, who called it white bear. Very little is yet known about it.

The tall slopes of the Himalayas which border Tibet on the south, have already been much hunted over by British sportsmen from India; and now that the trail into Tibet has become an open one, we may believe that the English will push in there and will have great sport. It is a difficult country to pass through on account of its very

great altitude, which gives it an almost Arctic climate. The distances are still great, and we imagine it will be years before hunters will penetrate very far beyond the Indian border line.

WELD POND AS AN EXAMPLE.

THE very substantial value of good fishing as an asset is well illustrated in the case of Weld Pond, one of Maine's many attractive waters about which gathers every year a colony of summer cottagers. The lake contains pickerel, trout, and landlocked salmon, all in goodly supply. The landlocked salmon were put in about twenty years ago by Commissioner Henry O. Stanley, and have prospered.

The combination of trout and pickerel is unusual; and the presence of the two species in Weld Pond may perhaps be explained by the favorable conditions for trout breeding and growth. The lake is surrounded by high hills and mountains, in which rise trout streams which, after miles of ideal courses, empty into the lake. The trout ascend these streams for spawning, and the small fry do not come down into the lake until they are large enough to take care of themselves against the pickerel. The mountain brooks, too, are closed to fishing under the Maine system which empowers the fish commissioners to forbid fishing in certain waters; and thus there is a constant source of supply for the restocking of the lake, and fishing is always good.

These angling resources have been the direct means of building up a considerable summer population at Weld. There are about the lake some thirty summer cottages, owned either by people in distant cities who occupy them, or by residents of Weld, who lease them to visitors for the season. There are in addition camps and hotels, all growing out of and dependent upon the fishing. Such an influx of outsiders means an enlarged market for the farmer and increased business in various lines of trade. Milk, butter, eggs, and vegetables sell at city prices. The whole community has share in the prosperity growing out of the fishing. Weld Pond is an object lesson, a definite example of the wisdom, from a business point of view, of keeping up the game fish supply.

It is perhaps not unfair to say that the average local paper will chronicle without censure and as a creditable achievement, the taking of excessive bags of game and strings of fish by local sportsmen. Nor is it anything less than fair to credit the local press with a ready willingness to take a stand for moderation in fish and game killing, if only the attention of the editor is called to the subject, and his sympathy is enlisted on the side of reasonable sport. The home paper may be made a most valuable and efficient ally in the cause of game protection. The first concern of a sportsmen's club whose purpose is to enforce the laws and raise the standard of practice in the field, might well be to secure the co-operation of the local press. Most right-thinking men are in a peculiar degree sensitive to the praise or blame of the home paper, whereas they might not care very much what was said in print of their exploits when the criticism did not come so closely home to them. The suggestion made by a correspondent in another column that the local press should be made an ally in the cause of moderate and reasonable, rather than excessive and boastful fishing and shooting, is deserving of general adoption.

THIS is an age of skepticism and unbelief. The squirrel barkers, to be sure, rallied nobly to renew a waning faith in that particular feat of arms; but the insidious questioning of old authorities by Mr. Kelly has had its effect in weakening the confidence with which some other shooting stories are accepted. Now it is the snuffing of a candle. Manhattan marksmen have been trying it, and their verdict is that it cannot be done. We have reason to believe that the inquirer whose note is printed in another column, is sincere in his quest of truth as it pertains to the candle and the candle snuffer.

THAT relation of a meeting with Daniel Boone by Audubon is interesting as a chapter out of the past. It relates to a period when the men who went to the fore made their way there by the exercise of qualities which we admire; and it is refreshing to read this sympathetic and frankly admiring estimate of one fine man by another.

THE SPORTSMAN TOURIST

Summer Memories.

In our childhood, time is regarded as an unending continuation of the seasons; and we follow confidently its slow, measured pace. Not until this gait changes to a run and the past lengthening do we realize that winters, springs, summers and autumns are rolling by like buoyant waves bearing us unresistingly on their calm or stormy crests toward distant lands.

"Whence have sprung the things that are,
And whither roll the passing years;
Where does Time conceal its two heads,
In dense impenetrable gloom,"

quotes Thoreau from the ancient poet Ossian's third Duan of Ca-Lodin; so, no doubt, the onward flow of the universe has not gained nor lost in speed, but moves the same in accord with the individual spirit.

To-day a fire gleams brightly on the hearth, while the elements of winter hold sway outside; to-morrow April buds expand into May blossoms, and this evening summer's smiling radiance greets us in the sunset. Thus once more the portals of a new season are opened, wherein we enter to wander through flowering fields and gardens, perchance finding our way at last to the cool wooded regions that beckon us northward; for in these distant forests the light of a summer sun lingers on rugged tree trunks and throws a soft golden veil over snowy pond-lilies floating on the waters of sylvan lakes.

It is both pleasing and picturesque, when pioneering north on steel rails through our native State, to observe the gradual transition of pastoral scenery into broken, half cultivated country, which gives place to undulating hills and finally the wilderness itself. Here the bones of the "Bark Eaters"—so christened by their brothers living further south—rest peacefully under fragrant leaf mould, guarded by whispering pines that still stand unscarred, and likewise cattle graze in the sheltered meadows of a fertile valley that once was a scene of bloody strife between the latter and white men. But while forests have been almost entirely eaten away in this section, the more mountainous home of the aborigines, although seared by fire and the inroads of civilization, is still able to stimulate the ozone with a pure breath of coniferous woodlands, and offer one retreats of primeval wildness, where vibrations of silence pulsate in the solitude.

The smooth, rounded slopes of the Adirondacks are a distinct pleasure to the eye, for the winds and weather of ages have worn down all jagged peaks that probably at one time existed, and left undulating ranges mounting against the sky in soft harmonious lines. It has often been said that the Rockies are as infants beside these venerable mountains, whose formation shows both volcanic and glacial eras.

Thick timber covering a mountain side sometimes conceals wonderful ledges of rocks, and once a splashing rain brook led us to discover a wealth of geological beauty that was hidden by a luxuriant growth of forest trees. We happened to be lifting a bait trap set on a small bay that was the culmination of an arm or branch of a lake, when the sound of rushing water came to our ears from a steep, virgin-clad mountain rising abruptly on the south side of the pond-like cove. Anxious to know from what source it came, we rowed toward the shore, and found a large rain brook emptying into the lake, running out under a tangle of bushes and ferns, so that at first it was not easy to locate. Far up the mountain side the cool, splashing murmur might be heard, and it tempted us to land for the purpose of further exploration. Pushing aside the thick undergrowth, we beheld a series of cascades and waterfalls leaping down the steep incline, broken, moss-grown boulders forming its bed, and these aided us in our ascent, following one another like rough hewn steps. After a few minutes' scramble, I succeeded in landing on a large flat rock, around which the water foamed and boiled. On the right, reaching up sheer and perpendicular, rose a ledge of huge rocks, adorned with delicate ferns, various tinted mosses and silver lichens, while several birches sprouted from deep crevices. Close beside it a roaring torrent ran the brook, tumbling over roots and stones, sinking into pools and crannies, for falling almost straight down the mountain gave the water a fierce impetus. Encouraged to probe still further the course of this rushing torrent, we worked our way upward, the Veteran making a straight ascent, while Wallace and I struck a deer runway, taking a more roundabout detour in order to avoid treacherous roots undermined with invisible water, which made itself known by soft musical gurglings. Finally, after again crossing the brook, we reached the summit of a cliff, and looking out from this high perch could see the blue lake glinting lazily in the sunshine between the trees, while beyond unbroken forest rolled away to meet the clear, transparent horizon. In stepping near the edge of the rock we discovered a deep, narrow fissure, yawning down fifty feet or more, and undoubtedly it was a relic of a volcanic age, having an appearance as though some convulsive internal forces had split and shoved it outward. But new discoveries awaited us, which we found later on striking back in the woods, where, walking through a sloping fern-grown glen, and sinking deep into the thick, spongy mosses, we came unexpectedly to another mighty ledge of rocks that towered high above us. From its dark, shaded cliff the

cool drip of water could be heard as clear, crystal drops fell on the moist sides to the rocks below.

Looking upward, one was able to discern the outlines of pines and spruces growing from the top of the rocks, and seeming far off against the sky, it must have been that the mountain rose in three great steps, for we could not imagine there was more than one more ledge beyond this. At the foot of the cliff where we stood were strewn enormous boulders and stones, which on closer investigation showed the same pink grain or tint that was apparent on the larger ones. The radiant beams of the sun, striking through the leaves fell on the moist face of the rock wall, making it glisten on surfaces exposed to the light, and appear dank and moist in the shadows.

Only the eye, however, is capable of conveying to one the reality of such a sublime masterpiece, and how many secrets does nature thus obscure? Multitudes that ever will remain wrapped in the unknown, as well as those works of beauty we discover by becoming more intimately acquainted with regions already familiar to us.

Not long since, in reading an eulogy on the Adirondacks, I came to where it stated that these mountains are really an island, being completely surrounded by a chain of waterways. The mountains themselves are a fountain of lakes, streams, and springs, flowing away on every side to replenish others with perennial torrents of pure, living fluid.

Most of the woodland streams, brooks, and occasionally a spring are colored a rich brown-yellow from the muck or forest mould that forms their banks, but as a general rule the lakes are transparently clear, and many of these harbor lusty trout, besides numerous other piscatorial species. It is quite curious that some sheets of water will contain fish of a certain variety, while within a quarter or half mile of it another lake will be absolutely free of them; in one such a thing as a bullhead is unknown, yet but a short distance away there exists a pond literally swarming with these homely horned pouts. The same conditions are repeated in other cases, but there is one fish usually found in all the waters of this region, and that is the speckled trout cherished so fondly by every fisherman.

After a steady downpour of rain lasting five or six hours, small rills and brooks come to life in the woods, seeking out old dried watercourses they previously have flowed through, and perhaps emptying finally with a pleasant trickle into some pond, where trout gather from afar in order to taste the sweet, fresh water. This is a good time to let a bait down between the clusters of lily-pads, and one by one pull in handsome fish that usually make themselves known after a lively manner at the other end of the light rod. Once when we were fishing thus, having already landed nine or ten trout, the grandfather, evidently, of them all came along and deigned to swallow hook and worm at one gulp. It was indeed fortunate that his appetite was primed to commit such a rash act, as it fastened the barb firmly in those hard jaws and held him secure. After keeping down out of sight, fiercely tugging all the while, he made an unexpected appearance on the surface, skipping around among the lily-pads until his orange sides were tightly wound with the long stems that probably proved a decided embarrassment to his breath, for shortly he gave up what otherwise would probably have been a long struggle.

On this same pond, one summer night with a clear, moonless sky, I spent several hours jacking for deer, minus firearms, however, accompanied by another companion and guide. The mild warmth of the evening, and the drone of insect voices suggested the idea that it would probably be a good night for deer to work around the water, and offer us an opportunity of seeing one under a jack light. An old lantern arranged for this purpose was accordingly brought forth, refilled with oil, its dusty glass brightened, and toward eight o'clock we set out, trusting that its light might chance to reveal some night wanderer to our vision.

How still and dark the woods as we enter them and follow the wavering lantern that sheds a mystic, yellow glow on both sides of the narrow pathway. Trees loom up like shadowy spectres, and the moist night odors are strongly pungent in our nostrils, while only the soft, jingling murmur of insects and the quivering peep of a tree toad disturb the silence. It was not long before the pale reflected glimmer of the pond could be seen through the trees, and reaching the shore we quietly turned the boat over, adjusted the light in the bow, and taking our places pushed out on the dark shadowed surface.

A cold, thin fog rolled off the water as the boat moved silently ahead, and we tasted its damp, dew-laden breath, while the zenith was reflected by faint points of light from the stars shining down serenely on the solitude. The crack of a bush all at once broke the stillness, and around went the boat, pointing in the direction from whence the sound issued. A gentle shaking motion in the stern conveyed the meaning to light the jack; a match flared in answer, and then a misty glare of light was turned suddenly on the dark, indistinct shore, illumining trees and rocks with a hazy circle of uncertain radiance. For a second we caught the faint outline of a deer's form, partly shielded by a birch tree, but it was only for a second, and a violent snort, followed by crashing twigs, woke up the surrounding echoes. Again the shrill, frightened whistle rang out, but now further distant, and we could imagine this creature of the forest gazing with

startled eyes into the impenetrable darkness—terrified that the same uncanny light might disclose for a second time his nightly seclusion.

However, only a few minutes passed before a slight splashing noise attracted our attention across the pond; so we stole out from the black shadows and moved over the star-lit expanse of water that intervened. As we drew near, the sound grew more distinct, and we all but held our breaths for fear of disturbing whatever it might chance to be. Expectantly we waited until the jack lit up the shore, but our anticipations suffered a downfall, for there, humped on a slippery log, sat a fat hedgehog, his quills bristling with surprise, and his eyes blinking in the strong light. Amused as well as somewhat disappointed over this apparition, we wreaked our vengeance upon him by a push with the paddle that nearly upset his portly form, causing him to scuttle hastily along the log and disappear with an awkward waddle into the protecting shadows of the woods.

For an hour we floated on the still water, making a complete circuit of the pond, while we watched a luminous star rise over the inky spires of the tree points, seen against the paler sky beyond, but the hollow voice of a barred owl was all that broke the throbbing silence.

The dim spark of the lantern led us to the landing without trouble, and we left hopes of seeing another deer behind with the silent pond. Good fortune, however, had not entirely deserted us, for striking off from the path on our way back, we surprised a buck standing in a patch of briers, and Wallace, who carried the jack light, flashed it upon him before he could move a foot. What a smashing of underbrush followed, as with a springing bound he cleared a fallen tree and fled precipitately away from the penetrating rays that disclosed him running like a phantom through the darkness. Turning around, we headed toward the trail again, and had gone but a few paces when Wallace whisperingly exclaimed, "Just look at those eyes!" and stepping quickly forward, we peered into the black gloom. Seemingly far off in the woods gleamed two bright, glowing coals of fire, and as I looked a pleasant shiver coursed through me at the thought that these burning sparks so intently fixed upon us were the eyes of some large animal. They appeared not unlike a pair of small lanterns shining at a long distance, and here was a delusion, for in reality the deer was quite close by, and as we walked cautiously ahead in order to obtain a better view, they silently went out, no sound betraying where their owner had gone. No doubt we dreamed at night that these fiery eyes belonged to some aborigine chief, whose spirit infested the forests, wandering about and somberly watching over his past home.

Notwithstanding the fact that the Indian dwellers of the Adirondacks have passed away, leaving only picturesque legends and imagination to carry on their career, is it not somewhat of a perennial pleasure to realize that four-footed creatures still exist where the former once pursued them? True, some of these have also gone, but two yet remain for time to obliterate, namely, the Virginia deer and the black bear, for they are the only original varieties of the larger mammals left, although the smaller species of course are apparent in various orders.

It is a good while, therefore, since a panther's scream has started the sleeping wilderness, or sinuous, copper-colored hands have torn the bark from silky birches to kindle a camp-fire, and one holds a sincere faith that likewise many years will have vanished in the past before the laugh of a loon, hooting of an owl, snort of a deer, and the grunt of a bear are hushed in these forest abodes.

CAMILLA.

A Meeting with Boone.

From Audubon's "Ornithological Biographies," 1831-39.

DANIEL BOONE, or as he was usually called in the Western country, Colonel Boone, happened to spend a night with me under the same roof, more than twenty years ago. We had returned from a shooting excursion, in the course of which his extraordinary skill in the management of the rifle had been displayed. On retiring to the room appropriated to that remarkable individual and myself for the night, I felt anxious to know more of his exploits and adventures than I did, and accordingly took the liberty of proposing numerous questions to him. The stature and general appearance of this wanderer of the western forests approached the gigantic. His chest was broad and prominent; his muscular powers displayed themselves in every limb; his countenance gave indication of his great courage, enterprise, and perseverance; and when he spoke, the very motion of his lips brought the impression that whatever he uttered could not be otherwise than strictly true. I undressed, while he merely took off his hunting shirt, and arranged a few folds of blankets on the floor, choosing rather to lie there, as he observed, than on the softest bed. When we had both disposed of ourselves, each after his own fashion, he related to me the following account of his powers of memory, which I lay before you, kind reader, in his own words, hoping that the simplicity of his style may prove interesting to you:

"I was once," said he, "on a hunting expedition on the banks of the Green River, when the lower parts

of this State (Kentucky) were still in the hands of nature, and none but the sons of the soil were looked upon as its lawful proprietors. We Virginians had for some time been waging a war of intrusion upon them, and I, amongst the rest, rambled through the woods in pursuit of their race as I now would follow the tracks of any ravenous animal. The Indians outwitted me one dark night, and I was unexpectedly as suddenly made a prisoner by them. The trick had been managed with great skill; for no sooner had I extinguished the fire of my camp, and laid me down to rest, in full security as I thought, than I felt myself seized by an indistinguishable number of hands, and I was immediately pinioned, as if about to be led to the scaffold for execution. To have attempted to be refractory would have proved useless and dangerous to my life; and I suffered myself to be removed from my camp to theirs, a few miles distant, without uttering even a word of complaint. You are aware, I dare say, that to act in this manner was the best policy, as you understand that, by so doing, I proved to the Indians at once that I was born and bred as fearless of death as any of themselves.

"When we reached the camp, great rejoicings were exhibited. Two squaws and a few papposes appeared particularly delighted at the sight of me, and I was assured, by very unequivocal gestures and words, that, on the morrow, the mortal enemy of the red-skins would cease to live. I never opened my lips, but was busy contriving some scheme which might enable me to give the rascals the slip before dawn. The women immediately fell a-searching about my hunting shirt for whatever they might think valuable, and, fortunately for me, soon found my flask filled with Monongahela (that is, reader, strong whiskey). A terrific grin was exhibited on their murderous countenances, while my heart throbbed with joy at the anticipation of their intoxication. The crew immediately began to beat their bellies and sing, as they passed the bottle from mouth to mouth. How often did I wish the flask ten times its size, and filled with aqua-fortis! I observed that the squaws drank more freely than the warriors, and again my spirits were about to be depressed, when the report of a gun was heard at a distance. The Indians all jumped on their feet. The singing and drinking were both brought to a stand, and I saw, with inexpressible joy, the men walk off to some distance and talk to the squaws. I knew that they were consulting about me, and foresaw that in a few moments the warriors would go to discover the cause of the gun having been fired so near their camp. I expected that the squaws would be left to guard me. Well, sir, it was just so. They returned; the men took up their guns and walked away. The squaws sat down again, and in less than five minutes had my bottle up to their dirty mouths, gurgling down their throats the remains of the whiskey.

"With what pleasure did I see them become more and more drunk, until the liquor took such hold of them that it was quite impossible for these women to be of any service. They tumbled down, rolled about, and began to snore; when I, having no other chance of freeing myself from the cords that fastened me, rolled over and over toward the fire, and, after a short time, burned them asunder. I rose on my feet, stretched my stiffened sinews, snatched up my rifle, and, for once in my life, spared that of Indians. I now recollect how desirous I once or twice felt to lay open the skulls of the wretches with my tomahawk; but when I again thought upon killing beings unprepared and unable to defend themselves, it looked like murder without need, and I gave up the idea.

"But, sir, I felt determined to mark the spot, and walking to a thrifty ash sapling, I cut out of it three large chips, and ran off. I soon reached the river, soon crossed it, and threw myself deep into the canebrakes, imitating the tracks of an Indian with my feet, so that no chance might be left for those from whom I had escaped to overtake me.

"It is now nearly twenty years since this happened, and more than five since I left the whites' settlements, which I might probably never have visited again had I not been called on as a witness in a lawsuit that was pending in Kentucky, and which I really believed would never have been settled had I not come forward and established the beginning of a certain boundary line. This is the story, sir:

"Mr. — moved from Old Virginia into Kentucky, and having a large tract granted to him in the new State, laid claim to a certain parcel of land adjoining Green River, and, as chance would have it, took for one of his corners the very ash tree on which I had made my mark, and finished his survey of some thousands of acres, beginning, as it is expressed in the deed, 'at an ash marked by three distinct notches of the tomahawk of a white man.'

"The tree had grown much, and the bark had covered the marks; but, somehow or other Mr. — heard from some one all that I have already said to you, and thinking that I might remember the spot alluded to in the deed, but which was no longer discoverable, wrote for me to come and try at least to find the place or the tree. His letter mentioned that all my expenses should be paid, and not caring much about once more going back to Kentucky, I started and met Mr. —. After some conversation, the affair with the Indians came to my recollection. I considered for a while, and began to think that after all I could find the very spot, as well as the tree, if it was yet standing.

"Mr. — and I mounted our horses, and off we went to the Green River bottoms. After some difficulties, for you must be aware, sir, that great changes have taken place in these woods, I found at last the spot where I had crossed the river, and, waiting for the moon to rise, made for the course in which I thought the ash tree grew. On approaching the place, I felt as if the Indians were there still, and as if I was still a prisoner among them. Mr. — and I camped near what I conceived the spot, and waited until the return of day.

"At the rising of the sun I was on foot, and, after a good deal of musing, thought that an ash tree then in sight must be the very one on which I had made my mark. I felt as if there could be no doubt of it,

and mentioned my thought to Mr. —. 'Well, Colonel Boone,' said he, 'if you think so it may prove true, but we must have some witnesses; do you stay here about and I will go and bring some of the settlers whom I know.' I agreed. Mr. — trotted off, and I, to pass the time, rambled about to see if a deer was still living in the land. But, ah! sir, what a wonderful difference thirty years makes in the country! Why, at the time when I was caught by the Indians, you would not have walked out in any direction for more than a mile without shooting a buck or a bear. There were then thousands of buffaloes on the hills in Kentucky; the land looked as if it never would become poor; and to hunt in those days was a pleasure indeed. But when I was left to myself on the banks of the Green River, I dare say for the last time in my life, a few signs only of deer were to be seen, and as to a deer itself, I saw none.

"Mr. — returned, accompanied by three gentlemen. They looked upon me as if I had been Washington himself, and walked to the ash tree, which I now call my own, as if in quest of a long-lost treasure. I took an ax from one of them and cut a few chips off the bark. Still no signs were to be seen. So I cut again until I thought it was time to be cautious, and I scraped and worked away with my butcher knife until I did come to where my tomahawk had left an impression in the wood. We now went regularly to work and scraped at the tree with care, until three hacks as plain as any three notches ever were could be seen. Mr. — and the other gentlemen were astonished and, I must allow, I was as much surprised as pleased myself. I made affidavit of this remarkable occurrence in presence of these gentlemen. Mr. — gained his cause. I left Green River forever and came to where we now are; and, sir, I wish you a good night."

I trust, kind reader, that when I again make my appearance with another volume of Ornithological Biography, I shall not have to search in vain for the impression which I have made, but shall have the satisfaction of finding its traces still unobliterated. I now withdraw, and, in the words of the noted wanderer of the Western wilds, "wish you a good night."

A Summer in Newfoundland.—VIII.

(Concluded from page 111.)

EARLY one morning we sat watching on the shore of Fox Pond. Up at the other end a three-year-old stag was busily engaged trampling the bushes as he proudly rubbed a pair of insignificant antlers among the alders. Over in the shallow water a fine adult otter was catching a breakfast of trout; and it was his glossy black pelt and the prospect of securing it that particularly interested me. He was about three hundred yards away, but his every motion was observed through the glass as we lay hidden behind a clump of bushes. A small moving object three hundred yards away makes a very uncertain mark for anyone who is not an expert with the rifle, and I wisely decided to watch and wait, hoping that the otter might decide to take a little excursion in our direction. Jim asked permission to "tole 'im up 'andier," but I had little faith in "tolling" or "bawling," as it is sometimes called in Newfoundland, for only a few days before the guide had tried it on a stag, with a result that the latter quickly departed in the opposite direction, for parts unknown. Whether the otter was fishing or merely enjoying a morning frolic, I could not determine, even by the aid of a glass, for he kept plunging above the surface porpoise-like, often remaining below for two or three minutes. So I finally told my companion to go ahead and venture a "tole" or so for luck; and he replied by uttering a low coughing bark in his throat, something between a grunt and a blat. Never have I witnessed a more successful attempt to decoy an animal. The effect of that single "tole" on the otter was magical; for immediately changing his course, he headed down the pond in our direction, leaving a broad wake of ripples behind.

Nearer and nearer he came, swimming as fast as a fish, his round bullet-like head bobbing from side to side in expectation, his little beady eyes vainly searching the shore. I allowed him to come up within fifty yards, and was just about to press the trigger, when my otter suddenly arched his back and dove beneath the surface. Five minutes later we could just see him away up the pond, making a bee-line for the opposite shore. He outwitted us and escaped, and he is still terrorizing the trout; but after all, perhaps, it is just as well. Ever since the days of the bison we have read and learned of the game that was killed; but some time perhaps a writer will tell us in a book another—a very different tale—a story of the game that got away. In "The Trail of the Sandhill Stag," Mr. Seton strikes a chord which vibrates with no uncertain sound, but the whole story of the game that escaped to live on, is still unwritten, for it would fill a hundred volumes and recall a thousand vivid memories.

A fog on the barrens is just as misleading, just as perplexing to the traveler as a fog on the ocean. Hunting is out of the question, and it is only a rash guide of little experience, who will venture forth when the highlands are shrouded in dense clouds of moisture. The next day was such as one. The surrounding hills were veiled in a thick mantle of mist, which drifted down through trees and shrubbery filling the woods with an all-pervading dampness. So we wisely remained under shelter watching the antics of the jays as they frolicked in and out among the trees.

The northern jay is perhaps the most entertaining of all the little creatures which furtively investigate a camp in the forest. He is a distinguished bird withal, distinguished not only in possessing the friendship of the woodsman, but because he is known by a list of titles far longer than that of his southern cousin or northern neighbor. Only the flicker can boast as many names. But whether moosebird, camp robber or venison hawk, whiskey jock, garbey, or just plain Canada jay, he is without doubt the boldest, most impudent rascal that ever visited a camp. Always restless and busy, in autumn he toils from the early gray of morning until after sundown, constantly working,

hiding away in every conceivable nook and carrying a store of tempting morsels for future needs. On the continent these stores are often rifled by the vituperative red squirrels; but such pesky vermin do not thrive in Newfoundland, and there the jays are at perfect liberty to hide their winter supplies in safety and then to turn about and forget the very places in which they are stored. During our stay at Sand Pond there was hardly an hour of daylight when three or four of the busy fellows were not picking away at our smoked meat; and in their selections of choice tidbits for the future, the birds displayed a truly marvellous degree of prudence and foresight, for they invariably breakfasted upon the tenderest parts of the lean meat, and afterward, when the day's work had commenced, only the fat was carried away—the fat that would keep so long without danger of tainting. Those jays knew a thing or two about housekeeping.

By noon the sun's warmth, added by brisk westerly breezes, wrought havoc among the low-hanging fog banks, sending the clouds scurrying hither and thither, chasing each other across barrens and forests and lakes alike. Their ranks were shattered and broken by the sharp ridges, and here and there a peak higher than its fellows would capture a few which hung like great white birds hovering under the cliffs, as the rest of the flock raced swiftly over the hills to the eastward.

I focused my glass on the highlands back of camp and saw a small herd of deer, five does, and behind them an old stag with inferior antlers slowly bringing up the tail end of the procession. Further up the slope three more does with a single fawn were feeding on the moss, while away across on the opposite ridge another herd appeared like mere specks against the mountain side. Yes, at last the caribou were on the open country. So Jim and I took the big "lead," which led from the pond, and, after an hour of climbing, looked out over a vast expanse of rolling hills and barrens. Twenty or thirty caribou were in sight, but none bearing good antlers, although among them were four or five full sized stags. One of them, a big, heavy fellow, stared defiantly at us as we passed by at a hundred yards. One branch of his antlers was of great size, well pointed, and carried an enormous brow palmation, but the other was so grossly mishapen and deformed as to have lost all semblance to a horn; and that crooked antler proved a very successful talisman, for it saved his life. The stag seemed to be fully aware of it, too, for fully five minutes elapsed before he finally gathered his scattered wits and trotted off after his does. A caribou stag always brings up the tail end of a herd and rarely, if ever, leads the procession. This may be at variance with the experience of other observers, for in "American Animals," Mr. Witmer Stone, in quoting Mr. W. M. J. Long's "Wilderness Ways," says: "The leaders on the barrens are wise old bulls that make no mistakes." Mr. Long's observations at the time were made, I believe, in New Brunswick; but such a statement when applied to the caribou of Newfoundland is incorrect and opposed to the experience of many sportsmen who have hunted on that island.

The runways out on the open barrens seemed to have been much more generally used by the animals than during the previous week, and in each were countless hoof prints of all sizes, "footens," as Jim called them. In one trail he pointed out a new and peculiar track, one now rarely seen in the east, it was the track of a wolf. The eastern wolf is doomed. Slowly retreating from lower Ontario and Quebec, he has already relinquished his old hunting grounds in Maine, New Brunswick and Nova Scotia, and is rapidly vanishing before the vanguard of civilization. In Newfoundland he is rarely if ever seen near the coast, and only infrequently in the wild fastnesses of the interior. And strange, too, is it not, for the wolf is the hardest beast of the forest. Suffering and starvation and endurance are bred in his very blood and bone. He is the most destructive to game, the wariest of traps, the boldest marauder when driven by hunger, and the most difficult to shoot of all game animals, and yet, slowly but surely, in the east at least he is passing along in the trail of the Indian. These two savage races have lost strength in the struggle for existence, the great battle for the balance of power. These wild, free natures, companions in the hunt for centuries past, are now vanishing together.

The air was crisp and cold that afternoon, and many deer were seen roaming about in little herds and companies, but stags carrying really respectable antlers were difficult to find, and it was not until well toward evening that we discovered one worthy of a shot. There were two of them, grand old fellows with snowy necks and broadly palmated antlers. They were standing together, side by side, and seemed fully to enjoy each other's company. How different would be their feelings a few weeks later, after the rutting season had commenced; then it would be head on, horn to horn. It was a long creep up to the edge of that pond, over moss soggy with rain and saturated huckleberry bushes; and the latter, rarely more than a foot high, offered the meagrest cover for a successful stalk. But caribou are far different creatures from white-tailed deer or mountain sheep, and in less than fifteen minutes I had crawled the necessary three or four hundred yards and stopped behind a friendly rock before venturing a shot. They were grand beasts, those stags, now in easy range and in no hurry to escape. So I watched them through the glasses for a moment, trying to choose the better head. The one with numerous but small points on his antlers was lying down chewing the cud, while directly behind him, broadside on, stood his comrade calmly awaiting the arrival of the laden death. In a moment it came, swift and certain, behind the shoulder. The deadly mushroom bullet did its work well, for the powerful beast trotted off a few paces as if unhurt, and then fell in a heap with a deep sobbing cough. The other, jumping to his feet at the report, stood staring and astonished. He waited a moment as if for his dead companion to rise, and then, breaking into that peculiar lope, started off across the barrens toward the highlands. Five minutes later, on the crest of a neighboring ridge, I could see his dark form and great branching antlers silhouetted against the sky as he rushed forward with headlong strides.

The most difficult question to answer ever put to the hunter of big game is this, "And what did you do with the meat?" All through the West an excessively dry climate and the general use of pack horses enable the sportsman to save the best of his venison, even though the latter be that of the largest of bull elk. Throughout the Southern States as well, the very nature of the country and the methods of hunting often permit or even demand the use of horses, but even without them a small southern deer, when properly dressed, is no load for an able bodied man to pack on his shoulders. The same is true in regions where rivers or lakes navigable for canoes form natural waterways, and game may be easily transported. It is unfortunate, however, that throughout so many sections of Canada the carcass of a large animal is of necessity, owing to the topography of the country, left behind almost entire to be wasted. The head-hunter who goes regularly for moose to New Brunswick or Quebec, always well stocked with provisions, is usually compelled to waste all but a very few pounds of the meat. In the former Province I have seen the whitened skeletons of no less than eight bull moose within a radius of five miles, and not one bone was missing save the skulls. That was in the Clearwater country, near the Little Southwest Miramichi, some thirty-five miles from the nearest house, a region devoid of navigable waterways or even fairly respectable tote roads. A carcass as large and bulky as that of a moose cannot be dragged thirty or forty miles to the settlements unless on a hard snow crust; but anyway, a majority of the animals annually killed by sportsmen in eastern Canada are shot during the calling season in the early autumn, when their flesh is often strongly tainted by the rut. Calling a moose to his death, decoying him within range during the mating season, is hardly a method which a sportsman would care to exploit; and although once very popular among hunters, at the present time public sentiment is exerting a powerful influence against such practices. Maine and Ontario have taken the lead by passing legislative enactments which defer the open season on moose until after the rut, and it is to be hoped that soon Quebec, Nova Scotia, and New Brunswick will adopt a similar policy. Probably half the caribou killed in Newfoundland by non-residents, especially where several sportsmen hunt in one party, remain practically untouched save for the heads. Along the larger waterways and at Grand, Terra Nova, and other lakes in close proximity to the railroad, most of the meat may be transported by means of dories, but in a region of small brooks and scattered ponds it cannot be saved unless smoked or salted down. The flesh of a large stag when properly boned and dried loses many pounds in weight and becomes, in such a condition, no more than a good load for a man; or else it may be cached in a small hut, where it will keep indefinitely. There are few natives in the colony who would not be glad of a chance to travel twenty or thirty, or even forty miles over the hard snow crust for a few hundred weight of well preserved venison. During the early autumn of 1901, when hunting with Mr. Nevin Sayre on the north branch of the Terra Nova, Mr. Sayre employed an extra packer solely for the purpose of making three trips back to the railroad, and each time his dory was well freighted with fat quarters. A week later, after leaving the river and traveling some fifteen miles across the barrens to Island Pond, we met an Englishman, whose name is unfortunately forgotten or it would be published in this narrative. By reason of some underhanded juggling or political preferment, this man held two licenses allowing him to shoot six stags. What was done with a ton of good meat may be easily surmised; perhaps he ate it all. European methods of slaughtering game *en masse* have fortunately never found favor in the eyes of American sportsmen, but even in England, where eighty or a hundred brace of pheasants are no unusual bag for a day, or in Germany, where a few dozen wild boars make but a moderate score for the royal party, it is to their credit to say that not a pound of meat is lost, and no wasteful methods are tolerated. The efficient protection which wild game enjoys in many of our States to-day is due primarily to sportsmen's efforts; and during the last few years public sentiment has branded the wasteful destruction of our animals as being totally repugnant to sportsmen's ethics. That old, oft-repeated maxim is still as cogent and powerful as ever, "Anyone can kill game where it is abundant, but it takes a gentleman to know when he has enough."

That evening as we lay upon the fragrant balsam boughs watching the sparks as they soared aloft, a strange fancy suddenly seized the elder of the two men, usually so silent, and for hours I listened to stories of the woods—stories of long ago before the "sporters'" advent in Newfoundland; reminiscences of the bygone days of his boyhood, when, with old Indian Christopher, he trapped beaver in the very pond before us. Those were the times when fur was cheap, and it was a poor winter when they did not bring back a hundred good pelts. He told me tales of the otter and marten and "lucifer," and of the wolves. How one night when snowed in among the Anniepsquolch Mountains the wolves robbed him of his pelts, and how he traveled back home alone and empty-handed, a hundred miles over the frozen wastes; tales of terrible hardship and suffering when, hunting the harp seals, he struggled among the ice floes off the Labrador coast. The man who berths with a "seville" ship lives long in a few weeks, and he knows what it means to see grim death staring at him from every side. He told me of the rare skin of the black fox; how he had hunted him for years in vain; how he had followed him without success, and how, one bright autumn day, he found him at last, dead in his trap. That was Jim's lucky day, and a happy winter followed in the little hut down by the ocean. But another time the single chance of a lifelong quest was lost, when two priceless silver foxes stared at him not ten yards away—and the gun missed fire.

Yes, that night the silent old man talked with a strange, profound emotion. He questioned me concerning life in the great land far away to the southward of England and Europe, and the wild beasts of the African jungles. Notions vague and uncertain were his. I must send on pictures of the lion, the giraffe, and the monster pachyderm, so that he could see them, show them to his friends, and then pin them upon the walls of his kitchen. I told him of the mighty moose which roamed the northern forests of the continent, of the cougar and wapiti, and many old tales of the days of the Indians and bison—tales rapidly changing to traditions. The bleak hills of New-

foundland were left far behind, and we now wandered along the banks of the Mississippi. We scaled the high peaks of the Sierras; we peered over the brink of Niagara, and camped far down in the Grand Cañon of the Colorado. And through it all the old man listened in astonishment and wonder. He was traveling through strange lands and seeing new scenes; but to him it was all "as through a glass darkly." He wanted to learn, but to learn he had never had the chance. All those things which combine to make up our highly organized civilization were things apart from his life; they bewildered that simple mind. The "toot" of a locomotive he had never heard until past fifty; cities, schools, hotels, and paved streets existed only in his imagination, and during a long life of toil he had never contemplated the possible existence of such a thing as a place of amusement—a place where the people laugh and forget—a theatre. Living close to nature's heart, he has never breathed the enervating atmosphere of society, nor has he missed it. His wants are simple and his needs are few. A pipe and a cup of tea are luxuries; but he owns a gun and some dogs, a hut, two dories, and a family of hungry children—nothing more; yet despite it all, no happier man lives in the world to-day. "What are dem bright little streaks up dere?" queried the old man, pointing at the same time to a pale glow in the heavens. And I looked up, and there, over the tops of far off mountains, I beheld the glorious aurora, the midnight sun of the northland, as it shot its brilliant gleams of red and yellow and blue like fiery daggers piercing the blackness of the wilderness night.

That was the last evening spent at Sand Pond, for early on the morrow we turned back homeward bound. Summer had passed, and the brood of young geese on Joe's Neck were gone; so too, were the pips and shell-drakes, the warblers and kingfishers; but jays and ptarmigan were still there, and the old beaver, silent, shy, industrious as ever, was still busily engaged as we left the pond.

On the second day, when traversing the shore of Andrew's Pond, I experienced vague feelings of disappointment and chagrin as we tramped the familiar sandy beach at its lower end and again forded the shallow water of the outlet. We crossed Bear Brook, boiled the kettle at the edge of Gull Pond, and skirted the big barren at the foot of Big Ridge. At the falls four full grown goshawks now circled screaming over the cliffs, the young, fully fledged, apparently as powerful as their parents. I peered over the boulder for a last look down into the pool below. Yes, there they were, still on the spawning grounds, barrels of salmon. And there I left them.

Two days later we stood again on the railroad trestle and looked back over the country which had been our home—thirty thousand square miles of vast, unbroken desolation. Dim and indistinct it seemed, and our little pond was hidden by hills too distant for the power of the eye to discern.

Truly it is a strangely wonderful land; a land of little value figured in dollars and cents, but one peculiar in its fantastic fascinations; a region in which cities will never stand, yet one that we search out in place of the city; a country which bears the charm of the solitudes, of endless marshes and unknown lakes, where the beaver still builds his dams and wild geese nest free and unmolested as a hundred years ago. But a region of broader "leads" and trails well blazed stretched out before me. The train rattled around the curve, and a moment later drew up by the trestle. I shook the hands of my simple, faithful friends of the summer, stepped aboard, and as the locomotive started up speed, William waved his battered cap as a final adieu, and cheerily called back, "You have great pleasure in Newfoundland?"

Yes. Go again I must—back to the old scenes and places. But after it is all over, and the wheels are turning rapidly toward home, when the roar of the falls is but a murmur, and the whisperings of the wilderness are but vague and distant memories, yes, after all, it is not so much what the sportsman brings back in his game-bag that counts, but what he brings back in his heart.

WM. ARTHUR BABSON.

Some Old Guns.

ERIE, Pa.—In the museum attached to the public library are a number of cases filled with old guns, swords, and out-of-date pistols, which I never get tired of examining.

A new specimen was added last week by a gentleman of Erie county. It is probably one of the first attempts at making a revolving rifle; though it is not the first breech-loader, for Hall's carbine is older than this is, I think. The maker's name on it is "P. W. Potter, New York, 1851." A wheel, or solid cylinder, three inches in diameter and half an inch thick is set in the breech just in rear of the barrel. A lever much the same as those that are used in our rifles now, serves to revolve the wheel, and at equal distances on the face of the wheel all the way around it are holes to hold the cartridges, nine of them in all. The caliber is about .40.

What we used to call combustible paper cartridges were, I think, used in this gun; the paper on these did not need to be torn; it was treated with some chemical that caused it to ignite as quickly as the powder would. Common gun caps were used in this gun. They were placed in a small round case that lies close against the wheel on its right-hand side. The hammer is on the outside of this case also, and not on top; it strikes the case sideways, the firing point going through small holes in the case that are opposite the holes that hold the cartridges in the wheel. A short ramrod is fitted on top of the barrel just where the rear sight should be, but a simple movement will throw open the case at the side, the part of it that holds the caps swinging back against the stock. Then the empty wheel can be taken off and a full one put in its place; several wheels were furnished with each gun for that purpose. The empty case could be easily reloaded without taking it off. This is what the ramrod is here for; but it seems to be very much in the way when sighting the gun. I should remove it and replace it with a sight. The gun has a heavy octagon barrel, about 36 inches in length, and it cost when new \$150 in New York.

The history of it as given is that it was bought soon after being first brought out by a gentleman named Allison, who took it west with him, going first to Chicago, which at that time was pretty near the frontier. He shot

deer and other large game on the way there, and afterwards hunted with it through Michigan.

The curator of the museum called my attention to another old gun, but I told him that this one was no curiosity to me. I had used one like it nearly fifty years ago. It was an old style Colt's revolving rifle, one of the first they made; and when it and this wheel gun were placed side by side, it would be hard to tell which of them to choose for every day use now. I would rather have a Marlin, I think; that is, I would if I had any Indians to fight. Both of these guns look to be really out of place now, but then the old flint-locks that hang alongside of them were as much out of date when these came out as are these guns now.

While on the subject of old guns, memory carries me back to two of them that used to hang on deer horns above my grandfather's fire-place at home. One was a bell muzzle Queen's arm which had been carried by his father, then a boy of 16, in the last Stuart Rebellion in England in 1714. This boy's father commanded Prince Charlie's army in that affair, and for having done so lost his head later on in the Tower of London; while the boy, who was probably thought to be too young to be beheaded, was sent to Virginia and told to stay there. He did, but they might as well have let him stay at home, for his son, my grandfather, carried this other gun, a rifle not quite as long as a fence rail, but nearly as long, in the next rebellion against England in 1776, and used it in the battles that were fought around New York and at King's Mountain and the siege of Yorktown.

How a boy not much over 15—that was his age when his father sent him to fight King George—could carry this gun, much less use it, was always a wonder to me. When I was the same age I could not handle it without resting it on top of a fence; that is how I used to manage it when by any chance I could get hold of it.

The old gentleman was out again in 1812, but he left the rifle at home at that time; he had a company in the Virginia Line.

Only one of his sons got into the next war—the war with Mexico; but in the next one, the Rebellion, he was better represented, fourteen of us, his grandsons (three pair of us were brothers), were in the Union Army, and he had several more grandsons who "fit agin us" on the other side.

Zebulon M. Pike.—II.

ON his return to St. Louis, after nearly nine months of the hardest possible work in the north, Pike was allowed but a short rest. Two months and a half later he set out on his western journey, which was to last a year, and during which he was to meet with vicissitudes, which no one could have foreseen. It is not strange that he should have been chosen for the work of exploration in the southwest, which had for its object the investigation of the heads of the rivers flowing through the newly acquired Louisiana, making acquaintance with the Indians inhabiting the region, and putting an end to the constant wars between the different tribes. The good results achieved along the Mississippi had proved his especial fitness for similar work in other portions of the new domain of the United States, and was reason enough for giving Pike the command of this expedition. But it is altogether possible that General Wilkinson, then the commanding officer stationed at St. Louis, in charge of the whole western country, may have had an ulterior object in sending Pike to investigate the Spanish boundaries of the southwest. It has been more than suspected that in some way Wilkinson was mixed up with the Aaron Burr conspiracy. Whether he was so or not, the Spanish authorities of Mexico believed that he was, and believed that the expedition led by Pike, of which they were informed well in advance, was connected with this conspiracy, and had for its object the acquiring of information detrimental to Spanish interests.

At all events the Spaniards had made every preparation to meet Pike, and to capture his party; while Pike himself was intent only on carrying out his instructions to explore the heads of these western rivers, and was ignorant of the existence of Burr's conspiracy. While wintering in the mountains, Pike was taken by the Spaniards and conducted to Chihuahua, and thence through Mexico and Texas brought to the then southwestern boundary of the United States, and there left.

On July 15, 1806, Pike sailed from St. Louis up the Missouri River. With him were a lieutenant, a surgeon—Dr. Robinson—one sergeant, two corporals, sixteen privates, and one interpreter—twenty-one soldiers and two civilians—or twenty-three in all. Several of the party had been with Pike in the north. There were fifty-one Indians who had been redeemed from captivity among the Pottawatomies, and were now to be returned to the Osage and Pawnee tribes, to which they belonged. Two days after leaving St. Louis the party stopped at Mr. Morrison's, and there met a young man named George Henry, who wanted to go west, and after a little time was engaged to accompany the party. He was a good French scholar, and spoke some Spanish.

Progress with the boats, which were rowed up the stream, was of course slow, and Lieut. Wilkinson and Dr. Robinson, with the Indians, marched across the country, while the boats toilsomely pulled up the river. They killed some game, chiefly deer and turkeys. The Indians had a season of mourning each day about daylight, the crying continuing for about an hour. The interpreter told Pike that this was the custom, not only with those who had recently lost their relatives, but also with others who recalled to mind the loss of some friend, dead long since, and joined the other mourners purely from sympathy. They appeared extremely affected; tears ran down their cheeks, and they sobbed bitterly; but in a moment they would dry their cheeks and cease their cries. Their songs of grief ran: "My dear father exists no longer; have pity on me, O Great Spirit! You see I cry forever; dry my tears and give me comfort." The warriors' songs were: "Our enemies have slain my father [or mother]; he is lost to me and his family; I pray to you, O Master of Life, to preserve me until I avenge his death, and then do with me as thou wilt."

On the 28th of July the party reached the mouth of the

Osage River, and on the next day turned up the stream, heading for the Osage villages, where they were to leave a part of their Indians, and were to impress on the Osages the power and importance of the United States Government. Game was quite abundant, and deer and turkeys were killed daily; two, three, five, and on one day even nine deer having been taken, for the large body of men required considerable food.

There was trouble with the Indians from time to time. Some became jealous of their wives, and quarreled with other men; and on one occasion there was some pilfering. But, on the whole, Pike managed the Indians extremely well. On the 14th of August a canoe was met coming down the river, manned by engagees of Mr. Chouteau, of St. Louis, by whom Pike sent letters to General Wilkinson. Relatives of the returned Osage prisoners came out to receive them. The meeting was very tender and affectionate, "wives throwing themselves into the arms of their husbands, parents embracing their children, and children their parents; brothers and sisters meeting, one from captivity, the other from the towns; they at the same time returning thanks to the good God for having brought them once more together; in short, the *tout ensemble* was such as to make polished society blush when compared with those savages, in whom the passions of the mind, whether joy, grief, fear, anger, or revenge, have their full scope."

Sans Oreille (one of the Osages) made them a speech: "Osage, you now see your wives, your brothers, your daughters, your sons, redeemed from captivity. Who did this? Was it the Spaniards? No. The French? No. Had either of those people been governors of the country, your relatives might have rotted in captivity, and you never would have seen them; but the Americans stretched forth their hands and they are returned to you! What can you do in return for all this goodness? Nothing; all your lives would not suffice to repay their goodness." This man had children in captivity, not one of whom the party had been able to obtain for him.

In the Osage village Pike was well received, but a few days in the town and its neighborhood showed him some of the uncertainties of attempting to deal with a strange people. He had great difficulty in purchasing horses for his intended trip to the Pawnees, and where he had secured horses, some of them were stolen from him. However, after considerable difficulty, he got started, taking with him a number of Osages, warriors and chiefs, whom he wished to have make peace with the Pawnees, and also some of the redeemed Pawnee captives. From the very start, however, the Osages were a trouble to him, for they were constantly leaving him to return to their village, urged to do so by dreams or by laziness, or perhaps by fear of what their reception might be among the Pawnees. From the Osage village Pike traveled nearly south along the Osage River for several days; and then turning west, crossed Grand River, a tributary of the Arkansas, and going nearly due west to the head of this stream, crossed over the divide to the Smoky-Hill fork of the Kansas River. Along Grand River game was very abundant, and here we have a glimpse of a quality in Pike which we must admire. "On the march," he tells us, "we were continually passing through large herds of buffalo, elk, and cabrie [antelope], and I have no doubt that one hunter could support two hundred men. I prevented the men shooting at the game, not merely because of the scarcity of ammunition, but, as I conceived, the laws of morality forbid it also."

On September 22 they began to meet Pawnees; and two days later others joined them, who possessed mules, horses, bridles, and blankets, which they had obtained of the Spaniards. Only a few of these Pawnees wore breech cloths, most of them being clad only in buffalo robes. On September 25 Pike had come close to the Pawnee village, which was situated on the Republican fork of the Kansas River, quite a long way above the mouth of the Solomon. Preparations to receive them, and to smoke with the Osages, were made by the Pawnees. The visiting Indians sat down on the prairie, and the whites were a short distance in advance of them. The Pawnees came out from their village, halted about a mile from the strangers, and then, dividing into two troops, charged down upon them, singing their war song, shouting the war cry, rattling their lances and bows against their shields, and in all respects simulating the character of genuine warfare. The two bodies of Pawnees passed around the strangers and halted, and the chief of the Pawnees advanced to the center of the circle and shook hands. One of the Osages offered the chief a pipe, and he smoked. The whole party then advanced to the village, and when near to it again halted. Again the Osages sat down in a row, facing the village, and now some of the Pawnees came to them with pipes and invited one and another to smoke; the Osages did so, and each received from the man whose pipe he smoked a stick, which represented a horse. These Pawnees no doubt belonged to the Republican Pawnees, or Kitkahahk tribe, the second in importance of the three Pawnee tribes.

Four days later a council was held, at which not less than 400 warriors were present. Pike's notes of this interesting occasion were seized by the Spanish authorities later, and he never recovered them. He gives, however, this interesting flag incident: "The Spaniards had left several of their flags in this village, one of which was unfurled at the chief's door the day of the grand council; and among various demands and charges I gave them was that the said flag should be delivered to me, and one of the United States' flags received and hoisted in its place. This, probably, was carrying the pride of nations a little too far, as there had so lately been a large force of Spanish cavalry at the village, which had made a great impression on the minds of the young men, as to their power, consequence, etc., which my appearance with twenty infantry was by no means calculated to remove."

"After the chiefs had replied to various parts of my discourse, but were silent as to the flag, I again reiterated the demand for the flag, adding: 'that it was impossible for the nation to have two fathers; that they must either be the children of the Spaniards or acknowledge their American father.' After a silence of some time an old man rose, went to the door, took down the Spanish flag, brought it and laid it at my feet; he then received the American flag, and elevated it on the staff which had lately borne the standard of his Catholic Majesty. This

gave great satisfaction to the Osage and Kans, both of whom decidedly avow themselves to be under American protection. Perceiving that every face in the council was clouded with sorrow, as if some great national calamity were about to befall them, I took up the contested colors, and told them 'that as they had shown themselves dutiful children in acknowledging their great American father, I did not wish to embarrass them with the Spaniards, for it was the wish of the Americans that their red brethren should remain peaceably around their own fires, and not embroil themselves in any disputes between the white people; and that for fear the Spaniards might return there in force again, I returned them their flag, but with an injunction that it should never be hoisted again during our stay.' At this there was a general shout of applause, and the charge was particularly attended to."

The raising of the American flag by Pike in the village of the Pawnee Republicans on September 29, 1806, marks perhaps the first formal display of that flag by a soldier in the territory west of the immediate banks of the Mississippi River. This has properly been regarded as an occasion of very great importance, and one well worthy of commemoration. The Historical Society of Kansas on September 30, 1901, unveiled with appropriate ceremonies a monument to Pike at Cortland, Kansas, a point which has been identified as the site of the ancient Kitkahahk village at which he stopped, when he held his council with the Indians, and took down the Spanish flag and raised that of his own country.

For some days Pike remained with the Pawnees, and these must have been days of more or less anxiety. The Indians had no sentiments of attachment for either Americans or Spaniards, but they had undoubtedly been much impressed by the greater power of the Spaniards, as evidenced by the expedition which had but just left them, and they were not without fear that wars might occur between the representatives of the different nations, from which wars they would gain nothing, and might lose much. The Pawnee chief endeavored to turn Pike back, saying that he had persuaded the Spaniards to forego their intention of proceeding further to the east, and that he had promised the Spaniards that he would turn back the Americans. He told Pike that he must give up his expedition and return, and that if he were unwilling to do this the Pawnees would oppose him by force of arms. Pike, of course, declined to turn back, and intimated that an effort to stop him would be resisted.

For some days now he was trading with the Indians for horses, but they were unwilling to sell them, and some of those newly purchased disappeared. However, on the 7th of October he marched from the village, moving a little west of south. The lost horses had by this time been returned. On the second day out he was overtaken by about one-third of the Pawnees, who remained with them only a short time. A little later Pike's party discovered some elk, which they pursued; and those running back in sight of the Pawnees were chased by them. "Then, for the first time in my life," said Pike, "I saw animals slaughtered by the true savages with their original weapons, bows and arrows; they buried the arrow up to the plume in the animal."

They met Pawnees from time to time for a few days; and on the 15th, Pike and Dr. Robinson left the party, and lost them, not finding them until the 18th. Their camp was on the Arkansas River, where Pike built boats, to send Lieut. Wilkinson and some men down the river, and so back to the settlements. On the 28th, Lieut. Wilkinson, in a skin canoe, made of four buffalo and two elk hides, and one wooden canoe, proceeded down the river. The party consisted of Lieut. Wilkinson, five white men, and two Osage Indians.

From here for a long distance Pike's route lay up the Arkansas River. Soon they came into a country abounding in buffalo, antelope and wild horses. The antelope were so curious that they came up among the horses to satisfy their curiosity, and the men could not resist the temptation of killing two, although they had plenty of meat. At the report of the gun the game "appeared astonished, and stood still until we hallowed at them, to drive them away." Herds of horses were seen, which came up very close to the command. An effort was made to rope some of the wild horses, but as the animals ridden by the men were slow, and the ropers were without experience, the attempt was unsuccessful; and of this Pike says: "I have since laughed at our folly, for taking wild horses in that manner is scarcely ever attempted, even with the fleetest horses and most expert ropers." The method pursued by the Spanish in Texas to capture wild horses, was not unlike the old Indian fashion of taking buffalo: "They take a few fleet horses and proceed into the country where the wild horses are numerous. They then build a large strong inclosure, with a door which enters a smaller inclosure; from the entrance of the large pen they project wings out into the prairie a great distance, and then set up bushes, to induce the horses, when pursued, to enter into these wings. After these preparations are made they keep a lookout for a small drove, for, if they unfortunately should start too large a one, they either burst open the pen or fill it up with dead bodies, and the others run over them and escape; in which case the party are obliged to leave the place, as the stench arising from the putrid carcasses would be insupportable; and, in addition to this, the pen would not receive others. Should they, however, succeed in driving in a few, say two or three hundred, they select the handsomest and youngest, noose them, take them into the small inclosures, and then turn out the remainder; after which, by starving, preventing them taking any repose, and continually keeping them in motion, they make them gentle by degrees, and finally break them to submit to the saddle and bridle. For this business I presume there is no nation in the world superior to the Spaniards of Texas."

As they proceeded westward they found the prairie covered with buffalo, most of them cows and calves. Pike dilates on their numbers, and speaks of the excellence of the flesh of the buffalo, which he says was, "equal to any meat I ever saw, and we feasted sumptuously on the choice morsels." From time to time they came upon the trail of the Spaniards, returning to their mountain homes, and counted the fires about which these people had encamped. Now their horses were

beginning to grow poor and weak, owing to the scanty pasturage; and now, too, November 12, Pike passed beyond the borders of the present Kansas, and into what is now the State of Colorado.

On November 15, "at 2 o'clock in the afternoon I thought I could distinguish a mountain to our right, which appeared like a small blue cloud; viewed it with the spy-glass, and was still more confirmed in my conjecture, yet only communicated it to Dr. Robinson, who was in front with me; but in half an hour they appeared in full view before us. When our small party arrived on the hill they with one accord gave three cheers to the Mexican mountains. Their appearance can easily be imagined by those who have crossed the Alleghanies; but their sides were whiter, as if covered with snow, or a white stone. Those were a spur of the grand western chain of mountains which divide the waters of the Pacific from those of the Atlantic Ocean; and the spur divides the waters which empty into the Bay of the Holy Spirit from those of the Mississippi, as the Alleghanies do those which discharge themselves into the latter river and the Atlantic. They appear to present a natural boundary between the province of Louisiana and New Mexico, and would be a defined and natural boundary." On the same day they came to the Purgatory River, or River of Souls. Here the Arkansas appeared to carry much more water than below, and was apparently navigable.

GEORGE BIRD GRINNELL.

[TO BE CONTINUED.]

Natural History.

A Knowing Rooster.

"COONEY," a bantam rooster, is the most prominent figure in Seth Worth's boat shop in the shipbuilding village of Port Jefferson, N. Y. As a rule, the more pugnacious a man or beast is, the fewer friends he has; but Cooney's pugnacity and gameness is a large element in rendering him the popular favorite he is. It is so funny to see a little fowl barely six inches high accepting a challenge from a six-foot man, and fighting him to a finish, that the visitor first laughs and then takes the courageous little biped to his heart.

Cooney was hatched on Tuttle street, in February, 1897, and is now therefore seven years old. While still a mere chick his owner moved into the building next to Worth's shop, and Cooney at once made his headquarters in the shop, and refused to be ousted. This was the more singular as sawing and hammering were going on there all day, and there were many visitors. After ineffectual efforts to keep him at home, his master at last gave it up, and Cooney became a fixture of the shop.

Then he enticed his mate, a sober, brown-hued hen, there. Presently the hen made a nest on a pile of shavings in a corner under a work bench, laid a litter of eggs, and in due time hatched three chicks, the other eggs having been addled, no doubt, by the pounding above the nest.

While his mate was setting, Cooney held the fort, and offered the red gage of battle to all who entered. He had a most ungallant and unaccountable antipathy to anything feminine, and many a sedate miss and matron has been forced to beat a hasty retreat with Cooney hanging on to the hem of her gown, sometimes until dragged quite across the street.

One of the chicks died, but two—a cock and a hen—lived. The cock soon showed himself a chip of the old block, and tried to whip his own father. Cooney bore his buffeting and strutting about with exemplary patience for a long time, but at last forbearance ceased to be a virtue, and there was a battle royal. At about the sixth round the young unstart was seen to gasp and beat a retreat with drooping wings to a corner in which some leaning sticks promised protection, and there lay gasping a long time, with a cruel wound from Cooney's spurs in his neck. Nor did he ever recover from the blow.

Cooney is getting to be old now, as birds count age. Last March his mate died, and he was inconsolable. So much did he pine that his master feared he would die, and at an expenditure of thirty-five cents procured another mate for him. She was very much like the first one, and Cooney accepted her as one raised from the dead. His eye brightened, his raiment assumed a livelier hue, and once more his defiant crow resounded through the environs.
